ENCYCLOPÆDIA BRITANNICA, INC.
NEW YORK

INITIALS AND NAMES OF CONTRIBUTORS IN VOLUME XVII WITH THE ARTICLES WRITTEN BY THEM.

A. B. P.	ARTHUR B. PARSONS, B.S. Vice-President, Mineral Research Corporation, New York. Author of numerous articles on technical and economic subjects connected with mining and metal industry.	**Physical Resources** (*in part*).
A. Bu.	ALAN BURROUGHS. Roentgenologist, Fogg Art Museum of Harvard University.	**Paintings, Restoration and Preservation of** (*in part*).
A. C. Se.	A. C. SEWARD, M.A., SC.D., F.R.S. Professor of Botany in the University of Cambridge, and Master of Downing College. Vice-Chancellor of the University, 1924–6.	**Palaeobotany** (*in part*).
A. D.	ALFRED DUNHILL. Chairman and Founder of Alfred Dunhill, Ltd. Author of the *Pipe Book*.	**Pipe Smoking.**
A. de B.	A. DE BOUARD, D-ÈS-L. Professor at the Ecole Nationale des Chartes. Former Member of the Ecole Française de Rome. Honorary Recorder at the Archives Nationales. Author of *Manuel de Paléographie Latine et Française* (in collaboration with Maurice Prou); *Manuel de diplomatique française et pontificale*.	**Palaeography** (*in part*).
A. D. I.	A. D. IMMS, M.A., D.SC. Chief Entomologist, Rothamsted Experimental Station, Harpenden, Hertfordshire. Formerly Forest Zoologist to the Government of India and Professor of Biology, University of Allahabad.	**Phylloxera.**
A. D. M.	A. D. MITCHELL, D.SC., F.I.C. Assistant Editor to the *Journal of the Chemical Society*. Assistant Examiner in Chemistry, University of London and Institute of Chemistry.	**Phosphorus.**
A. E. Bo.	ARTHUR EDWIN BOYCOTT, D.M., LL.D., F.R.C.P., F.R.S. Graham Professor of Pathology, University of London. Director of the Pathological Department, University College Hospital, London.	**Pathology.**
A. E. D.	A. E. DUNSTAN, D.SC., F.I.C., F.C.S. Chief Chemist of the Anglo-Persian Oil Company. Vice-President, Institution of Petroleum Technologists and Late Member of Council of the Chemical Society.	**Paraffin; Paraffin, Chemistry of; Paraffin Oil.**
A. E. W.	ARTHUR E. WELLS. Professor of Metallurgy, Harvard University.	**Physical Resources** (*in part*)
A. G. P.	ARTHUR GEORGE PERKIN, D.SC., F.I.C., F.R.S.E., F.R.S. Emeritus Professor formerly of Colour Chemistry and Dyeing and Dean, 1922–4, of the Faculty of Technology, University of Leeds. Davy Medallist of the Royal Society, 1925. Joint-Author of *The Natural Organic Colouring Matters*.	**Persian Berries.**
A. H. S.	REV. ARCHIBALD HENRY SAYCE, D.LITT., LL.D., D.D. Fellow of Queen's College, Oxford. Professor of Assyriology, Oxford University, 1891–1919. Author of *The Hittites; Early History of the Hebrews; Egyptian and Babylonian Religion; The Archaeology of Cuneiform Inscriptions;* etc.	**Persepolis** (*in part*).
A. H. W.	CAPTAIN A. H. WALKER, R.N. Director of Torpedoes and Mining, Admiralty, 1926–9.	**Paravane, The.**
A. J. H.	ALFRED J. HIPKINS, F.S. Late of Messrs. Broadwood and Sons. Author of *Musical Instruments, Historic, Rare and Unique; History of the Pianoforte and Its Precursors*.	**Pianoforte** (*in part*); **Pitch, Musical** (*in part*).
A. J. L.	ANDREW JACKSON LAMOUREUX. Late Librarian, College of Agriculture, Cornell University, Ithaca, New York.	**Pará.**
A. L. K.	A. L. KROEBER, PH.D. Professor of Anthropology, University of California, Berkeley, Calif. Author of *Zuni Kin and Clan; Anthropology;* etc.	**Pima; Plains Indians.**
A. Lu.	ACHILLE LUCHAIRE. Late Professor of Mediaeval History at the Sorbonne and Member of the Académie des Sciences Morales et Politiques. *See* the biographical article: LUCHAIRE, ACHILLE.	**Papacy** (*in part*).
A. M.	ALLEN MAWER, M.A. Baines Professor of English Language at the University of Liverpool. Director of Survey of English Place Names. Author of *The Chief Elements in English Place Names;* etc.	**Place-Names.**
A. M. A.	A. M. ARNETT, A.M., PH.D. Professor of History, North Carolina College for Women, Greensboro, North Carolina.	**Pierce, Franklin.**
A. Mac.	ALEXANDER MACALISTER, M.A., M.D., LL.D., D.SC., F.S.A., F.R.S. Formerly Professor of Anatomy in the University of Cambridge, and Fellow of St. John's College. Author of *Textbook of Human Anatomy;* etc.	**Palmistry; Phrenology** (*in part*).

C. Pf.	CHRISTIAN PFISTER, D-ÈS-L. Professor at the Sorbonne, Paris. Chevalier of the Legion of Honour. Author of *Etudes sur le règne de Robert le Pieux.*	**Pippin.**
C. S. Pa.	RT. HON. CHARLES STUART PARKER, LL.D., D.C.L. Author of *Life of Sir Robert Peel;* etc.	**Peel, Sir Robert.**
C. T. H. W.	CHARLES THEODORE HAGBERG WRIGHT, LL.D. Librarian and Secretary of the London Library.	**Periodical.**
D. C. Pe.	MRS. C. S. PEEL, O.B.E. Departmental Editor, *Queen.* Editor of *Hearth and Home and Woman.* Managing Director of Beeton & Co., Ltd., 1903–6. Director of Women's Service, Ministry of Food, 1917–8. President, British Housewives Association. Editor of *The Daily Mail Cookery Book.* Author of *Social and Domestic Life of a Century; My Own Cookery Book;* etc.	**Pastry, Home Made.**
D. F. T.	DONALD FRANCIS TOVEY, M.A., MUS.DOC. Reid Professor of Music in Edinburgh University. Editorial Adviser for Music, 14th Edition, *Encyclopædia Britannica.* Author of Essays on *Musical Analysis,* comprising the *Classical Concerto; The Goldberg Variations* and analyses of many other classical works.	**Palestrina, Giovanni Pierluigi da.**
D. H.	DAVID HANNAY. Formerly British Vice-Consul at Barcelona. Author of *Short History of the Royal Navy, 1217–1688; Life of Don Emilio Castelar.*	**Pepys, Samuel** (*in part*).
D. Ke.	D. KEILIN, M.A., D.SC. University Lecturer in Parasitology, Cambridge; Fellow of Magdalene College.	**Parasitology.**
D. Mi.	D. MILRANY. Assistant European Editor of *Economic and Social History of the World War* and special correspondent for South-Eastern Europe for the Carnegie Endowment for International Peace.	**Peasant Movement.**
D. M. S.	DORIS MARY STENTON, B.A. Lecturer in History in the University of Reading. Hon. Secretary and Editor for the Pipe Rolls Society. Author of *The Earliest Lincolnshire Anise Rolls; The Reign of Henry II.;* etc.	**Pipe Rolls.**
D. M. S. W.	DAVID MEREDITH SEARES WATSON, M.SC., F.R.S. Jodrell Professor of Zoology and Comparative Anatomy, University College, London. Author of many papers on Vertebrate Palaeontology and connected subjects in *Proceedings of the Zoological Society*; *Journal of Anatomy;* etc.	**Palaeontology.**
D. R.-M.	DAVID RANDALL-MACIVER, M.A., D.SC., F.S.A. Curator of Egyptian Department, University of Pennsylvania. Formerly Worcester Reader in Egyptology, University of Oxford. Author of *Mediaeval Rhodesia;* etc.	**Picenes.**
E. C. E.	EDWIN CLARENCE ECKEL, B.S., C.E. Consulting Engineer and Geologist. Formerly of the United States Geological Survey.	**Physical Resources** (*in part*
E. C. Q.	EDMUND CROSBY QUIGGIN, M.A. Formerly Fellow of, and Lecturer in Modern Languages and Monro Lecturer in Celtic, Gonville and Caius College, Cambridge.	**Patrick, St.** (*in part*).
E. C. S.	EDMUND CLIFTON STONER, PH.D. Reader in Physics at the University of Leeds. Author of *Magnetism and Atomic Structure.*	**Permeameter.**
Ed. M.	EDUARD MEYER, D.LITT. Professor of Ancient History in the University of Berlin. Author of *Geschichte des Alterthums;* etc.	**Pacorus; Parthia; Pērōz; Persia** (*in part*)**; Persis; Pharnabazus; Phraates; Phraortes.**
E. E. K.	E. E. KELLETT. Author of *Suggestions, Literary Essays; The Appreciation of Literature.*	**Paston Letters** (*in part*).

THE ENCYCLOPÆDIA BRITANNICA

FOURTEENTH EDITION

VOLUME 17

P TO PLANTING OF TREES

P This letter throughout its known history has represented the unvoiced labial stop. It corresponds to Semitic ⅂ (*pe*), Greek Γ, Γ, ⅂ (*pi*). The rounded form occurs in the early Greek inscriptions from the island of Thera. In the Italic alphabets the form varied strangely. The Chalcidic Greek had merely Γ and Γ. Etruscan had ⅂ and P. The Latin alphabet shows two forms Γ and P, one clearly taken from the Greek and the other probably from the Etruscan. The Umbrian alphabet had 1, a form resembling the ancient Semitic. Faliscan had the rounded form 7, Γ. Oscan lengthened the second small vertical stroke and developed the form Π.

The minuscule letter resembles the majuscule, the chief difference being that the loop is brought down to the level of the line of writing and the vertical stroke extended below the line. Thus a cursive form of the 6th century was p, the uncial form was p, the Carolingian p. In modern hand-writing and printing the vertical stroke is extended upwards again, the loop remaining small and on a level with the line, p.

In English and other modern languages the letter is used in combination with *h* in words of Greek origin to denote the unvoiced bilabial spirant, expressed in other words by the letter *f*, e.g., *philosophy, phonetics, graphic.* (B. F. C. A.)

PAARDEBERG, a ford on the Modder River, in the Orange Free State, 23 miles S.W. of Kimberley, was the scene of the surrender of Cronje's force to the British under Lord Roberts on Feb. 28, 1900. After the relief of Kimberley by French's cavalry, Cronje's command, which had been covering the siege, retreated from its position at Magersfontein towards Bloemfontein. The main body of the British infantry was despatched in direct pursuit, and French's cavalry, despite the exhaustion of their horses, moved south-east from Kimberley and successfully headed Cronje off at Paardeberg. An attempt was made on February 18 to rush his laager by a concentric attack from west, south and

THE DEVELOPMENT OF THE LETTER "P" FROM THE EARLIEST TIMES TO THE PRESENT DAY

east; hurriedly organized and insufficiently co-ordinated, it resolved itself into a succession of partial efforts which broke down

before the Boer fire, while an opportune raid by General Christian De Wet was a contributory cause of their failure. Cronje's fate was not averted but only postponed. Attempts to effect his relief by renewed attacks on the investing lines from without failed to break the ring which encircled him; after ten days' investment and bombardment, he surrendered on Feb. 28 with 4,000 men. (*See* also SOUTH AFRICAN WAR.)

PAARL, a town 36 m. by rail E.N.E. of Cape Town, situated about 400 ft. above sea level on the banks of the Berg river, along which it straggles for about 7 miles. To the west of the town are the Paarl mts.; to the east is the Drakenstein range. In and around the town are gardens, orange groves and vineyards. It is a busy agricultural and industrial centre. Fruit and tobacco cultivation is increasing. Wine, brandy, wagons and harness are made. There are several high schools, a training college and an industrial institute. In 1921 the population consisted of 6,395 "coloured" persons, 213 natives, 30 Asiatics, and 5,760 Europeans. By 1926 the latter had increased to 6,678. Paarl was founded in 1687.

PABJANICE, a town of Poland, in the province of Lodz, 30 m. N.W. of the town of Piotrkow, and 10 m. S.S.W. from Lodz railway station. Pop. (1921) 29,700. It lies amidst extensive forests round the head-waters of the Nér, which were the hunting-grounds of the Polish kings. It has woollen, cloth and paper mills, and manufactures agricultural implements.

PABNA or PUBNA, a town and district of British India, in the Rajshahi division of Bengal. The town is situated on the river Ichhamati. Pop. (1921), 19,343. The district of Pabna has an area of 1,678 sq.m. Pop. (1921), 1,389,494. It is bordered along its entire east face by the main stream of the Brahmaputra or Jamuna, and along its south-west face by the Ganges or Padma. Apart from the two great bordering rivers, it is intersected by countless water-channels, so that during the rainy season every village is accessible by boat and many by boat only. Almost the whole area is one green rice-field, the uniform level being broken only by clumps of bamboos and fruit-trees, which conceal the village sites. The Chalan Bil on the west is a marshy area once extending over 400 sq.m. It has been largely filled up by silt deposited by the rivers. The two staple crops are rice and jute.

PACA, a large, heavily-built, short-tailed rodent recognized by its spotted fur. This rodent (*Agouti paca*), together with one or two other tropical American species, represents a genus akin to the agoutis and included in the family *Dasyproctidae*. Pacas may be distinguished by their heavier and more compact build, the longitudinal rows of light spots on the fur, the five-toed hind-feet, and the peculiar structure of the skull. Their habits are similar to those of agoutis. In Brazil the flesh is eaten. Males differ from females in the rough outer surface of their cheek-bones. The paca-rana (*Dinomys branicki*), from the highlands of Peru, differs by its well-developed tail and the arrangement of the spots. (*See* RODENTIA.)

PACATUS DREPANIUS, LATINUS (or LATINIUS), one of the Latin panegyrists, flourished at the end of the 4th century A.D. He probably came from Aginnum (Agen), in the south of France. He was the contemporary and intimate friend of Ausonius, who describes him as the greatest Latin poet after Virgil. In A.D. 390 he was proconsul of Africa. He is the author of an extant speech (ed. E. Bährens in *Panegyrici latini*, 1874, No. 12) delivered in 389 in honour of Theodosius I.

PACCHIA, GIROLAMO DEL (1477–after 1535), Sienese painter, son of a Croatian cannon-founder, was born in Siena. In early life he visited Florence and Rome, returning to Siena in 1508. His fine altarpiece in the church of S. Christoforo reveals the influence of Raphael and Fra Bartolommeo. He was, however, an eclectic, and came more and more under the influence of Sodoma. In company with that master and with Beccafumi, he worked at the frescoes in the oratory of S. Bernardino. Other works are in the Oratory of S. Caterina in Fontebranda, in the Siena gallery, and in the National Gallery, London. Having joined the notorious company of the Bardotti, he is supposed to have fled upon the suppression of that turbulent club in 1535, and nothing further is known of him.

PACHECO, FRANCISCO (1564–1654), Spanish painter and art historian, was born at Sanlúcar de Barrameda, where he was baptized on Nov. 3, 1564. He went early to Seville, where he lived with his cousin, F. Pacheco, a canon whose house was a meeting place of the learned and artistic world of the town. Pacheco studied art under Luis Fernandez. It is not known whether he went abroad, but he greatly admired Italian art and formed a collection of Italian Renaissance drawings. Later he opened an academy which was largely attended. Of his pupils the most distinguished were Alf. Cano and Velazquez, who became his son-in-law. His early work is hard and cut out; after a visit in 1611 to Madrid and Toledo, where he met Greco, he became interested in the problem of chiaroscuro. Specimens of his work are to be seen at Seville in the gallery, the university and the cathedral. The church of St. Sebastian at Alcala de Guadaira, near Seville, contains one of his most important works. He was a successful portraitist and is said to have executed 150 portraits. Pacheco visited Madrid again in 1623 in the company of Velazquez and stayed there for two years. In his later life he devoted himself to writing. His treatise on the art of painting (*Arte de la pintura,* 1640) is of considerable value for the study of Spanish art.

PACHER, MICHAEL (*fl.* 1465–1498), German painter and wood carver. His chief work was the great altarpiece in the parish church of St. Wolfgang, in Upper Austria, commissioned by the abbot Benedict Eggh of Mondsee and executed between 1478–81. It is one of the greatest monuments of the late German Gothic period. The centrepiece is an elaborate wood carving representing Christ and Mary with St. Wolfgang and St. Benedict. The wings, two on each side, are painted with scenes from the life of Christ and of St. Wolfgang. While the carving is of the late Gothic style prevalent in Germany at the time, the paintings are influenced by the Italian Renaissance, which penetrated into the Tirol from Verona. The figures are plastic, the composition clear and monumental.

Other works by the master are: The altarpiece (wood carving) in the church of Gries, near Bozen (1471); the high altar for the church of St. Francis, in Salzburg, begun in 1484 and left uncompleted; and the altarpiece of the cathedral at Brixen, representing the fathers of the Church, panels of which are in the Munich and Augsburg galleries.

See O. Doering, *Michael Pacher* (München, 1913).

PACHMANN, VLADIMIR DE (1848–), pianist, was born on July 27, 1848, at Odessa, Russia, where his father was a professor at the university. His first musical instruction was on the violin at the age of six and it was not till he was ten that he began the serious study of the piano, under Dachs, at Vienna. He made his first appearance in Russia in 1869, but afterwards withdrew from the platform and continued his studies for a number of years; then, reappearing, he obtained at once universal recognition as one of the most remarkable executants of the day. As an interpreter of Chopin in particular he has always excelled, while his amusing platform mannerisms and eccentricities, taking the shape of audible comments on the music, comic gestures, and so on have added to his popularity.

PACHOMIUS, ST. (292–346), Egyptian monk, the founder of Christian cenobitical life, was born, probably in 292, at Esna in Upper Egypt, of heathen parents. He served as a conscript in one of Constantine's campaigns, and on his return became a Christian (314); he at once went to live an eremitical life near Dendera by the Nile, putting himself under the guidance of an aged hermit. After three or four years he was called (by an angel, says the legend) to establish a monastery of cenobites, or monks living in common. (*See* MONASTICISM, § 4.) Pachomius spent his life in organizing and directing the great order he had created, which at his death included nine monasteries with some three thousand monks and a nunnery. The order was called Tabennesiot, from Tabennisi, near Dendera, the site of the first monastery. Athanasius was his firm friend and visited his monastery *c.* 330 and later. The date of his death was probably in 346.

The best modern work on Pachomius is by P. Ladeuze, *Le Céno-*

bitisme pakhomien (1898). There have been differences of opinion in regard to the dates; those given above are Ladeuze's, now commonly accepted. The priority of the Greek *Life* of Pachomius over the Coptic may be said to be established; the historical character and value of this life are now fully recognized. A good analysis of all the literature is supplied in Herzog's *Realencyklopädie* (ed. 3). *See* also W. E. Crum, *Theological Texts from Coptic papyri* (1913).

PACHUCA, a city of Mexico and capital of the State of Hidalgo, 55 m. direct and 68 m. by rail north-north-east of the city of Mexico. Pop. (1921) 40,802. Pachuca's railway connections include the Mexican, the Hidalgo and the Mexican Oriental. The town stands in a valley of an inland range of the Sierra Madre Oriental, at an elevation over 8,000 ft. above the sea, and in the midst of several very rich mineral districts—Atatonilco el Chico, Capula, Potosí, Real del Monte, Santa Rosa and Tepenené. It is said that some of these silver mines were known to the Indians before the discovery of America. It was here that Bartolomé de Medina discovered the "patio" process of reducing silver ores with quicksilver in 1557, and his old *hacienda de beneficio* is still to be seen. Pachuca was founded in 1534, some time after the mines were discovered. The city has some fine modern edifices, among which are the palace of justice, a scientific and literary institute (now a university), a school of mines and metallurgy, founded in 1877, a meteorological observatory and a public library. Mining is the chief occupation. Electric power is derived from the Regla Falls, in the vicinity. The city's industrial establishments include smelting works and a large number of reduction works, including some of the most important metallurgical works in the republic.

PACHYDERMATA, a term often applied to thick-skinned animals, such as the rhinoceros, elephant and hippopotamus. The animals included by it have no close affinities.

PACIFIC, COMMAND OF THE. The development of the strategic situation in the Pacific ocean, as it now exists, may be said to have begun in 1894 when a victorious Japan eliminated the Chinese navy as a serious factor in the balance of sea-power. Three European sovereignties then proceeded to establish bases in the Far East, Russia at Port Arthur, Germany at Tsingtao, the naval fortress of Kiaochow on Shantung, and Great Britain at Weihaiwei. During this period, the most serious rivalry lay between Russia and Japan, each intent upon the control of Korea, and in 1904–05 the issue was resolved by a war in which Japan eliminated the Russian navy in the Far East as completely as the Chinese navy had been eliminated ten years before. Japan was left in undisputed mastery of Asiatic waters from Kamchatka in the north to the Philippine archipelago in the south.

In 1902 Great Britain concluded an alliance with Japan and so safeguarded her interests in the Far East. The British force on the China station was reduced, therefore, to a mere cruiser squadron. While Germany continued to fortify Tsingtao as a refuge for her small Asiatic fleet, it was clear that her forces, whether on land or sea, did not materially affect Japan's supremacy in armaments. At Manila in the Philippines the United States kept a few secondary ships of war, but took no steps to develop the naval resources of this fine harbour. Guam, an American island of the Marianas group, lying 1,500 m. to the east of the Philippines, ranked only as a fuel station, though its position invested it with unique strategic value.

This situation continued, substantially unchanged, from the year 1905 when the Treaty of Portsmouth was signed between Russia and Japan, and the outbreak of the World War in 1914. The Far Eastern seas, which had long been the arena of conflicting claims to supremacy, had now passed definitely and, as it seemed, permanently, under the control of a single Power. Subsequent events have tended to consolidate the strategic predominance of the Japanese empire. The conquest of Tsingtao early in the World War eliminated the only German stronghold in the Pacific. Domestic convulsions in Russia, by apparently reducing the naval forces of that State to impotence, have rendered still more remote the prospect of Vladivostok again becoming the headquarters of a formidable fleet.

In order to understand the new position, it is necessary to appreciate what the naval strategist means by "radius of fleet action." Modern fighting ships have a narrow radius of action, dimensioned by their relatively meagre fuel capacity. In time of war individual cruisers may roam the sea for weeks, even for months, at a stretch, replenishing their bunkers as opportunity offers. This, however, is not possible for an organised fleet, attended by the smaller craft which are essential as watch-dogs to the heavy ships. From experience gained in the World War it is estimated that a battle-fleet with its proper complement of ancillary units can remain at sea under war conditions not longer than four days. To be within reach of attack the objective must not be farther away than two days' travel at ordinary speed. To all intents, a battle-fleet within the war zone is restricted to a cruise of 96 hours.

These essential facts demonstrate the intimate relation between strategy and geography. In the vast expanse of the Pacific ocean, every problem of naval strategy involves the question of base facilities, and the broad consideration to be faced is that in consequence of recent international negotiations, the number of potential naval bases in the Pacific has been substantially increased, with the result that squadrons, if not whole fleets, may henceforth be able to operate in waters which formerly lay beyond their reach. It is true that a great many of these islands are mere atolls, affording little or no shelter for large vessels, and lacking even the most rudimentary naval resources. An important part was played in the South Atlantic operations of the British fleet during the World War by the remote coaling base at Abrolhos Rocks, off the Brazil coast.

Hence, the direct bearing of the Treaty of Versailles on the naval problems of the Pacific. Under that treaty, the former German islands north of the Equator passed into the custody of Japan, while those south of the Equator were transferred to the British empire. As an element in naval strategy, these islands possess an immense potential importance. Since 1919 Japan has exercised mandatory powers over several island groups situated far out in the Pacific. Strategically, her most important acquisitions are the Peleliu islands (500 m. east of the Philippines); the Carolines; the Marianas islands, excepting Guam, which is American territory; and the Marshall group, these latter being some 1,700 m. to the southwest of Hawaii. Light naval vessels, aircraft and submarines, judiciously distributed among the islands named, would represent a serious menace to a hostile force advancing towards Japan from the east.

It is thus essential to note that under the mandate of the League of Nations, the use of these islands for warlike purposes and their fortification are forbidden. Of equal significance have been the results of the Washington Conference (*q.v.*). The covenants there arrived at in 1922 not only reduced the battle-fleets of the leading naval Powers according to a definite schedule, but they deal also with naval bases and have in some degree nullified the effect of the territorial changes in the Pacific for which the Versailles Treaty was responsible. Under the Washington Treaty the British empire, the United States and Japan agreed to maintain the *status quo* as to fortifications and naval bases in a series of highly important strategic positions in the Pacific. The United States, for example, is pledged not to improve in any way the shore defences or naval works in the Philippines, Guam or the Aleutian islands; Japan accepts the like obligation in regard to the Bonin islands, Formosa and other insular possessions; while the British empire is debarred from adding to the naval resources of Hongkong.

The Hawaiian islands are also exempted, though they are more than 2,000 m. from the American mainland. Their position makes them invaluable as the pivoting centre of a fleet charged with the task of defending not only the western seaboard of the United States but the outlying territories of Alaska and Samoa.

The zone of agreement demarcated at the Washington Conference begins east of the meridian of 110° E. long. Singapore lies just outside this limit and is thus not subject to the pledges against fortification. First utilised as a naval harbour in 1882, Singapore has been for many years the southern base of the British China Squadron. Over the development of Singapore as the naval base of a battle-fleet, there has been serious controversy

in Great Britain, successive Governments, Conservative and Labour, taking different views. The new dockyard was begun in 1924–25, and was advocated on grounds mainly, if not entirely, defensive. The contention is that Singapore is regarded by Australia and New Zealand as the United States regards Hawaii. A naval station at Singapore would be an indirect but none the less effectual deterrent to plans, if they should ever be considered, for the invasion of Australia or New Zealand. The susceptibilities of these Dominions have been aroused somewhat by the nonrenewal of the Anglo-Japanese Alliance.

Since the Washington Conference, competition in battleships has been abated. But additional attention has been directed to cruisers, of which Japan has constructed a powerful contingent. The range of action of cruisers has become a factor on which experts lay great emphasis. By Great Britain, with her numerous coaling stations and her interest in confined waters like the Mediterranean, small cruisers are held to be most useful. But the United States, surveying an ocean like the Pacific, which extends from the Arctic to the Antarctic regions, and has a breadth as great as 10,000 m., and covers nearly one-half of the surface of the earth, is anxious for cruisers of the largest size; that is 10,000 tons. The Panama canal has enabled the United States to operate her fleet in two oceans, the Atlantic and the Pacific, and it is to the Pacific ocean in particular that she has devoted her naval developments. The fleets of the United States and Japan in the Pacific have become, therefore, the major determinants of the strategic situation. But, in the main, these imposing forces are dependent on shore communications, which shores are separated by thousands of miles. Even Hawaii and Singapore are outside of a fighting radius that would include Japan. No single Power or group of Powers, therefore, has achieved an absolute control of this vast area of sea. Up to the present, the Latin American Republics, bordering on the Pacific, for instance Chile and Peru, have not organized naval forces that seriously affect the situation. (*See* SINGAPORE; WASHINGTON CONFERENCE, etc.)

PACIFIC BLOCKADE, a method of coercion short of war exercised by a great Power for the purpose of bringing pressure to bear on a weaker state. That it is an act of violence, and therefore in the nature of war, is undeniable. In this respect it is an act of war, and may be so regarded by a power strong enough to resist. On the other hand, the object and justification of a pacific blockade being to avoid war with the state against which the operation is carried on, rights of war cannot consistently be exercised against ships belonging to other states than those concerned. And yet if neutrals were not to be affected by it, the coercive effect of such a blockade might be completely lost. Recent practice has been to limit interference to the extent barely necessary to carry out the purpose of the blockading powers.

The earliest recorded instance of pacific blockade is the Anglo-Swedish blockade of Norwegian ports in 1814. This was succeeded by the intervention of France, England and Russia in Turkish affairs in 1827, and, in 1837, by Great Britain against New Granada.

The Declaration of Paris, 1856 (*q.v.*), however, required that "blockades in order to be binding must be effective; that is to say, maintained by a force sufficient really to prevent access to the coast of the enemy."

The blockade which first gave rise to serious theoretical discussion on the subject was that instituted by France in 1884 in Chinese waters. On Oct. 20, 1884, Admiral Courbet declared a blockade of all the ports and roadsteads between certain specified points of the island of Formosa. The British Government protested that Admiral Courbet had not enough ships to render the blockade effective, and that it was therefore a violation of the Declaration of Paris, 1856. Moreover, the French Government could only interfere with neutral vessels violating the blockade if there was a state of war. If a state of war existed, Britain as a neutral was bound to close her coaling stations to belligerents. The British Government held that in the circumstances France was waging war and not entitled to combine the rights of peace and warfare for her own benefit. Since then pacific blockades have only been exercised by the great Powers as a joint measure in their common interest, which has also been that of peace; and in this respect the term is taking a new significance in accordance with the ordinary sense of the word "pacific." The penalty for breach of pacific blockade by neutrals is detention or sequestration. In no event may ships be confiscated.

By the Hague Convention (II. 1907) respecting the employment of force for the recovery of contract debts, the contracting powers agree "not to have recourse to armed force for the recovery of contract debts claimed from the government of one country by the government of another country as being due to its nationals," unless "the debtor state refuses or neglects to reply to an offer of arbitration, or after accepting the offer prevents any *compromis* from being agreed on, or after the arbitration fails to submit to the award" (Art. 1). Though this does not affect pacific blockades in principle, it supersedes them in practice by a new procedure for some of the cases in which they have hitherto been employed. (T. B.; H. H. L. B.)

PACIFIC HIGHWAY, an American highway running along the western border of the United States from Vancouver, Canada, to the Mexican boundary line south of San Diego, Calif., about 1,675 m. long. It is paved or hard the entire distance. The sea or mountains are within view of the highway from end to end. It passes Mt. Rainier, Crater lake and the Mt. Lassen volcano.

PACIFIC ISLANDS (OCEANIA). The Pacific islands, also sometimes spoken of collectively as Oceania or even Oceanica, may from a geographical point of view, be described as including all the almost innumerable "oceanic" islands, as distinguished from the "coastal" archipelagoes adjoining the shores which more or less surround the Pacific Ocean, *i.e.*, those which obviously pertain physically to the coasts of Australia with its Territory of Papua, and those of New Zealand, and the shores of America on the east and again on the west of this great ocean.

No entirely satisfactory classification of these islands seems to have been suggested. The one most commonly put forward is to treat them as divisible, in accordance with the native races found in occupation at the time when Europeans first entered this area, into the three areas of Polynesia, Melanesia, and Micronesia; Polynesia (Gr. πολύς, many, and νῆσος, island) being the eastern part of the area embracing Hawaii, the Ellice, Phoenix, Union, Manihiki and Marquesas groups, the Cook, Society, Tubuai and Tuamotu groups and many other lesser islands; Melanesia (Gr. μέλος, black, and νῆσος, island), being the area in the western and south-central area embracing in some interpretations New Guinea and the Louisiade islands and, in addition, the Solomon, Santa Cruz, New Hebrides, New Caledonia and the Loyalty islands, the Fijian islands, and the intervening groups; Micronesia (Gr. μικρός, small, and νῆσος, island), the third and smallest of the divisions lying north and somewhat east of Melanesia, and embracing the Marianas, Palau (Pelew), Caroline, Marshall and Gilbert islands.

The Structural Arcs and Geology.—Several great zones of deep water may be traced in the Pacific Ocean. The first is east of the Ryukyu islands and the Philippines, and beyond it far out to sea rise the island chains which stretch in scattered order from south-east Hondo, Japan, to the Ogasawara Jima (formerly sometimes called Bonin islands) between lat. 28° and 26° 30′ N., the Volcano islands (lat. 25°–24° N.), the Marianas, Yap and the Palau (Pelew) islands.

Islands of the Asiatic Continental Edge.—The Ogasawara Jima include nummulitic limestone with ancient igneous rock and there are also newer (horizontal) limestones abutting against the above. The Volcano islands are said to continue the line of Fujiyama. In the southern Marianas' terraces of coral formation rise to the summits, but in the north the coral is restricted to the bases. Yap

is formed of basic volcanic material. The Palau islands have a volcanic foundation on which rests a fossiliferous limestone that is more or less crystalline. Malakal in this archipelago reaches a height of over 1,600 feet and syenitic pebbles occur even on this high ground. The island chains above discussed have been thought by Suess to mark the limit of the continental mass of Asia, in which case they may be said to mark the edge of the easternmost of a series of steps, the edges of which may be indicated by the Ryukyu, Corea and the Khingan Mts. Beyond the Ogasawara Jima-Palau zone to the east is one of the world's chief lines of sea-deeps, 4,000 fathoms being much exceeded over long distances.

Western Pacific Arcs. Introductory.—From the south-east of the Marianas another zone of deep water extends north-eastwards to the west-north-west end of the Hawaiian chain, beyond which again is another great deep. From the east-south-east end of the Hawaiian chain another zone of deeps extends south-south-westwards to the vicinity of East Cape, New Zealand with a south-eastward extension east of Chatham island (*q.v.*). The expanse of ocean extending south-westwards between the two deep zones, Marianas-Hawaii and New Zealand-Hawaii, is marked by islands set in arcs. These arcs are rather a series of overlapping sub-parallel lines than strictly continuous curves. Arcs of the western Pacific farther and farther away from Australia show less and less traces of continental land, and mountain folding and volcanic lines, usually with atolls, are all that remain. The western Pacific arcs have been thought to be in relation with those of both New Guinea and New Zealand.

Western Pacific Arcs. I. New Guinea, New Caledonia.—This arc may be traced through the Louisiade islands, a prolongation of south-east New Guinea, New Caledonia, with the Loyalty islands near by, and Norfolk island, perhaps to north-west New Zealand. New Caledonia has a band of Archaean and Palaeozoic rocks running almost the whole length of the island from north-west to south-east, while what are probably Eocene beds fringe the south-west coast. Much of the old rock is slate or schist with serpentine, granitic and basic volcanic intrusions. The slates are interbedded with limestones containing fossil brachiopods, referred to the Trias. There are evidences of submergence and a wide-lagoon barrier reef. There is a general geological resemblance between New Caledonia and New Zealand. The main mineral veins are of nickel (garnierite) in the eastern peridotite dikes. The Eocene rocks disappear in places beneath the older ones, thus demonstrating overfolding, the direction of which may have been south-westwards. There is thus no doubt that here is a remnant of a folded mountain chain. Some of the fossils found in New Caledonia are northern forms.

Western Pacific Arcs. II. New Britain Archipelago. New Hebrides.—This is traceable especially through New Ireland, the Solomons and Santa Cruz to the New Hebrides.

New Ireland possesses porphyries, diorite, some dark calcareous rock and some grey rather crystalline limestone reaching nearly 2,500 feet above the sea. The south of New Ireland is volcanic but, to the north, sedimentary rocks rest on an ancient mass which is scarped towards the south-west and probably represents the most easterly of the New Guinea folds. The other islands of the New Britain group, as well as the Admiralty islands, are volcanic, with recent coral. The features of New Ireland, including the grey limestone, are continued along the chain to the New Hebrides, and the limestone, containing *Rhynchonella* sp., is thought to be Mesozoic. Several active volcanoes occur at what appear to be breaks in the chain which may be considered a fragment of a cordillera. Former statements as to ancient rocks in the New Hebrides have not been confirmed.

Western Pacific Arcs. III. Caroline Islands, Marshall Islands, Fiji.—The general direction of the chain from the Marshall islands to Fiji north-north-west to south-south-east and the relation of the Fijis to the others may not be simple because of the interference of the Samoan line discussed below. The Fiji islands are mainly volcanic including many tuffs interstratified with tertiary limestone and resting on limestone older but still tertiary. In the south of Viti Levu is a high granitic plateau which is said to be a horst. Vanua Levu has hot springs. Fiji yields malachite, antimony, graphite, gold in small quantities, and specular iron sand. W. M. Davis has made a special study of the coral reefs of Fiji and thinks that they are formed by the method inferred by Darwin. He also notes that on the south-west side of Viti Levu and on the south side of Vanua Levu there are raised reefs and fringing reefs but no barrier reefs off shore; while on the north and north-west sides of the island there are off-shore barrier reefs but no raised reefs. The Ellice, Gilbert and Marshall islands north of Fiji are volcanic with coral atolls. The politically-famous Nauru island (Pleasant island) lies south-west of the Marshall group. The Carolines, west of the Marshalls, include several small chains not quite parallel to the main direction of the whole arc; it has been surmised that they are built upon a deeply foundered fold system.

Western Pacific Arcs. IV. New Zealand, Tonga.—The Ruahine chain of New Zealand is a scheme of fold mountains with a palaeozoic axis parallel to the east coast of North island, New Zealand. To the west of it lies a volcanic zone including the peaks of Ruapehu and Tongariro, Lake Taupo, Rotarua, and the bay of Plenty with the volcano of White island. The line is continued north along the Kermadec to the Tonga islands. The western side of the Tonga chain is highly volcanic; Hongu-tonga and Hongu-hapai appear to be fragments of a single crater, and Toqua Kao, Late, Metis, Amargua and Falcon islands are also purely volcanic; the rock is basic. Tonumeia and the Nomuka group (Mango, Nomuka-iki, etc.) have coral limestone over submarine volcanic deposits of tuffs, penetrated by basic volcanic dikes. The Vavau group, Tongatabu and Hapai do not show a volcanic substratum. Metis and Falcon islands are usually submerged.

Samoa, Tokelau Is., Phoenix Is.—The fourth arc just discussed is bounded by a long sea-deep which however has its continuity broken just where certain Polynesian island-chains cut it north of the Tonga islands. The chief of these is the Samoan group but the Tokelau (Union) islands and apparently the Phoenix islands may be mentioned here.

The Samoan chain shows vulcanicity, oldest in the east where the craters have disappeared, less old in the centre where they form peaks, and obviously very recent in the west.

The Eastern Polynesian Chains, orientated west-north-west to east-south-east have as a foundation a plateau submerged beneath 700–800 fathoms of water, on the east side of the zone of great depths. The island-chains diminish and disappear south-eastwards and here the ocean becomes 2,000 fathoms deep and more. The Austral and Cook islands are the most south-westerly chain. The Society islands (Tahiti) form the middle one and include some atolls but are mainly a basic volcanic group. Tahiti, itself ringed by strong cliffs with much evidence of submergence, has a discontinuous barrier reef off-shore. Here the submergence is older than in the Marquesas and the embayed valleys are filled with alluvium. Though all volcanic activity has now ceased, remains of plants and animals now living in the islands are found beneath some of the lava flows, so vulcanicity is recent. The north-easterly chain is that of the Tuamotu or Low Archipelago, in which Makatea (Metis) reaches a height of some 230 feet. Most of the islands are atolls which Agassiz thought were built on denuded summits of Tertiary limestone, cut at about sea-level. The Manahiki islands farther north-west may be related to the Tuamotu.

The Marquesas and Isolated Groups.—Beyond the Tuamotu group to the north-east lie the Marquesas showing basic volcanic material deeply dissected and recently so altered by submergence that only fragments of coral are found in the bay-head beaches. The New Zealand-Hawaii zone of great depths is cut between the Equator and lat. 10° N. by the low atolls of Christmas, Fanning, Samarang, Palmyra and Barber islands arranged more or less north-west to south-east. East of the eastern Polynesian chains lie Easter island and Sala-y-Gomez island south of the Tropic of Capricorn, and the Galapagos islands on the Equator. All are volcanic in origin and may possibly be compared rather with the oceanic islands of the Atlantic than with the island chains of the rest of the Pacific.

The Hawaiian chain is treated separately. (*See* HAWAII.)

General Physical Geography.—Volcanic islands, commonly called high islands, are widely distributed throughout the area of Oceania except in the extreme eastern parts, where "low islands," coralline atolls, are much more, indeed extraordinarily frequent. The high islands of the Marquesas and the Society (Tahitian) groups are types of extinct volcanic islands. In the long chain of the Solomon islands, in the New Hebrides, in the Tongan group there are still active volcanoes and Hawaii contains the celebrated active crater of Kilauea. In many other places at which only tradition tells of eruption it would hardly be safe to assume that activity might not again burst out. Submarine vents sometimes break out; the most remarkable instance of this is that of the so-called Falcon island (lat. 20° 19′ S., long. 175° 25′ W.), in the Tongan group. In the *Pacific Islands Pilot*, vol. ii., it is recorded that this was first seen as a breaking reef, from H.M.S. "Falcon," in 1865; from the position of this reef smoke was seen to issue, by H.M.S. "Sappho," in 1877; in October 1885 the reef was reported to have taken on the form of an island; four years later this island was actually surveyed by H.M.S. "Egeria," and found to be 1¼ miles long north and south, one mile wide, wedge-shaped, the highest part, 153 feet above sea-level, being at the south end. It was formed of loose volcanic ashes and cinders, which material was constantly slipping down, as the action of the sea undermined the coast. By 1885 two-thirds of the island had disappeared; and by April 1894 nothing was to be seen where Falcon island had been but a low streak of black rock, invisible at night. But in December of the same year renewed "volcanic action had formed a new crater, with the result that the island was then fifty feet high, three miles long and one and a half miles broad, the surface being still quite hot. In 1895 the island had again disappeared, its place occupied by a shoal about a hundred yards in extent breaking heavily. In April 1900, the shoal which had been the island was showing about nine feet above water at its northern end." In 1905, as the present writer can testify, the shoal was barely more than a waste, and in 1913 it was officially reported as "non est." In 1926 or 1927 the island, or rather the shoal again appeared, but is said to have disappeared again.

Coral Formations.—Coral reefs, like volcanoes, are dealt with under special articles, but here it must be noted that coral, in one or other of its several forms, is present, not everywhere but more abundantly than in any other ocean, in the Pacific island-area, more especially in the eastern portion of that area. The main type-forms in which it appears are as follows: *atolls, i.e.*, rings of coral surrounding a central lagoon; *barrier reefs, i.e.*, such as front a coast-line or encircle an island or group of islands, leaving a more or less deep channel between it and the shore; and *fringing-reefs, i.e.*, such as are extensions of the shore, generally for a short but sometimes for a more considerable distance, and not separated from the shore by any deep water channel.

As to the atolls it must be added that often one or more, or even many, of the highest parts of these may be more or less raised higher than the general sea-level of the ring, so that from a distance these higher parts, especially after vegetation has been attracted to them, may appear from a little distance as distinct islands, and in many cases have been so reported and named.

In other cases, again, what must originally have been atolls have been raised, sometimes more than once, and have thus become what have been called *elevated coral islands;* a good example of this is the island of Maré, of the Loyalty group, where there is evidence of three such elevations, so that three former reefs appear as distinct low cliffs, separated from the sea by low and level coast-tracts.

Flora.—In any general consideration of the flora of the islands it is necessary to distinguish between the rich vegetation of the fertile volcanic islands and the scanty vegetation of the low coral islands, especially of the atolls often only here and there raised slightly above sea-level. Of the plants not purposely brought in by human agency most must have been introduced by the wind or by ocean currents or by migratory birds, from one or other of the shores surrounding the ocean. The large but buoyant fruits of the coco-nut palm and of the "screw pine" (Pandanus), ocean-borne, found foothold on the coral rock barely raised over sea-level, and became the predominant vegetation of the low lands; doubtless the fact that both were found to offer an important food supply for vegetarian natives led to their being extensively planted by human beings in rather more inland parts, and even, as in some of the New Hebrides, far up on the hillsides. On the other hand, the wind-borne spores of mosses and ferns, the winged seeds of many shrubs and trees, and the bird-carried, comparatively large fruits of many other plants found favourable homes in the higher volcanic islands, especially on the most westward slopes, with the result that in time many slopes have acquired typical intertropical rain forests. It need hardly be said that there is no hard and fast line between the coastal and the mountain vegetation of the high islands which are more or less fringed by level coastal tracts; an instructive study of the merging of coastal and mountain vegetation is found in Lilian Gibbs' "Montane Flora of Fiji" (*Linn. Soc. Journ. Botany,* xxxix., 1909).

Marvellously beautiful as this original vegetation of the islands is, it must not be overlooked that the profusion of fruits, flowers and beautiful leaves now to be seen in the inhabited parts of the islands has not been brought about by natural means. The natives in their early migrations certainly carried with them not only food and other plants useful to them but also plants valued by them for ornament; that is to say they grew them round their houses and used the flowers and leaves—especially such as are scented—lavishly in dressing themselves for their ceremonies. Still more have Europeans since their arrival in the islands been responsible for the introduction of non-native plants, both useful and ornamental; a good illustration of this is to be found in the late J. H. Maidon's paper on the "Flora of Norfolk Island" (*Proc. Linn. Soc. of New South Wales,* Vol. xxviii., pp. 692–785 [1903]), in which is shown the extent to which the abundant natural vegetation of that island, as seen by Captain Cook, the earliest European visitor, and by other early visitors, has been almost smothered by the useful and ornamental plants introduced during the first half of the last century from Australia.

Fauna.—The indigenous land fauna is exceedingly poor in mammals, which are mainly represented by rats and bats. The pigs, so much treasured by the natives of the Solomon and New Hebrides islands, were supposed to have been introduced by Captain Cook, but it now seems more probable that they are descended from a Papuan form brought by the Melanesians in their southward migration into the Pacific. Cattle and horses when first introduced—certainly by the early navigators—seemed not to thrive under domestic conditions; but when, as has happened in some of the larger and more mountainous islands, they ran wild, they increased rapidly; and more recently, when suitable fodder plants were introduced for their benefit, they have thriven greatly even in a domestic state.

Birds are much more numerous than mammals, among the most important kinds being pigeons and doves, especially the fruit-eating pigeons, responsible as these doubtless have been for the distribution of the fruits from which many of the island plants have originated. Birds of specialized form occur in several of the island groups; Megapodes in the Solomon islands, the New Hebrides, Samoa and Tonga, as also in the Carolines and the Marianas. The remarkable Didunculus occurs in Samoa, and after the introduction of cats and rats, which preyed upon it, was compelled to change its habits from living on the ground to living in trees.

Insect life has been said to be fairly abundant but unequally distributed throughout the islands; as a matter of fact, except in the Solomon and Hawaiian islands, and more recently in the Fijian group, where the subject has been more particularly studied, little more than a general knowledge of the insect fauna is available.

The marine fauna of the area is much richer than that of the land. Fish are very abundant, especially in the lagoons of atolls, and form an important article of food for the natives, who are generally expert fishermen. The gorgeous colour of many of the species of fish is noticeable, as also the fact that the flesh of certain species of fish is poisonous at certain seasons of the year, but not at other times. Turtles are also abundant. Among

marine mammals the dugong occurs in the northern parts of the area; and whales traverse the waters of the area at certain seasons of the year. In considering the marine fauna the remarkable *palolo* or *balolo* should be mentioned. This annelid propagates its kind by rising to the surface of the sea and dividing itself; but this happens only in certain places, chiefly in the Fijian and Samoan groups, and on just two days in each year, the dates of which can be accurately predicted. As both the annelid and the fish which gather to prey on it are appreciated by the natives as a specially delicate article of food, the occasions of the appearance of the *balolo* are regarded as very important festivals.

For an account of the inhabitants and their social life *see* articles on POLYNESIA, MELANESIA and MICRONESIA, as well as the separate articles on a few larger island groups, *e.g.*, FIJI.

The subsequent sections of this article deal with the island groups in greater detail and in the order in which they have been already mentioned.

ISLANDS OF THE ASIATIC CONTINENTAL EDGE

The *Ogasawara Jima* (Bonin islands) are the subject of a special article.

The *Marianas* (*Mariannes* or *Ladrones*) are situated in about 12° to 21° N. and 145° E. and, with the exception of the island of Guam (the largest of the group) belonging to U.S.A. and the subject of a separate article, are administered under mandate by Japan. They fall into two groups—a northern of ten mainly volcanic islands, of which only four (Agrigan, Anatahan, Alamagan and Pagan) are inhabited, and a southern of five mainly coralline limestone islands (Rota, Guam, Aguijan, Tinian and Saypan), all inhabited save Aguijan. The total area (excluding Guam) is about 245 sq.m.; the Japanese population 1,493 and the natives, mostly descendants of the Tagal immigrants from the Philippines number 3,398. They were discovered by Magellan in 1521 and his crew called them *Islas de los Ladrones* (Islands of the Thieves). They received the name *Las Marianas* in 1668 in honour of Maria Anna of Austria, widow of Philip IV. of Spain. They were sold by Spain to Germany in 1899 and after the war of 1914–18 passed under Japanese mandate.

In the northern volcanic group an extreme elevation of about 2,700 ft. is reached and there are craters showing signs of activity. The southern islands are of slight elevation. The climate is damp and the heat not as intense as in the Philippines. Variations of temperature are not great. All the islands except Farallon de Medinilla and Uraccas or Maug (in the northern group) are more or less densely wooded and the vegetation is tropical and luxuriant, much resembling that of the Carolines and also of the Philippines, whence many species of plants have been introduced. On most of the islands there is a plentiful supply of water. The fauna likewise, is similar to that of the Carolines and certain species are indigenous to both regions. Swine and oxen run wild. The former were known to the early inhabitants while the latter, with most other domestic animals, were introduced by the Spaniards. Coco-nuts and areca palms, yams, sweet potatoes, manioc, coffee, cocoa, sugar, cotton, tobacco and mother-of-pearl are the chief products, and copra is the principal export.

The Island of Yap (lat. 9·35° N., long. 138·15° E) (pop., 8,439) is an important cable station and the subject of a special article.

The Palau (*Pelew*) *islands* are a group of twenty-six islands lying between 2° 35′ and 9° N. and 130° 4′ and 134° 40′ E. under Japanese mandate. The largest islands are Babeltop (Babelthuap, Baobeltaob, etc.), Uruktapi (Urukthopel), Korror, Angaur, Peleliu and Eilmalk (Irakong). The total area is 175 sq.m. and the population is 6,361 (5,754 natives). The islands lie within a coral barrier reef, and in the south the islands are of coral, but in the north of volcanic rock. They are well wooded and the climate is sub-tropical and the water-supply good. A few rats and bats represent the indigenous mammals; birds are numerous and the sea is rich in fish and molluscs. The islands were sighted in 1543 by Ruy Lopez de Villalobos who named them the Arrecifos. The origin of the name Islas Palaos is doubtful. The islands were bought by Germany from Spain in 1899 and administered from Yap. After the World War they passed under Japanese mandate. Further reference is made to Yap and the Palau islands in connection with the Caroline islands below.

THE WESTERN PACIFIC ARCS

First Arc.—The first arc comprises the Louisiade islands, New Caledonia, the Loyalty islands and Norfolk island.

The Louisiade Group form a chain extending south-eastward from the easternmost promontory of New Guinea (*q.v.*) and are included in the Australian territory of Papua (British New Guinea). The islands number over 80 and are interspersed with reefs. They are rich in tropical forest products and gold is obtained on the chief island Tagula or South-east island (area 380 sq m.) and on Misima or St. Aignan. The natives are Papuans. The islands were probably observed by Torres in 1606 but were named by de Bougainville in 1768 after Louis XV.

New Caledonia, a dependency of France, is situated between 20° 1′ and 22° 26′ S., and 164° and 167° 40′ E. Area 6,296 sq.m.; for the islands in the immediate vicinity add 73 sq.m.; while for the dependent islands such as the Loyalty islands, etc., add a further 917 sq.m. Pop. (1926) 51,368, of whom 26,915 were Melanesians and Polynesians, 3,610 introduced labourers from Java and Annam and 2,310 convicts. The total white population, was 17,015. The centres of population are Nouméa, pop. (1925) 27,016, the capital; Bourail, La Foa, Moindu, St. Louis and St. Vincent.

New Caledonia is about 220 miles long with an average breadth of 25–30 m., and lies north-west and south-east. An almost unbroken barrier reef skirts the west shore at about 5 m. distance, enclosing a navigable channel; on the east, which is more abrupt and precipitous, it is much interrupted. To the north the reefs continue, marking the former extension of the land, for about 160 m., ending with the Huon isles. The Isle of Pines, area 58 sq.m., pop. about 600, so called from its araucarias (its native name is Kunie), geologically a continuation of New Caledonia, lies 30 m. from its south-east extremity. It formerly abounded in sandalwood, and consists of a central plateau surrounded by a belt of cultivation. At the two extremities of New Caledonia, parallel longitudinal ranges of mountains enclose valleys; for the rest the island consists essentially of confused masses and ranges of mountains, rising to an extreme elevation of 5,387 ft., the plains being chiefly the deltas of rivers. The landscape is rich and beautiful, varied with grand rock scenery, the coast-line being broken by numerous small bays, into which flow streams rarely navigable even for short distances, but often skilfully used by the natives for irrigation; and sometimes flowing in subterranean channels. The large rivers in the wet season form impassable morasses, especially in the south-east, where the mountains rise in isolated masses from the plains.

The climate of New Caledonia is cooler and healthier than that of the New Hebrides; and its flora and fauna differs considerably, especially, as regards the flora, on the western side, where there is a marked intrusion of Australasian types as against the Polynesian types on the eastern side. The fauna is less different—though there is one very remarkable bird, occurring nowhere else, the wingless *Kagu* (*Rhinochetus jubatus*); deer, though undoubtedly an introduced species, are very abundant.

But perhaps the most remarkable natural feature of the island is the abundance and variety of its minerals; cobalt, nickel (without arsenic) iron and manganese abound, and many others, including gold, are known to exist in varying quantities.

The natives are Melanesians but of mixed blood, including some Polynesian elements.

The island was discovered by Capt. Cook in 1774. He touched at the haven of Balade (the original name of the island) as did d'Entrecasteaux in 1793. The natives were later exploited by traders in sandalwood. French missionaries arrived in 1843. After an incident with the natives in 1851 the island was annexed by France in 1853 although there were further difficulties with a British counter-claim. Nouméa was founded in 1854 when it was called Port de France. In 1860 New Caledonia became a colony distinct from the French possessions in the Pacific at large, and

in 1864 the first penal settlement was made on Nou island, off Nouméa.

New Caledonia is administered for the French Republic by a governor assisted by a privy council consisting of the heads of military, judicial and other services and of two notables of the colony appointed by the President of the Republic. There are also a general secretary and 5 administrators in charge of the arrondissements. There is also an elective general council. The capital Nouméa has a municipality and the other centres are administered by municipal commissions.

There are public and private elementary schools. In 1925 there were 55 public and private primary schools and 74 native schools. The College La Perouse at Nouméa gives some technical instruction in its general curriculum. There are extensive pasture and cultivated lands with some 500 sq.m. of forest. There is a native reserve, ruled in the main by native custom. Coffee, cotton, manioc, copra, maize, tobacco and bananas are among the agricultural products. Cattle and sheep are also important. There are blast furnaces for nickel smelting. A hydro-electric factory was set up in 1926. In 1925 20,715 tons of chrome; 4,400 tons of nickel and 10,000 tons of phosphates were exported. Coffee, cotton, copra and guano are also among the exports. Wine, coal, flour and rice are imported. A narrow gauge railway connects Nouméa to Paita and it is proposed to extend the line to Bourail. There are internal telegraph and telephone communications. The roads are on the whole poor.

New Caledonia has the central government for the Isle of Pines, the Wallis Archipelago, the Loyalty islands, the Huon islands and Futuna and Alofu.

The Loyalty group, a chain of small islands parallel to it, and at a distance of between 50 and 100 miles from the north-east coast of New Caledonia, is composed of three larger islands, Maré, Lifu (Lifou) and Uvéa, and of some islets and rocks, are coral islands of comparatively recent elevation, and nowhere rise more than 250 ft. above sea-level. Maré, the south-east island of the group, has a flat and barren top, between 200 and 300 ft. above the sea, with occasional slopes and terraces, indicative of several successive elevations; but there is an abundant growth of coco-nut palm on the sea-coast. Lifu, the central and largest island of the group (area 650 miles), its greatest length about 33 miles and greatest width about 28 miles, appears from the sea as a succession of plains. Uvéa, the north-westernmost of the three principal Loyalty islands, is a typical coral-atoll carrying on its rim many closely-connected islets and, on its eastern face, carrying the much larger island to which the name Uvéa (or Halgam) island properly belongs. The Loyalty islanders are Melanesians. The group was discovered at the beginning of the 19th century. Christianity was introduced into Maré by native teachers from Rarotonga and Samoa. From 1864 the French have considered the island a dependency of New Caledonia. Coco-nuts are cultivated, while copra and rubber are exported.

Norfolk island lies about 800 m. east of the nearest point of New South Wales, in 29° S., 167° 56′ E. Pop. (1925) 747. It stands on a submarine table-land extending about 18 m. to the north and 25 m. to the south and has itself an area of about 13 sq.m.

The islets of Nepean and Philip lie near it. Its high cliff-bound coast is difficult of access. With a general elevation of 400 ft. above the sea the island rises in the north-west to 1,050 ft. in the double summit of Mount Pitt. The soil, of decomposed basalt, is wonderfully fertile. Oranges, lemons, grapes, passion fruit, figs, pineapples, guavas and other fruits grow abundantly; while potatoes, onions, maize and arrowroot can be cultivated. The Norfolk island pine (*Araucaria excelsa*) is a magnificent tree. The flora is most closely associated with that of New Zealand, and the avifauna indicates the same connection rather than one with Australia. The climate is subtropical, the thermometer rarely sinking below 65°. The island was discovered in 1774 by Capt. Cook, and from 1788 to 1809 and again from 1825 to 1855 was used as a penal settlement in connection with that at New South Wales. In 1856 the descendants of the mutineers of the Bounty were transferred to Norfolk island from Pitcairn. The settlement remained under the authority of New South Wales till 1914, since when the administration has been in the hands of the Commonwealth Government. The imports (mostly from Australia) were valued (1924–25) at £17,190 and the exports at £3,960.

The Second Arc.—The second western Pacific arc comprises the New Britain Archipelago, the Solomon islands, Santa Cruz and the New Hebrides.

The New Britain Archipelago between about 145°–156° E., and the Equator and 8° S., is used here to include both New Ireland and the Admiralty islands which are in line with the Solomon islands and also New Britain which loops between New Ireland and New Guinea. The area of New Britain is 9,500 sq.m.; native population within explored areas (1925) 81,200. New Ireland has an area 3,000 sq.m.; native population (1925) including adjacent islands 38,800. The Admiralty islands have an area of 600 sq.m. All the islands are under Australian mandate. New Britain is crescent shaped and about 300 m. long with a mean breadth of 50 miles. The island is mountainous with several active volcanoes. The highest known peak is the Father (7,500 ft.)—an active volcano. New Ireland lies to the north and is also mountainous. It is separated from New Britain by St. George's channel. There are no active volcanoes. The islands have rich tropical vegetation, and New Britain is well watered by streams. The climate is tropical, considerably tempered by oceanic influences. The islands are not thoroughly explored yet and their coastlines were but imperfectly known until the middle of the 18th century. Jacob Lemaire and William C. Schouten sighted New Ireland in 1616, but it was long thought to be a part of the adjacent islands. In 1884 a German Protectorate was declared over the islands and they were known with many other islets as the Bismarck Archipelago. At the end of the World War they passed from Germany to be held by Australia under a mandate of the League of Nations. The chief town of New Britain and the seat of government is Rabaul; pop. (non-native) 1,350. It is also an anchorage for ships. The old capital was Kokopo, pop. (non-native) 369. Simpson Harbour in Blanche Bay is important. The chief town and seat of local administration in New Ireland is Kavieng (non-natives 356). It is in the extreme north-west of the island, on the north coast of the Nusa harbour. The only other town is Namatanai (non-natives 148).

Missionary societies are at work throughout the region.

New Britain is not much developed save in the Gazelle peninsula in the north. There are four plantations on the north coast and six on the south coast. There are a number of plantations in New Ireland around the coast near Kavieng. The chief industry of the group is coco-nut growing.

The Solomon islands are chiefly elongated islands stretching north-west to south-east, they include Buka (300 sq.m.), Bougainville (3,900 sq.m.), Choiseul (2,260 sq.m.), Malayta (2,400 sq.m.) and San Christoval, with New Georgia and Guadalcanar (2,500 sq.m.) as a subordinate line south-west of Isobel. The total land area is estimated at 17,000 sq.m., while the total population is in excess of 250,000 (1925), of which some 600 are Europeans. Bougainville (1925) had 46,600 native population and Buka (1925) 7,600 native population. There are very numerous outlying small groups. Ongtong Java (native name Leneneuwa) which has also been called 'Lord Howe islands,' is a coral atoll (measuring about 35 miles by 18) which carries a number of low sandy islets; it lies considerably northward of the main group, to which it can hardly be said to belong geographically.

The islands of the main chains are well watered though the streams seem to be small; and the coasts afford some good harbours. All the large and some of the smaller islands appear to be composed of ancient volcanic rock, with an incrustation of coral limestone showing here and there along the coast. The mountains generally fall steeply to the sea, and there is little level land. Deep valleys separate the gently rounded ridges of forest-clad mountains, lofty spurs descend from the interior, and, running down to the sea, terminate in bold rocky headlands, 800 to 1,000 feet in height. The small rocky island of Florida, midway between Guadalcanar and Malayta, is remarkable as being bi-sected by a narrow but navigable channel; it is also remarkable as having much

undulating grass-land interspersed with clumps of trees, between which patches of cultivation give evidence of the richness of the soil. The whole chain of the Solomon islands appears to be rising steadily. Some of the smaller islands are of recent calcareous formation. Barrier and fringing reefs, as well as atolls, occur in the group, but the channels between the islands are dangerous chiefly from the strong currents which set through them.

The climate is damp and debilitating, and the rainfall is unusually heavy. Fever and ague are prevalent on the uncleared parts of the coast; but the highlands, where most exposed to the south-east trade winds are healthier. The dry season, with north-west winds, lasts from December to May. Mangrove swamps are common on the coasts; but of recent years large tracts of these lands have been cleared, by Europeans, for coco-nut cultivation.

The Solomon islanders are of Melanesian (Papuan) stock, though in different parts of the group they vary considerably in their physical characteristics. The history of the Solomon islands is treated in a separate article. The administration is based on the former division of the islands between Germany and Great Britain (convention of 1899). The boundary ran through Bougainville Strait. Since the World War the ex-German territory is administered by mandate under Australia. The British section is administered by a resident commissioner, whose headquarters are at Tulagi, a small island off the south-west of Florida. A nominated advisory council assists in the government. The chief medium of exchange is Commonwealth bank notes. The various missions have charge of education. Coco-nuts, rubber, bananas, pine-apples and sweet potatoes are grown. Copra, trochus shell, ivory nuts and timber are exported mainly from the British Solomons. The value of the imports of the British Solomons 1925–26 was £266,943 and exports £418,818. Kieta on the east coast of Bougainville and Carola Hafen on the west side of Buka are important harbours. The plantations on these islands are, however, new.

The Santa Cruz Islands.—In the British Protectorate of the South Solomons, are a scattered group of small volcanic islands, irregularly disposed from north-west to south-east, between 8° 31′ and 11° 40′ S. and 168° E. to the south-east of San Cristoval, but separated by a deep channel from that island. The following islands are included in the group; the Duff and Matenna or Swallow islands, Analogo, Tinakula or Volcano island and others: from these a single chain curves south-east and then east consisting of Nitendi or Santa Cruz, the largest island, Tupua or Edgecombe, Vanicoro (the scene of the wreck of La Perouse's ships), Tucopia, Anuda (or Cherry) island, and Fataka (area 380 sq.m.; estimated population 5,000).

In Vanicoro there are volcanic mountains up to 3,030 ft. in height, and Tinakula is a still active volcano of 2,200 ft. Nitendi is of less elevation (1,215 ft. at the highest). Coral reefs are not extensive, except around Vanicoro. The islands are densely wooded, the flora and fauna being akin to those of the Solomon islands. The climate is hot and moist, and storms are frequent. The natives are of Melanesian (Papuan) stock, with an admixture of other blood, but the Duff group, Tucopia and Anuda, are inhabited by pure Polynesians. The islands were discovered by Alvaro Mendana in 1595, and in 1767 Philip Carteret visited them and called them the Queen Charlotte islands—their alternative name. A British protectorate was declared over them in 1898. There is some trade in copra.

The New Hebrides, with which may be classed the Banks and Torres islands, continue the chain south-eastward from the Santa Cruz, from which they are separated by a comparatively shallow channel, consist of about 40 mountainous islands besides numerous islets and rocks (*see* Map, Plate 176). Estimated area 5,700 sq.m. with a native population of about 60,000. The islands are under the joint administration of English and French officials. White population (1925) British 232, French 650.

Irregularly disposed at the northern end are the lesser islands composing the Banks group—Gaua, Vanua Lava, Mota, Valua, etc., and the Torres islands. South from these, the main islands are arranged somewhat in the form of the letter Y, the foot of which is at Aneiteum, the south-easternmost Hebridean island, north-west from which the main islands are Tanna, Eromanga, Efaté (known also as Vaté, Faté, and Sandwich island), the Shepherd Islands and Api or Epi. At this point the arms of the Y divide, the western formed by the large islands of Malekula (or Mallicolo) and Espiritu Santo (abbreviated to Santo; native name Marina), the eastern formed by Ambrym, Arag and Maiwo (Aurora), with Aoba (Opa, or Leper island) between the two arms. Espiritu Santo, the largest island, has an area of 875 sq.m.; at its north-east side is the great bay of St. Philip and St. James—locally called "Big Bay"—first seen by the Portuguese Quiros, in 1606, when he thought he had found the shore of a great southern continent, which he named Australia del Espiritu Santo.

Efaté, situated almost at the dividing point of the two arms of the Y, is one of the most important of the New Hebrides, having two excellent harbours, Vila and Havannah, within the first named of which is the seat of the Anglo-French administration. Britain is represented by a high commissioner who delegates his power to a resident commissioner. On the island of Mallicolo (Malekula) is Port Sandwich, the chief port of the New Hebrides after Vila.

With their rugged outline and rich vegetation, the New Hebrides islands as seen from the sea are very beautiful. Excepting the small Torres group, which are low-lying and perched on reefs, but without lagoons, all the islands are of volcanic, not coral formation, the larger ones lying on both sides of the line of volcanic activity. The coasts are almost free from reefs and the shores rise abruptly from deep waters. Old coral is sometimes found elevated to a considerable height. The islands are formed chiefly of basalt and recently erupted material; earthquakes and submarine eruption are not infrequent; and several of the islands have very active craters. All have considerable elevations, one of the loftiest being the isolated cone of Lopevi, near the junction of the arms of the Y; its height is 4,714 ft.; in Espiritu Santo a height of 6,169 feet has been recorded. The volcanic soil is very rich. Numerous clear streams water the islands, but some debouch upon flat ground towards the sea, and then form unhealthy marshes. Copper, iron and nickel are the most important minerals known in the group; and sulphur is of some commercial importance.

The climate is generally hot and damp, especially during the months from November to April. The natural vegetation is especially luxuriant and interesting. The coco-nut palm, elsewhere confined to the parts little above the sea-level, has here spread up on to the hill-sides. The sandalwood tree occurs; and it is noteworthy that when the sandalwood traders had exhausted the supply of their commodity in the Fijian islands (1804–1816), it was chiefly to the southern New Hebridean islands that this trade was diverted. The indigenous fauna is even less abundant than in the Solomon islands; as has been said, it is possible, even probable, that the pigs so treasured by the natives had spread into the New Hebrides from Papua before the first coming of Europeans, but otherwise the only mammals are bats and rats. European pigs and horned cattle have, however, run wild in certain parts. Birds, insects, and fish are abundant. The natives are Melanesians of mixed blood, though in places a few Polynesians have succeeded in establishing themselves.

The history of the New Hebrides is treated in a separate article. There are numerous missions at work among the natives. Presbyterian and Catholic missions have native schools. There are in addition one French government school and two Catholic mission schools for the white population. Large areas of the land have been cleared and well cultivated—chiefly by French and British; and there is a considerable export of copra, coffee, maize, cocoa, cotton and bananas, and even of European vegetables and fruits.

Imports include provisions and foodstuffs, clothing, furniture and metal work. There is a small saw-mill on Efaté. The imports for 1925 were, British, 6,107,509 francs; French, 15,896,723 francs; and the total exports amounted to 31,115,143 francs, of which three-quarters was French. The trade is mostly with Australia, New Caledonia and France.

So far as concerns the movement of peoples in this region the continuation of the line from north-west to south-east repre-

sented by the Solomon and the New Hebridean islands, along which the Melanesians doubtless passed down into the Pacific is to be found in the Fijian group where the Melanesians confronted the Polynesians of the Tongan (Friendly) islands. It has been found advisable, however, in this article, to treat the island chains in the order of their supposed structural relations.

The Third Arc.—The third western Pacific arc comprises the Caroline islands, the Marshall islands, the Gilbert islands with Nauru and Ocean islands, the Ellice islands, Rotumah and the Fijian archipelago.

The Caroline islands are a widely scattered archipelago under Japanese mandate, included in Micronesia, and lying between 5° and 10° N. and 135° and 165° E. Geographically they fall into a series of sub-parallel lines while administratively the islands are divided into two groups—the Eastern Carolines, with Truk and Ponape as centres, and the Western Carolines, together with the Palau (Pelew) islands and Yap island which belong to the continental border (*v.sup.*). The total land area is about 380 sq.m. and of this 307 sq.m. is covered by the four main islands, Ponape, Kusaie, Truk (or Hogolu), and Yap. The total population of the Carolines is estimated at 36,000. Truk has 598 Japanese, 5 foreigners, and 14,788 natives; Ponape, 425 Japanese, 6 foreigners and 6,638 natives; Palau (Pelew), 592 Japanese, 15 foreigners, 5,754 natives; Yap, 97 Japanese, 4 foreigners, 8,338 natives. The islands were made known to Europeans by the Portuguese Diego da Rocha in 1527 and were called by him the Sequeira islands. In 1686 Admiral Francesco Lazeano renamed them the Carolines in honour of Charles II. of Spain. Spain definitely claimed the group in 1875 but this was contested by Germany. After arbitration the islands passed to Spain with free trading rights for Germany. In 1899 Germany finally bought the islands from Spain and held them until after the World War when they passed under Japanese mandate.

The main islands are of considerable elevation. The highest point of Ponape reaching some 3,000 ft. The remaining islands of the group are generally low coral islets. The climate is equable and moist, but the islands are subject to severe storms. The vegetation is tropical and luxuriant, much resembling that of the neighbouring island groups particularly the Marianas. The fauna is likewise similar to that of the Marianas group. The natives are careful agriculturists and clever navigators. Copra is the chief export.

The *Marshall* group consists of a number of atolls ranged in two almost parallel lines which run from north-west to south-east between 4° and 15° N. and 161° and 174° E. The north-east line, with fifteen islands, is called Radak, and the other, numbering eighteen, Ralik. The islands are under Japanese mandate. Area (estimated) 160 sq.m. with a population of 198 Japanese, 13 foreigners and 9,589 natives. The most populous island is Majeru. The islands were probably visited by de Saavedra in 1529, Capt. Wallis touched the group in 1767, and in 1788 Captains Marshall and Gilbert explored it. They were annexed by Germany in 1885–1886 and passed under Japanese mandate after the World War. The atolls rise but little above high water mark. The highest elevation occurs on the island of Likiep but is only 33 feet. The lagoon is scarcely more than 150 feet deep and is accessible through numerous breaks in the reef. The reef scarcely exceeds 600 ft. in width. The surface of the atolls is covered with sand except in a few places where by admixture of decayed vegetation it has been turned into soil. The climate is moist and hot, the mean temperature being 80·5°. Easterly winds prevail throughout the year. There is little change of seasons the highest temperature being in January and the lowest in July. Vegetation, on the whole, is very poor. There are many coco-nut palms, bread-fruit trees (*Artocarpus incisa*), various kinds of bananas, yams and taro, and pandanus, of which the natives eat the seeds. From the bark of another plant they manufacture mats. There are few animals. Cattle do not thrive and even poultry are scarce. Pigs, cats, dogs and rats have been imported. There are a few pigeons and aquatic birds, butterflies and beetles. Crustacea and fish abound on the reefs.

The chief island and administrative centre is Jaluit. Protestant (American) and Roman Catholic missions maintain coloured teachers on many of the islands. The chief products for export are copra, tortoise-shell, mother-of-pearl, sharks' fins and trepang. The plantations of coco-palm amount to 1,275 hectares.

The Gilbert islands, or as these are sometimes called, the Kingsmill islands, a chain of coral atolls, carrying some 16 small and low islands, begin slightly north of the Equator and only a little west of the 180 meridian line. Area 166 sq.m. Pop. (1926) 23,250 of which 264 were Europeans (1921). The soil, mostly of coral sand, seems originally to have produced little other vegetation than coconut palms, "screw-pines" (Pandanus), and perhaps a few bread-fruit trees; but, by digging pits to catch the rain water, a giant form of tannia has been introduced by the natives. These few plants—together with the very rich produce of the sea—must have sufficed to support a very dense population of Polynesians. The islands were discovered by John Byron in 1765, Capts. Gilbert and Marshall visited them in 1788. The dense native population of these islands led to the introduction of many of their number to Hawaii as labourers in 1878–1884, but the experiment was unsatisfactory. The islands were claimed as Protectorates by Britain in 1892 and annexed as part of the Gilbert and Ellice Islands Colony in 1915. British and American missions are at work.

Some 200 m. west of the Gilbert islands and a little south of the Equator, are the two remarkable islands of Ocean island (native name Banaba), six miles in circumference (pop. [1926] 2,062 [126 European, 471 Chinese besides Pacific islanders]); and *Nauru* (Pleasant island), area 5,936 acres (pop. [1926] 2,217 [117 Europeans and 822 Chinese besides Pacific islanders]), both notable for their rich phosphate deposits. Unlike the Gilbert islands proper, these islands have been elevated, probably by volcanic action, much above sea-level—the highest part in each being about 260 feet. Even this elevation has allowed a rather more varied natural vegetation than in the Gilbert islands; the natural conditions have however been much altered.

The phosphate deposits were discovered in 1900, and were developed by the Pacific Phosphate Co., until 1919 when the interests of the company were bought by the British, Australian and New Zealand governments.

Ocean Island was annexed by Britain in 1901 and is the headquarters of the Gilbert and Ellice islands Colony. Nauru was annexed by Germany in 1888, but passed by mandate of the League of Nations to Britain after the World War. Great Britain, Australia and New Zealand agreed (1919) that Australia should appoint the first administrator for a term of five years. There is compulsory education for Europeans and natives to the age of 16, after that age technical training is given.

Ocean island and Nauru have important wireless stations.

The Ellice (Lagoon) islands, area 14 sq.m. Pop. (1925) 3,530, like the Gilbert islands, all coral atolls, nowhere raised more than a few feet above the sea-level, and where so raised densely clad with coco-nut palms, comprise a large number of low coralline islets clustered on some nine atolls, spread over a distance of about 400 m. in the direction from north-west to south-east. The chief groups, all yielding coco-nuts, pandanus-fruit and taro, are Funafuti (Ellice island), Mukulailai, Murakita, Nukufetau, and Nanomana. Like the Gilbert islanders, the natives are Polynesians exhibiting traces of Samoan origin. Nearly all the natives are nominally Christians. These islands together with the Gilbert islands were proclaimed Protectorates in 1892 and annexed within the Gilbert and Ellice islands Colony in 1915. This Colony is administered by the high commissioner through a resident commissioner whose headquarters are at Ocean island.

Rotuma, area, 14 sq.m. and population about 2,200, the principal of a cluster of small islands lying some 220 m. north-north-west of the northernmost Fijian reef, is of volcanic formation, though activity has so long been extinct as not to be recorded even in tradition; there is much coral-growth about the main island—as indeed about the adjacent islands. The island was discovered by Capt. Edwards of the "Pandora" in 1791. The island is high and rugged, clothed on the higher parts with luxuriant vegetation and on the coast with many coco-nut palms. There are

no visible streams, though the rainfall is considerable: the water apparently sinks through the loose soil and boulders which cover the whole island, and runs underground to the sea. The natives differ in language and in many other aspects from the Fijians. Always a vigorous and enterprising people, with a special reputation for peacefulness and hospitality to the occasional visitors who reached their shores, they have, since being taken at their own request under British protection (1881), become perhaps one of the most satisfactorily civilized peoples of their kind.

The natives are mostly either Wesleyans or Roman Catholics. A European commissioner resides, who, together with the native chiefs and two native magistrates, forms a regulation board which draws up the local laws subject to the approval of the legislative council of Fiji. The chief product is copra.

The Fijian Archipelago (*see* Map, Plate 51) in many respects the most important in the Pacific, lies east-north-east and at a distance of about 730 miles from New Caledonia, between 15° and 20° S., and on and about the meridian of 180°. It consists of about 250 islands, of which some 80 are inhabited, with a total land area of about 7,050 sq m. (thus roughly equalling that of Wales). The islands are ranged more or less in the form of a horse-shoe, open to the south, and more or less enclosing the Koro Sea. The largest island is Viti Levu, which with the long and narrow island of Kandavu, forms the western leg of the horse-shoe; it is 95 m. in length (east to west) and 67 in extreme breadth, with an area of 4,053 sq.m. Forty miles north-east, at the central point of the horse-shoe, lies Vanua Levu, measuring 117 m. by 30, with an area of 2,130 sq m. Close off the south-east extremity of Vanua Levu is Taveuni, 26 m. in length by 10 in breadth; and from the eastern side of Taveuni a chain of comparatively small islands, known as the Lau or Eastern Group, runs down nearly to 20° S., thus forming the eastern leg of the horse-shoe. Three other islands, all within the Koro Sea, must be mentioned: Ovalau, Koro and Ngau (Gau).

The Fijian islands are mostly extinct volcanic elevations (some up to about 4,000 ft.) which with very few exceptions are surrounded by fringing reefs; but, especially on the eastern side of the group, there are many coral atolls with or without openings into central lagoons.

The surface of the high islands is very rugged, the vegetation is luxuriant, and the general appearance very beautiful. There is not much level country, except for certain rich tracts along the coasts of the two large islands (Viti Levu and Vanua Levu), especially near the mouths of the rivers, and these larger islands have a considerable extent of dry and open undulating country on their lee sides. Streams and rivers are abundant, the latter very large in proportion to the size of the islands, affording a water way to the rich districts along their banks. These and the extensive mud flats and deltas at their mouths are often flooded, their fertility is thus increased, though at a heavy cost to the cultivator. The Rewa river, debouching through a wide delta at the south-east of Viti Levu, is navigable for small vessels for 40 m.; also in this island there are the Navua and Singatoka rivers (flowing south), and the Nandi (west), and the Ba (north-west). The chief stream of Vanua Levu is the Dreketi, flowing west, breaking through the mountains in a fine valley; for this island practically consists of one long range, whereas in Viti Levu the main valleys and separating ranges radiate for the most part from a common centre. Viti Levu is the most important island not only from its size, but from its fertility, variety of surface, and population, which is over one-third of that of the whole group. At Suva, the capital of the Colony of Fiji, there is a very good harbour. Vanua Levu is less fertile; it has good anchorages along its entire southern coast. Of the other high islands, Taveuni, remarkable for a lake (presumably a crater-lake) at the top of its lofty central ridge, is fertile, but exceptionally devoid of harbours; whereas the well-timbered island of Kandavu has an excellent one, Ngaloa, on its southern side. On the island of Ovalau, an island which contains in a small area a remarkable series of gorge-like valleys between commanding hills, is the town of Levuka, the capital until 1882. The chief islands scattered about the western side of the Koro Sea (Koro, Ngau, Moala and Totoya), are all productive, elevated and picturesque, and afford good anchorage.

The islands of the chain limiting the Koro Sea on the east are smaller and more numerous. At the north of the chain are the Exploring isles, a somewhat scattered group surrounded by a barrier reef, 77 m. in circuit; on the western side of which is Vanua Mbalavu (14 m. long and from ½ to 2½ m. broad) with several peaks, the highest of which rises to 930 ft.; it is a centre of native trade. Farther south in the chain, and somewhat to the east, is Mango (3 m. in diameter, and almost surrounded by a reef half a mile broad), remarkable for a subterranean outlet of the waters from the fertile valley in its midst. Farther south again is Lakemba, a rounded, volcanic island, from 4 to 5½ m. in diameter, its highest point rising to 720 ft., and surrounded by a fringe of coral extending from 2 to 10 cables from the shore. It also is an important centre of native trade. Farther south is a welter of small volcanic coral-reef surrounded islands, ending at Vatoa (lat 19° 49′ S., long. 175° 13′ W.), the only Fijian island visited by Capt. Cook—and by him named Turtle island.

The Fiji islands lie beyond the limits of the perpetual south-east trade wind, while not within the range of the north-west monsoons. From April to November the winds are steady between south-east and east-north-east, and the climate is cool and dry, after which the weather becomes uncertain and the winds often northerly, this being the wet, warm season. From November to March heavy gales are frequent, and hurricanes sometimes occur between these months—though, curiously enough, very rarely in February. The rainfall is much greater on the windward than on the lee sides of the islands (about 110 in. in Suva); the mean temperature is much the same, viz., about 80° F.; in the hills the temperature sometimes falls below 50°. The climate, especially from November to April, is somewhat enervating to the Europeans, but not unhealthy. Malaria is hardly known; but severe epidemics of dengue fever and of influenza sometimes occur. Dysentery, which is common, and the most serious disease in these islands, is said to have been unknown before the incoming of Europeans.

The flora is mostly of a tropical Indo-Malayan character—thick jungle with great trees swathed with creepers and epiphytes, but, especially on the western side, there is some intermixture of Australian and New Zealand types. On the lee side of the larger islands, however, the tree growth is often replaced by grassy plains, suitable for grazing, with trees (chiefly Pandanus) few and scattered in more open parts but more thickly clustered in the stream gullies. On the coastlands of the larger high island the coco-nut palm is ubiquitous in the drier parts, but is replaced in the damper parts by the mangrove. Many of these mangrove swamps have, however, been laboriously reclaimed, and now carry flourishing crops of sugar cane. At an elevation of about 2,000 ft. the vegetation changes to a more montane type, and at still higher elevation takes on the appearance of inter-tropical rain forest in the more densely tree-covered areas, while the drier and more open mountain-slopes are clothed in a dense growth of tall reeds. Many of the indigenous trees are of value, *e.g.*, the vesi (*Afzelia bijuga*) and the ndilo (*Calophyllum Inophyllum*) for their timber, the last named also for the oil obtained from its seeds which is much used in the islands, as in India, in the treatment of rheumatism; the dakua (*Dammara Vitiensis*), a pine-tree allied to the New Zealand Kauri, provides a valuable resin resembling the Kaurigum. The yasi or sandalwood (*Santalu, yasi*, Seemann) formerly abundant on the north-west side of Vanua Levu was all but exterminated as a consequence of the too-busy trade carried on in this very valuable commodity between 1804 and 1816; in recent years this tree has been strictly protected by law, but though discovered in other parts of the Fiji neither in these nor in the original locality has it since again become abundant. It was mainly this mad rush for sandalwood which led to the earliest settlement of white men in the Fiji islands.

The fauna is very little different from that of the other comparable south sea islands. Indigenous mammals except bats, and possibly rats, though even these are probably no longer represented by an indigenous species, are non-existent; birds, especially pigeons, doves and parrots, are, or were, fairly numerous; fish of many kinds are plentiful, and, together with vegetables, form the

chief food of the natives; insects are not conspicuously abundant. It has already been told that the remarkable phenomenon of the periodical rise of the annelid known as *balolo* is mainly observable in Fiji.

The natives are undoubtedly of Melanesian stock, but more specialized than the other folk of the same original stock who entered the Pacific by way of the Solomon islands and the New Hebrides; moreover there has been—though probably only in comparatively recent times—some intermixture of Polynesians from the Tonga or Friendly islands, especially in the Eastern or Lau group, and to a less extent in certain districts of both Viti Levu and Vanua Levu. The sea channel, some 200 miles wide, which separates the Fijian from the Tongan group served as a barrier between Melanesia and Polynesia where the two most nearly approached each other. The population in 1921 was 157,266, estimate (1926) 171,644, and the indigenous people (*see* MELANESIA) now form slightly more than half the total, the principal other element being Indian coolies. Among the immigrant elements, who are largely labourers, it is natural that there should be an excess of men, but this excess occurs also among the native folk; it is held by many students that such an excess in an indigenous people is usually a sign of the decline of the race concerned. The transition from traditional to Europeanized life is a most complex one involving myriad crises of adjustment, many unforeseen and almost unforeseeable, and there is besides a heavy toll to be paid by way of deaths from infectious diseases which may not do great harm in Europe but mow down peoples which have not acquired immunity. It is said that the intermingling of indigenous and Indian elements is slight.

For an account of the history of Fiji *see* separate article.

The archipelago is governed under the secretary of State for the British colonies by a governor who is helped by an executive of six members. There is also a legislative council of twelve nominated members (including one Indian), seven members elected by persons of European descent, and two nominated Fijians. There are seventeen provinces under native chiefs advised in some cases by European commissioners. The Wesleyan Methodist Church claims a very large number of members among the native population but there are some Roman Catholics. The Indian element is Mohammedan or Hindu. There are numerous mission schools and government schools. The chief activity is agricultural and the crops grown for export are chiefly copra, sugar and bananas but rice, maize, rubber, tobacco, beans, etc., are also grown, and shells are an object of export trade. There are several sugar mills, copradying establishments and sawmills. Fiji imports manufactured goods, flour, fuel, manures, timber and some of the meat it needs though cattle are kept in fair numbers.

Maritime communications are naturally of special importance in an archipelago but there is a small gauge railway, 120 m. long, from Tavua to Singatoka and motor roads and bridle paths are in use. There is telegraphic and telephonic communication and now also stations for wireless telegraphy. Cables go to Canada, Australia and New Zealand, and steamship communications are chiefly with Vancouver, Sydney and Auckland. The 1925 trade figures were imports, £1,271,135, exports, £2,156,257. The tonnage entered and cleared in 1924 was 799,214, a very large proportion being British. Money weights and measures are all as in the United Kingdom.

The Fourth Arc.—The fourth western Pacific arc comprises the Kermadec islands and the Tonga group.

The Kermadec islands lie about 30° S., and 178° W., and about 600 m. north-north-east of New Zealand. The total area is about 15 sq.m. The largest island of the group is Raoul or Sunday island, 20 m. in circumference and 1,600 ft. high and thickly wooded. Macaulay island is 3 m. in circuit. The flora and fauna are related to those of New Zealand. The islands were named from D'Entrecasteaux's Captain, Huon Kermadec, in 1791. They were annexed by New Zealand in 1887, and are now uninhabited.

The Tongan Archipelago, or as Captain Cook named them "the Friendly islands," consists of at least 100 islands and islets, between parallels 15° and 23½° S., and meridian 173° and 177° W. These islands, lying south-east from the Fijian group, resemble irregularly scattered links of a broken chain, the main axis of which extends for some 175 m. This chain is divisible into three main groups, the Vavau islands the northernmost, the Haapai islands, and the Tongatabu group—with which may be included Eua—the southernmost. The total area of the group is about 385 sq.m. Pop. (1921) 23,759 Tongans, 370 Pacific islanders, 571 Europeans and 235 half-castes.

It was the island of Tongatabu, discovered by Tasman in 1643 and by him named Amsterdam island, which at the beginning of the 19th century became the starting-off point from which the sandalwood traders reached the then still hardly known Fijian islands, a fact to which it is due that the name Tonga (the first syllables of Tongatabu) has passed into use for the whole archipelago—for which the natives themselves seem to have had no one name. (For history of Tonga, *see* separate article.)

Even the main islands of the groups, Tongatabu and Vavau, are small, the former measuring about 25 m. by 10 and nowhere rising to a height of more than 60 ft., and Vavau measuring some 9 m. in length and 6½ in breadth. Vavau, however, has cliffs rising to 600 ft. on its northern sides.

Coral, present throughout the group, is more especially so in some of the smaller islands of the chain, *e.g.,* in the Haapai group; but even here volcanic formation is still very evident, and in some cases still active; Tofua, rising to 2,846 ft., Late, 1,800 ft., and Kao, 3,020 ft. are still active cones.

Most of the Tonga islands, however, are level, averaging 40 ft. high and rising to 600 ft.; their sides are generally steep. The surface is covered with a rich mould unusual in coral islands, mixed towards the sea with sand, and having a substratum of red or blue clay. The soil is thus very productive, although water is scarce and bad. Barrier reefs are rare; fringing reefs are numerous, except on the east side, which is nearly free, and there are many small isolated reefs and volcanic banks among the islands. If the reefs impede navigation, they form some good harbours; the best of these harbours is that of Vavau, the only defect of which is that the entrance is somewhat narrow and tortuous. Fairly good harbourage is also to be found off the north of Tongatabu.

The climate is dry and cool compared with that of Samoa and Fiji. There are frequent alterations of temperature, which averages 75° to 77°, though considerably higher in the wet season. Cool south-east trade winds blow, sometimes with great violence, from April to December. During the rest of the year the winds are from north-west and north, with occasional hurricanes. The average rainfall for the year is about 80 inches. The vegetation is somewhat similar to that of Fiji, but less luxuriant; it was the absence in the Tonga islands of timber trees large enough for the necessary boat-building that led to expeditions by the Polynesian Tongan folk to the distant and almost unknown islands where dwelt the fierce Melanesians of "Viti." Ferns, mosses, orchids, aroids and other plants of moist tropical forests are naturally, also much less abundant in the Tongan than in the Fijian islands. As a consequence of these conditions, the landscape in the Tongan islands is less beautiful than that seen either in the Fijian group to the west or in the Samoan group in the east.

The only indigenous land mammals are a small rat and a large fruit-eating bat, which last named occurs in extraordinary numbers. Birds of prey are very few, but other genera of avifauna are fairly numerous. There are snakes and a few lizards but no frogs or toads. The marine fauna is, as usual in the islands, much more abundantly represented.

Northward and eastward from Vavau are the two very isolated volcanic islands of Niuatombutombu (or Keppel island) and Tafahi (or Boscawen island) which, politically at least, are reckoned as part of the Friendly group. Both, despite their inaccessibility, are inhabited by natives and now by a few Europeans, and from both trade is done in copra derived from the very numerous coco-nut palms.

The islands became a British protectorate under native rule in 1900, and in 1905 the financial administration came under British control. The native sovereign is assisted by a legislative assembly which meets annually. It has 21 members, seven nobles, seven representatives of the people (elected) and the seven minis-

ters of the Crown. The elections are held every three years. The capital of the group is Nukualofa. The natives are Christians and the Wesleyan Free Church of Tonga, the Free Church, and the Roman Catholics claim the majority of the inhabitants. The natives have free education and medical attendance. There were 105 public primary schools in 1924. There is also a Tonga College (161 students in 1924).

Copra is the chief export (13,758 tons in 1925). Imports include flour, timber, sugar, meats, drapery, hardware, foods, etc., while a certain amount of live-stock figures among the exports. Most of the trade is with Britain, Australia, America and New Zealand. There is a wireless station at Nukualofa and a substation at Vavau.

THE ISLAND GROUPS CUTTING THE HAWAII–NEW ZEALAND DEEP

These islands fall into four groups, the Samoan archipelago, the Wallis archipelago and the Tokelau and Phoenix groups.

The Samoan Archipelago, an insular series of much importance, is a chain of many island-groups, the five principal of which, are from west to east, Savaii (area 660 sq.m.); Upolu (area about 575 sq.m.), under New Zealand mandate; and Tutuila (40·2 sq.m.) Manua and Rose I. the property of the United States of America, all lying between lats. 13° 30′–14° 35′ S. and longs. 168° 00′ and 173° W. Pop. New Zealand mandated Samoa (1925) 36,308 natives, 2,498 European and half-castes, Chinese 888, others 535. Total 40,229. American Samoa total area 60 sq.m. Pop. (1926) 8,763. All the main islands except Rose island, which is a coral atoll carrying two islets (uninhabited), are high volcanic islands surrounded by many coral reefs. Volcanic activity though generally quiescent is still liable to outbursts, as for instance in Savaii in 1905 when the lava flowing from a cone in the centre of the island devastated much of the previously fertile soil.

The group is well-watered and the igneous soil generally very fertile, with the result that the vegetation is luxuriant, and the scenery in the valleys running down from the mountains to the sea is very beautiful.

There are fairly good reef-protected harbours at Saluafata and at Apia (both on the N. side of Upolu Island), though it was at Apia, in the hurricane season of March 1889, that a famous tidal-wave destroyed most of the shipping which happened to be lying within the harbour. But the one really good harbour in the group is that at Pango Pango, on the south side of Tutuila—which island, with all others to the east of it, is United States owned.

Climate, Flora and Fauna.—The climate, though moist and sometimes oppressively hot, is pleasant on the whole. The fine season lasts from April to September, the wet from October to March. The temperature is equable—at Apia the mean annual temperature is 78° F, the warmest month being December (80°) and the coldest July (75°–76°). The prevalent winds are south-east trades, but west winds supervene from January to March

The Samoan forests are remarkable for the size and variety of their trees—hardwood trees, useful for boat-building, being especially characteristic of Savaii. The luxuriance and beauty of ferns, creepers and epiphytes is very notable.

Of the very limited land fauna of Samoa, consisting mainly of a rat, a few snakes, and a few birds, the most interesting member of which is a ground pigeon (*Didunculus strigirostris*), which forms a link between the extinct Dodo and the extant African Treroninae. The marine fauna is as abundant and varied as elsewhere in the tropical South Seas.

The Samoans are Polynesians of the purest breed; they indeed dispute with the Hawaiians a claim to be the original Polynesian stock.

The history of Samoa is dealt with in a separate article.

The ex-German Territory of Western Samoa is now (1929) administered by New Zealand under a mandate of the League of Nations, while Eastern Samoa (Tutuila, Manua, etc.) is in the possession of the United States. Administration etc. in this territory is discussed elsewhere.

In Western Samoa there is a legislative council of not less than six official members. Unofficial members must not exceed in number the official members. Three unofficial members are elected members. The administrator is entitled to preside over every meeting of the council. There is a native council which advises the administrator in native affairs. There are four Government schools and also schools conducted by various missions. There are over 11,000 scholars. The inhabitants of the islands profess Christianity (Protestants, Catholics and Mormons). Coco-nut, cacao and bananas are the principal products and copra is the chief article of export. The cultivation of cotton and rubber-tapping has been recommenced (1918–28). In 1925–26 the revenue was £150,038, and the expenditure £145,688. The revenue is augmented by an annual subsidy from New Zealand.

There are high-power wireless stations at Apia (belonging to New Zealand) and on the island of Tutuila (belonging to U.S.A.).

The Wallis Archipelago (Uvea or Uea) is a group situated about 13° S. 176° W. with a land area of 40 sq.m. pop. about 4,500 belonging to France. The principal islands are Uvea, of volcanic formation and surrounded with coral, and Nukuatea. The inhabitants are Polynesians. The islands were discovered by Samuel Wallis in 1767 and came under French missionary influence in 1837 and were subsequently annexed coming under New Caledonia for administrative purposes in 1888. There is a French resident. The trade of the islands is mainly with Samoa, whence cottons and iron goods are imported, and to which copra and roots are exported.

The Horne islands (Futuna and Alofi), south of the Wallis group with about 1,500 inhabitants were discovered by J. Lemaire and W. C. Schouten in 1616 and placed under the French protectorate in 1888. They are administered from New Caledonia.

The Tokelau (*Union Group*), east from the southernmost of the Ellice group, and about 350 m. north-east of Samoa, consists of three atolls, Atafu, Nukunau, and Fakaafo, each of which carries many islets. Little but copra is produced from these.

The area of the group is 7 sq.m. and population (1921) 989. The natives are all Christians and akin in type to the Samoans. These islands were formerly administered as part of the Gilbert and Ellice Is. Colony but were transferred (1926) to the jurisdiction of New Zealand, and are administered by the administrator of Western Samoa.

The Phoenix islands are a group between 2° 30′ and 4° 30′ S. and 171° and 174° 30′ W. They comprise eight small coral islands. Total area of the group 16 sq.m. Pop. 59. With the exception of Sydney and Hull islands they have little vegetation. A considerable amount of guano has been obtained from these islets, but this has now been exhausted. The islands were annexed by Great Britain in 1889–1892.

THE EASTERN POLYNESIAN CHAINS

The first chain. The first eastern Polynesian chain may be taken to include the island of Niue (Savage I) the Cook (Hervey) Is. and Austral (Tubuai) Is.

Niue (*Savage island*) 40 m. in circumference; pop. (1926) 3,795, eastward from the Friendly group, and nearer to that than to any of the other groups, is a dependency of New Zealand since 1900. The whole island (in 19° 10′ S., 169° 47′ W.) is an old coral reef upheaved 200 ft., honey-combed with caves and seamed with fissures, through which the abundant rainfall drains into caverns having communication with the sea. The natives (all Christians) are of mixed Polynesian and Melanesian race, are certainly less cultured than the Tongans or the Samoans, are industrious and friendly, and certainly do not seem to deserve to be regarded as especially "savage."

Niue is administered under the Cook islands and there is a New Zealand resident commissioner stationed on the island. A little copra and fungus is exported.

The Cook (*or Hervey*) *islands* lie between 155° and 160° E. and about 20° S. The group comprises partly volcanic, partly coralline islands the most important of which is Rarotonga, 20 m. in circumference (pop. [1926] 3,906). This island has several cones 300 to 400 ft. high above which towers the Rarotonga vol-

cano (2,920 ft.). The land is fertile and well watered. The other important islands are Mangaia (Mangia) (pop. [1926] 1,249) and Aitutaki, 21 m. in circumference (pop. [1926] 1,431). These islands have luxuriant coco-nut palm groves. The island of Atiu has 933 inhabitants, Mitiero 238, and Mauki (Parry Island) 511. The total land area is about 111 sq.m. The climate is tempered by oceanic influences, but the reefs make the islands difficult of access. The natives are Polynesians possessing legends of their emigration from Samoa. The group was discovered by Captain Cook in 1777. Missionary work has been in progress since 1823, the population being almost entirely Protestant. Since 1890 laws for the islands have been drawn up by a general legislature and administered by an executive council of which *Arikis,* or native chiefs, are members. At Rarotonga there is a New Zealand resident commissioner who has a veto over all laws. In 1915 New Zealand included a minister of the Cook islands, charged with their administration as a member of its own executive council. The new act provided also for the constitution of island councils, courts of justice, and the establishment of public schools.

The chief products of the Cook islands are bananas, oranges, tomatoes, coco-nuts, copra, shells and hats. A wireless station is established at Rarotonga, with other stations at Atiu, Niue, Aitutaki, and Mangaia.

The *Tubuai or Austral is.*, belonging to France are situated between 21° 49′ and 27° 41′ S., and 144° 22′ and 154° 51′ W. The total land area is about 110 sq.m. and about 2,955 inhabitants. They are a scattered group of five principal islands surrounded by fringing coral-reefs, the islet-bearing coral atoll known as Hull or Maria island, and, of more importance, four islands forming a curved broken chain from N.W. to S.E., namely Rimitara, Rurutu, Tubai (area 40 sq.m.), Vavitao, and, at a distance of 380 m. from Tubuai, Rapa or Oparo islands. Tubuai, Vavitao, and Rapa are volcanic and reach considerable elevations (2,077 ft. in Rapa). The islands are well watered and fertile. The natives are Polynesians and were once much more numerous than they now are. Captain Cook visited Rurutu in 1769 and Tubuai in 1777. Rapa was discovered by Vancouver in 1791 and Vavitao at different times. The French protection and subsequent annexation was carried out spasmodically between the middle of the 19th century and 1889. The islands are politically dependent on Tahiti.

The second chain includes the Society islands. The Society archipelago, now commonly called Tahiti, is another group of high volcanic islands—with a few coral atolls—lying between 16° and 18° S., 148° and 155° W. with a total area of 657 sq.m. belonging to France. The "Society islands" is a double group, separated by a clear channel of 60 m. in breadth; the north-west or Leeward group including the islands of Huaheine, Raiatea and others, and the south-east or Windward group containing the famous island of Tahiti (600 sq.m.). Pop. (1924) 7,145—on which is Papeete (pop. [1924] 4,601, of whom 2,126 are French) the capital of the French possessions in those parts—and a few small islands.

The island of Moorea (50 sq.m.), pop. (1924) 1,927, is important.

The island of Tahiti itself, in shape not unlike the figure 8, has a length of 33 m., a coast-line of 120 m., and an area of 402 sq.m. It is divided into two portions by a short isthmus (Taravo) about a mile in width, and nowhere more than 50 ft above sea-level. The southern, the peninsula of Taiarapu, or Tahiti-iti (Little Tahiti), measures 11 m. in length by 6 m. in breadth, while the northern, the circular main island of Porionuu, or Tahiti-uni (Great Tahiti), has a length of 22 m. and a breadth of 20. The whole island is mountainous. A little to the north-west of Great Tahiti the double peak of Orohena rises to 7,321 ft. and the neighbouring Aorai is but little lower. Little Tahiti has no such elevation, but its tower-like peaks are very striking. The flat lands of the Tahitian coast, several miles wide—with its chain of villages, its fertile gardens, and its belt of palms, here and there intersected by streams from the mountains form a striking foreground to the grand mountain ranges. A good road now runs round the island, leading to Point Venus, the site in 1769 of Capt. Cook's observation of the transit of Venus.

Climate.—The seasons are not well defined. Damp is excessive, and the heat generally great, but the climate, on the whole, is not unhealthy.

The indigenous mammalian fauna is as scanty as in the other South Sea islands; of domestic animals, pigs of a small breed which died out on the introduction of stronger European strains—and, though this is more doubtful, dogs are said to have been plentiful when Capt. Wallis, as he supposed, "discovered" the island in 1767. Land birds are few in number and species as compared with those of the western Pacific islands. The lagoons swarm with fish of many species. Insects are poor in species though some of them are indigenous. Crustaceans and molluscs, on the other hand, are well represented; worms, echinoderms, and corals comparatively poorly. The most interesting feature of Tahitian conchology is the number of peculiar species of the genus *Partula,* almost every valley having a distinct form.

The Tahitian flora though luxuriant and beautiful is not very rich, especially in the smaller plants which form the undergrowth in similar islands. Especially remarkable are many indigenous species of banana, one form of which (peculiar in that its fruit-bunches are not pendent but grow upright) is abundant in the mountains, and formerly much used by the natives as food.

Part of the archipelago was discovered by Pedro F. Quiros in 1607. In 1767 Wallis named it King George's island. In 1768 de Bougainville visited Tahiti, claimed it as French, and named it La Nouvelle Cythère. In 1769 Cook named the Leeward group the Society islands in honour of the Royal Society, at whose instigation his expedition had been sent. Tahiti and the adjacent islands he called Georgian, but the first name was subsequently adopted for the whole group.

In 1903 it was decided that separate islands or groups should no longer be regarded as distinct establishments, but that all should be united into one colony. Thus the Society islands are joined for administrative purposes with the other French possessions in the eastern Pacific, the whole being administered by a governor with an administrative council consisting of certain officials, the *maire* of Papeete and the presidents of the chambers of commerce and agriculture. At Papeete there are a higher primary school, and a normal school and there were (1925) 63 primary schools. The chief industries on Tahiti are the preparation of copra, sugar and rum. Imports (1925) 43,966,400 francs, exports 50,550,511 francs. The imports include wheat, and metalwork, and the exports copra, mother-of-pearl, vanilla, coco-nuts and particularly phosphates (81,062 tons in 1925).

The third eastern Polynesian chain may be taken to include the Manihiki islands, the Tuamotu or Low Archipelago and Pitcairn island.

The Manihiki Archipelago is situated between 4° and 11° and 150° and 162° W. Manihiki (Humphrey island) itself an islet with a land area of about two square miles, pop. (1926) 416, encircling a lagoon of about 6 miles in diameter. Its shallow soil, nowhere raised much above sea-level, supports many tall coconut palms which serve to make the islet visible from a distance generally of about 12 m. The native population feed chiefly on coco-nuts and fish, and now have little for export except copra—though formerly pearl-shell, now practically exhausted, was dredged from the lagoon.

Almost directly east from Manihiki is a group of low coral islands of which the Caroline atoll, carrying many islets on a rim of coral surrounding a lagoon (some 7½ by 1½ miles) is a type; the other members of the group being Vostock and Flint islands. The natives of the group are Polynesians and nominally Christian. The islands were mostly discovered in the 19th century and were annexed by Great Britain mainly in 1888–1889. They are now administered by New Zealand.

The *Tuamotu* (*Paumotu*) *or Low Archipelago,* the northern extremity of which is situated between the Society and the Marquesas islands, consists of a great number of low coral islands, or rather atolls, of very similar character and appearance, trending in irregular lines from north-west to south-east, the major axis of the group extending over 1,300 miles. The total land area of the group is only 330 sq.m. Pop. (1924) 3,715. The largest

atoll, Rahiroa or Rangiroa, with a lagoon 45 m. long by 15 wide, carries 20 islets on its narrow rim; Fakarava, the next in size, carries 15 islets, and its oblong lagoon affords the best anchorage in the group. Hao (Harpe or Bow) atoll, 30 m. long with a width varying from 5 to 9 m., has some fifty islets around its lagoon —which is dangerously studded with coral heads. Anaa, or "Chain island" as Capt. Cook named it, 19 m. long with an average width of 6 miles, is remarkable in that it has, or recently had, a continuous growth of coco-nut palms along its entire rim, whereas when Capt. Cook visited it in 1769 the line of palms was so interrupted as to seem to grow from a number of regularly placed distinct islets—hence the name "Chain island"—this effect doubtless being due to the breaking of the line of trees by the great winds occasional in these parts.

The almost innumerable Tuamotu islands differ in character very little—except in size; with two exceptions, Tikei and Makatea, all are low coral atolls with but little natural vegetation except coco-nut palms and, occasionally a scanty undergrowth, chiefly screw-pines (Pandanus). The climate is healthy—with a lower mean temperature than Tahiti. The easterly trade wind prevails. Rain and fogs occur even during the dry season. The stormy season lasts from November to March, when devastating hurricanes are not uncommon, and a south-west swell renders the westerly shores dangerous. Animal life is scarce, a few rats are the only mammals; land birds are chiefly parakeets, thrushes and doves; insects are few. But marine life abounds in the lagoons and the surrounding seas; pearls and pearl-shell, abundant in many of the lagoons, provide the natives with their chief object of industry and trade. The natives are not numerous but are a fine strong race of Polynesians.

The first discovery of part of the archipelago was made by Pedro Fernandez Quiros in 1606. Many navigators subsequently discovered or re-discovered various parts of the group. The best harbour is Fakarava, the seat also of the French resident. Another harbour is Mangareva. The group passed under the protection of France in 1844, and was annexed in 1881 forming part of the dependency of Tahiti, and now administered jointly with other French possessions in the Eastern Pacific.

Pitcairn island (lat. 45° 4′ S., and long. 130° 19′ W.) is about 100 m. south from the nearest of the Tuamotu group, differs from most of the islands in this region in that it is without coral reefs but rises abruptly with steep and rugged basaltic cliffs. The highest point of the island is 2,000 ft., and its area is 2 sq m. Pop. (1914) 140. The soil in the islands is volcanic and fertile; but owing to the felling of the natural timber the liability to drought increases, as there are no streams. The climate is variable and rainy. It was discovered, uninhabited, by Carteret in 1767. Pitcairn was the name of the midshipman who first observed it. The present population are the descendants of the mutineers of the "Bounty" who occupied the island, which they found uninhabited in 1790, bringing with them from Tahiti six Polynesian men and twelve women; but it must be recorded that the finding by these new-comers of stone implements, rock-carvings, and other traces of humanity makes it certain that there had been previous inhabitants, or at least visitors, at some former time.

In religion the islanders are "Seventh Day Adventists." The island is a British colony and is administered by a council of seven members with a president (also chief magistrate), and a vice president (also Government secretary), subject to the control of the high commissioner for the Western Pacific since 1898. The island grows coffee, and has poultry and goats. The products include beans, sugar-cane, yams, taro, melons, sweet potatoes, oranges, pine-apples, bananas, arrowroot and other fruits and vegetables.

THE OUTLYING GROUPS

Within this section fall the Marquesas islands, Palmyra, Washington, Fanning and Christmas islands, the Hawaii islands, Easter island, Sala-y-Gomez, etc.

The *Marquesas Archipelago,* east from Caroline atoll, consists of two somewhat distinct groups of high volcanic islands, peculiar in the comparative rarity of coral fringes to their coasts. Total area 480 sq.m. Pop. (1924) 2,300. The north-western group has seven islands, the four largest being Ua Pou or Adam island, Ua Huka or Washington, Nukuhiva (70 m. in circumference, and the most important of the whole archipelago) and Eiao. The south-eastern group consists of the islands of Fatu Hiva or Magdalena, Motane or San Pedro, Tahuata or Santa Christina, and Hiva Oa or Dominica, the last with a coast-line of more than 60 m.

Along the centre of each of the main islands is a ridge of mountains, rising to between 3,000 and 4,000 ft., from which rugged spurs forming deep valleys stretch toward the sea. There are no active volcanoes. Vegetation is luxuriant in the valleys, which are well watered by streams. The flora is abundant, many of the species identical with those of the Society islands, but more indigenous land mammalian fauna is remarkably poor. Land birds are of comparatively few species. On the other hand, marine forms of animal life are as abundant as around other sub-tropical Polynesian groups. The climate is hot and damp but not unhealthy; the temperature during the six months' rainy season, which begins at the end of November, varies between 84° and 91°, and during the rest of the year between 77° and 86°. It is tempered by moderate easterly trade winds, and in the larger islands by the alternation of land and sea breezes. The natives, purely Polynesians, are reputed to be physically the finest of the South Sea islanders, and at the incoming of Europeans were numerous, warlike and active, but have since very greatly diminished in number and energy.

The islands were discovered in 1595 by Mendana who only knew the south-eastern group. The remaining islands were discovered from time to time subsequently. In 1842, after French Roman Catholic missionaries had prepared the way, the islands were annexed by France. The islands were almost abandoned between 1860–1870. They are now administered together with the other French possessions in the Eastern Pacific from Tahiti. The natives have outwardly adopted Christianity. Large numbers of swine and fowls are reared.

The Line islands (or America islands) north of the Equator, sometimes called Palmyra, Washington and Fanning, and Christmas islands, are low atolls which would hardly be distinguishable from a distance but for their tall coco-nut palms. Palmyra (1½ sq.m.), uninhabited but occasionally visited for the gathering of the coco-nut crop, the smallest, is remarkable in that it has three distinct lagoons. Washington (3½ by 1¼ miles), pop. 60, and Fanning (9½ by 4 miles), pop. (1926) 447, are of much greater importance, both having for many years been more or less successfully cultivated by Europeans employing labour imported from the Gilbert islands. Fanning, since 1902, has been a Pacific Cable Board station, with a large staff of employees. Christmas island (40 m. long, with an average width of 35 m.), pop. (1922) Europeans 4, Tahitians 28, the largest atoll in the Pacific, has been the scene of several attempts at coco-nut cultivation. It was discovered by Captain Cook in 1777 and annexed by Britain in 1888 and included in the Gilbert and Ellice Islands Colony in 1919. It was leased to the Central Coco-nut Plantations Ltd., for 87 years in 1914. South of the Equator the northernmost of the Line islands is Jarvis island (area 1½ sq.m., pop. 30), a small treeless and almost grassless islet, which has obviously been elevated some 10 or 12 ft. above sea-level; it has, or had, considerable deposits of guano. South-east from Jarvis island, a chain of more or less similar islets, the principal of which are Malden (35 sq.m.), Starbuck (1 sq.m.), extends—but at considerable distances from each other Caroline, Vostok and Flint atolls. All these islands belong to Britain, Fanning, Washington and Christmas islands being a part of the Gilbert and Ellice Islands Colony. Adjacent to Pitcairn island there are small uninhabited islands, namely Oeno and Ducie atolls, and Henderson, or Elizabeth island, which last named is remarkable as being an eighty feet high flat-topped island which appears to have been raised by some subterranean convulsion.

The Hawaiian group (Sandwich islands) are treated in a separate article. The remaining outlying Pacific islands, *e.g.,* Easter island, Sala-y-Gomez and the Galapagos islands are also treated elsewhere.

PACIFICO, DON or **DAVID PACIFICO** (1784–1854). A Portuguese Jew born a British subject in Gibraltar who brought an action against the Hellenic Government claiming £26,000 compensation for his house in Athens burnt down in 1847 in an anti-Semitic riot. Pacifico finally received compensation.

PACIFIC OCEAN, the largest division of the hydrosphere, lying between Asia and Australia and North and South America. It is nearly landlocked to the north, communicating with the Arctic ocean only by Bering strait, which is 65 km. wide and of small depth. The southern boundary was sometimes regarded as the parallel of 66½° S., but this limit is artificial, and it is now considered that the Pacific extends to the borders of the Antarctic continent, exactly as the Atlantic and Indian oceans do. As east and west boundaries in the higher southern latitudes one may take the meridians passing through South cape in Tasmania and Cape Horn. The north to south distance from Bering strait to Antarctica, near Cape Adare, is 15,500 km. or 8,350 nautical miles, and the Pacific attains its greatest breadth between Panama and Mindanao (Philippine Isl.), when it measures 17,200 km. or 9,300 nautical miles. The distance between Yokohama (Japan) and San Francisco is about half as great again as that from New York to Southampton; similarly the distance between Sydney and Cape Horn is greater than that from Buenos Aires to Cape Town by fully a half. The coasts of the Pacific are of varied contour. The American coasts are for the most part mountainous and unbroken, the chief indentation being the Gulf of California; but the general type is departed from in the extreme north and south, the southern coast of South America consisting of bays and fjords with scattered islands, while the coast of Alaska is similarly broken in the south and becomes low and swampy towards the north. The coast of Australia is high and unbroken; there are no inlets of considerable size, although the small openings include some of the finest harbours in the world, as Moreton bay and Port Jackson. The Asiatic coasts are for the most part low and irregular and a number of seas are more or less completely enclosed and cut off from communication with the open ocean. Bering sea is bounded by the Alaskan peninsula and the chain of the Aleutian islands; the Sea of Okhotsk is enclosed by the peninsula of Kamchatka and the Kurile islands; the Sea of Japan is shut off by Sakhalin island, the Japanese islands and the peninsula of Korea; the Yellow sea is an opening between the coast of China and Korea; the China sea lies between the Asiatic continent and the island of Formosa; the Philippine group, Palawan and Borneo. Amongst the islands of Malay archipelago are a number of enclosed areas —the Sulu, Celebes, Java, Banda and Arafura seas.

The question as to where within the Malay archipelago the limit between the Indian and Pacific oceans is to be drawn, is as difficult to answer as the question of the natural boundary between Further India and Australia. Wallace placed the latter in the Macassar strait, so that Borneo would belong to the Indian province, and Celebes to the Australian. So far as we know to-day we must argue, from oceanographic considerations, *e.g.*, the configuration of the sea floor, the properties of the water, etc., that the deep basins of the Sulu sea, Celebes sea, Flores sea, Savu sea and Banda sea, belong to the Pacific, while the shallow Java sea and the South China sea are part of the Indian ocean.

The Pacific was first scientifically explored by the great English Deep-Sea Expedition of H.M.S. "Challenger" (1872–76) and then by the German expedition of S.M.S. "Gazelle" (1874–76), by the two United States ships "Tuscarora" (1874–76, 1878–79) and "Albatross" (1888, 1890–92, 1899–1900, 1904–05), by the Russian warship "Vitiaz" (1887), by S.M.S. "Planet" (1906–14) and others. For many important soundings in the south-west Pacific we are indebted to H.M S. "Penguin" and many British cable ships; in high southern latitudes the "Discovery" (1901–04) carried out many observations. Lately many oceanographical enterprises have been prosecuted by the Japanese navy, as well as from the U.S. oceanographical station at San Diego (California).

Extent.—The area and volume of the Pacific ocean and its seas, with the mean depths calculated therefrom, are given in the article *Ocean*. The Pacific ocean has double the area of the Atlantic—the next largest division of the hydrosphere—and has more than double its volume of water. Its area is as much as the area of Africa, greater than the whole land surface of the globe, Antarctica included. The total land area draining to the Pacific is estimated by Murray at 19,400,000 sq.km., or little more than one-fourth of the area draining to the Atlantic. The American rivers draining to the Pacific, except the Yukon, Columbia and Colorado, are unimportant. The chief Asiatic rivers are the Amur, the Hwang-ho and the Yangtsze-kiang, none of which enters the open Pacific directly. Hence the proportion of purely oceanic area to the total area is greater in the Pacific than in the Atlantic.

Relief of Bed.—The bed of the Pacific is not naturally divided into physical regions, but for descriptive purposes the parts of the area lying east and west of 150° W. are conveniently dealt with separately. The eastern region is characterized by great uniformity of depth; the 4,000 metres line keeps close to the American coast except off the Isthmus of Panama, whence an ill-defined ridge of less than 4,000 metres runs, including the Galapagos islands, south-westwards, and again off the coast of South America in about 40° S., where a similar bank runs west and unites with the former. The bank then continues south to the Antarctic ocean, in about 110° W. Practically the whole of the north-east Pacific is therefore more than 4,000 metres deep, and the south-east has two roughly triangular spaces, including the greater part of the area, with depths of more than 4,000 metres. Notwithstanding this great average depth, the "deeps" or "trenches," deeper than 5,000 metres, which are so characteristic of the western Pacific, are small in number and extent in the eastern half along the west coasts of North and South America. Four small deeps are recognized along a line close to the coast of South America, and parallel to it, in the depression enclosed by the two banks mentioned; *i.e.*, along the coast of Chile and Peru between 35° and 10° S. The first deep (5,667 metres) lies with its centre off Valparaiso; the second and deepest (7,635 metres) has its centre off Taltal, and is called the Atacama trench; the third (6,867 metres) lies in the angle of the coast between Iquique and Mollendo; the fourth (5,868 metres) in front of Callao. All four deeps have their greatest depth between 100 and 400 km. from the coast.

The largest gulf on the north-west coast, off Puget sound and British Columbia, even at a great distance from land, reaches only the relatively small depth of less than 3,000 metres. East of 150° W. the Pacific has few islands; the oceanic islands are

volcanic, and coral formations are, of course, scanty. The most important group is the Galapagos islands. On the other hand in the western Pacific we have numberless great and small islands and island groups. They are sometimes set out in regular chains, at other times spread out irregularly over great areas. To the first type, in the north, belong the Aleutians, the Kuriles, the Japanese islands, the Riu-Kiu islands, the Philippines, and parallel to them the Pelew islands, the Yap group, the Bonin and Marianne group; in the Southern Hemisphere, the Solomon islands, the New Hebrides, New Caledonia and New Zealand. New Zealand morphologically is related northward to the Kermadec and Tonga islands, and southward through the Auckland islands to Macquarie island (550° S.). On the outside of nearly all these island chains are observed very deep, and sometimes fairly wide, trenches, in which depths of over 8,000, even over 10,000 metres, have been registered. This is the most important characteristic of the configuration of the Pacific floor; no other ocean has anything like it. The greatest deeps are the Aleutian trench (7,382 metres), the Kurile-Japanese trench (8,514 metres), the Philippine trench, eastward of north Mindanao in lat. 9° 42′ N. and long. 126° 51′ E., only 75 km. from the coast where in 1927 the German cruiser "Emden" measured the greatest of all sea depths, viz., 10,800 metres. In the same latitudes three other trenches are known, east of the Palau islands, east of Yap and south-east of Guam and the Marianne islands, where the United States telegraph ship "Nero" found a depth of 9,685 metres.

In the Southern Hemisphere between New Guinea and the Solomon islands is the Bougainville trench (9,140 metres). The New Caledonian trench has a depth of 7,570 metres. Finally, H.M.S. "Penguin" explored the Kermadec-Tonga trench which lies outside; *i.e.*, eastward of these groups between 36° S. and 16° S. and includes depths attaining 9,412 metres. The area of these long, deep regions is always small; these deeps lie parallel to the coasts of the present continents or to the coasts of earlier continents. In earlier geological epochs, for example, a continent may have extended eastward from New Guinea to the Tonga islands and New Zealand, and perhaps north to the Mariannes. It is certain that in these trenches, which lie in front of the fold mountains of eastern Asia, is to be sought a centre of great tectonic disturbances; just as the west coast of South America is afflicted by terrible earthquakes, whose epicentre lies in the trenches off Chile and Peru. The immense stretches of the west Pacific contain, besides these regular island groups and deeps, many irregularly strewn islands; *e.g.*, the Hawaii islands, the Carolines, the Gilbert islands, the Samoa archipelago, the Taumotu archipelago, etc. Most have volcanic cores; in low latitudes these islands are surrounded with coral reefs, or it may be that the reefs alone appear as atolls. In the great areas between these groups the sea floor sinks to depths exceeding 4,000 metres, sometimes even exceeding 6,000 metres. Thus the Pacific has an average depth of 4,028 metres; this average is greater than in any other ocean, the figure for the Atlantic being 3,332 metres. The following table showing the area of the floor at various depths for the Pacific is the work of Kossinna (1921):—

Metres	Areas	
	Sq. kilometres	%
0–200	10,207,600	5·7
200–1,000	5,627,100	3·1
1,000–2,000	7,018,400	3·9
2,000–3,000	9,384,000	5·2
3,000–4,000	33,248,100	18·5
4,000–5,000	63,074,200	35·2
5,000–6,000	47,727,700	26·6
6,000–7,000	2,957,800	1·6
7,000–8,000	302,000	
8,000–9,000	114,200	0·2
9,000+	17,900	
Total	179,679,000	100

Deposits.—The deeper parts of the bed of the Pacific are covered by deposits of red clay (*see* OCEAN), which occupies an area estimated at no less than 105,672,000 sq.km., or three-fifths of the whole. Over a large part of the central Pacific, far removed from any possible land influences or deposits of ooze, the red clay region is characterized by the occurrence of manganese, which gives the clay a chocolate colour, and manganese nodules are found in vast numbers, along with sharks' teeth and the ear-bones and other bones of whales. Radiolarian ooze is found in the central Pacific in a region between 15° N. to 10° S. and 140° E. to 150° W., occurring in seven distinct localities and covering an area of about 3,000,000 sq.km.; further, a wider strip of radiolarian ooze was discovered by the "Challenger" and the "Albatross," between 7° and 12° N. lat., stretching from 140° W. long. to the neighbourhood of the west coast of Central America, bringing the total area of the radiolarian ooze in the Pacific to about 10,000,000 sq. kilometres. Between these two areas, almost on the Equator, a strip of globigerina ooze was found corresponding to the zone of globigerina in the equatorial region of the Atlantic. Globigerina ooze covers considerable areas in the intermediate depths of the west and south Pacific—west of New Zealand, and along the parallel of 40° S., between 80°–98° W. and 150°–118° W.—but this deposit is not known in the north-eastern part of the basin. The total area covered by it is estimated at 30,000,000 sq.km.—about two-thirds of that in the Atlantic. Pteropod ooze occurs only in the neighbourhood of Fiji and other islands of the western Pacific, passing up into fine coral sands and mud. Diatom ooze has been found in a broad band between 57° and 67° S. lat., and thus in the Antarctic part of the Pacific, corresponding with its occurrence in the same latitudes in the Atlantic and Indian oceans.

Meteorology.—Partly on account of its great extent, and partly because there is no wide opening to the Arctic regions, the normal wind circulation is on the whole less modified in the north Pacific than in the Atlantic, except in the west, where the south-west monsoon of southern Asia controls the prevailing winds, its influence extending eastwards to 145° E., near the Ladrones, and southwards to the Equator. In the south Pacific, during the winter months of the Northern Hemisphere, the north-west monsoon of Australia affects a belt running east of New Guinea to the Solomon islands. In the east the north-east trade-belt extends between 5° and 25° N., the south-east trade crosses the Equator, and its mean southern limit is 25° S. The trade-winds are generally weaker and less persistent in the Pacific than in the Atlantic, and the intervening belt of equatorial calms is broader. Except in the east of the Pacific, the south-east trade is only fully developed during the southern winter; at other seasons the regular trade-belt is cut across from north-west to south-east by a band 20°–30° wide, in which the trades alternate with winds from north-east and north, and with calms, the calms prevailing chiefly at the boundary of the monsoon region (5° N.–15° S., 160°–185° E.). This area, in which the south-east trade is interrupted, includes the Fiji, Navigator and Society groups, and the Paumotus. In the Marquesas group the trade-wind is fairly constant.

The great warming and abundant rainfall of the island regions of the western south Pacific, and the low temperature of the surface water in the east, cause a displacement of the southern tropical maximum of pressure to the east; hence we have a permanent "south Pacific anti-cyclone" close to the coast of South America. The characteristic feature of the south-western Pacific is therefore the relatively low pressure and the existence of a true monsoon region in the middle of the trade-wind belt. It is to be noted that the climate of the islands of the Pacific becomes more and more healthy the farther they are from the monsoon region. The island regions of the Pacific are everywhere characterized by uniform high air-temperatures; the mean annual range varies from 1° to 9° F, and the diurnal range from 9° to 16°. In the monsoon region relative humidity is high, viz., 80 to 90%. The rainfall is abundant; in the western island groups there is no well-marked rainy season, but over the whole region the greater part of the rainfall takes place during the southern summer, even as far north as Hawaii.

The whole north Pacific from the tropic to the Bering sea has on its Asiatic side a monsoonal reversal of its prevailing winds.

winter and summer. In winter exceedingly dry and cold north-westerly winds, dependent on an air pressure maximum over Siberia and an air pressure minimum near the Aleutians, blow over the whole area; in summer, with low pressure over the Asiatic continent, warm and rainy south and south-easterly winds (in connection with the south-west monsoon of the China sea) prevail over the whole area of the Yellow sea, Japan sea, Okhotsk sea and Bering sea. On the American side of the Pacific this complete change of wind direction is absent, and throughout the year moist, warm winds from the ocean; *i.e.*, south-westerlies, prevail from Sitka to Vancouver, except for irregular changes in consequence of the passing of atmospheric depressions. These circumstances explain the great differences shown in the following table between the average air temperatures on the Australo-Asiatic side of the Pacific and on the American:—

Air Temperature (° F) and Rainfall (mm.) in the Pacific

Place	Lat.	Feb.	May	Aug.	Nov.	Year	Amplitude	Rain
Ajan, Sea of Okhotsk	56° N.	0·0	35·4	55·0	14·4	27·0	57·2	1,118
Sitka, U.S.A.	56° N.	32·5	44·1	54·9	36·7	42·5	22·4	2,070
Yokohama, Japan .	36° N.	40·8	63·3	78·1	51·3	57·7	38·2	1,476
San Francisco, U.S.A. .	36° N.	52·5	54·1	58·6	56·1	55·2	10·8	594
Sydney, Australia . .	34° S.	70·5	58·5	54·5	66·4	62·8	19·1	1,265
Valparaiso, Chile . .	34° S.	63·1	55·6	52·5	59·0	57·7	10·6	355

Temperature.—The distribution of temperature in the waters of the Pacific ocean has been fully investigated, so far as is possible with the existing observations, by G. Schott. At the surface an extensive area of maximum temperature (over 82° F) occurs over 10° on each side of the Equator to the west of the ocean. On the eastern side temperature falls to 72° F on the Equator and is slightly higher to north and south. In the north Pacific, beyond lat. 40°, the surface is generally warmer on the east than on the west, but this condition is, on the whole, reversed in corresponding southern latitudes. In the intermediate levels, down to depths not exceeding 1,000 metres, a remarkable distribution appears. A narrow strip of cold water runs between the Equator and 10° N., widest to the east and narrowing westward, and separates two areas of maximum which have their greatest intensity in the western part of the ocean and have their central portions in higher latitudes as depth increases, apparently tending constantly to a position in about latitude 20° to 30° N. and S. A comparison of this distribution with that of atmospheric pressure is of great interest. High temperature in the depth may be taken to mean descending water, just as high atmospheric pressure means descending air; low temperature in the depth may be taken to mean ascending water, as low pressure means ascending air, and hence it would seem that the slow vertical movement of water in the Pacific reproduces to some extent the phenomena of the "doldrums" and "horse latitudes." The isothermal lines, in fact, suggest that in the vast area of the Pacific something corresponding to a "planetary circulation" is established. In the greater depths of more than 2,000 metres, temperature is extraordinarily uniform, 80% of the existing observations falling within the limits of 34·8 and 35·5. In the enclosed seas of the western Pacific, temperature usually falls till a depth corresponding to that of the summit of the barriers which isolate them from the open ocean is reached, and below that point temperature is uniform to the bottom. In the Sulu sea, for example, a temperature of 50·4° F is reached at 700 metres, and this remains constant to the bottom in 4,660 metres.

Salinity.—The surface waters of the whole Pacific have less salt than those in the corresponding regions of the Atlantic. For example, the salt content west of San Francisco is 33·2‰, but west of Lisbon over 36‰; in the north-east trade region of the Pacific it measures only about 35‰, whereas, in the region of the Atlantic north-east trades, it is over 36‰ or 37‰. The reason for this is not yet known with certainty; probably evaporation is less than in the Pacific because of the smaller velocity of the wind, and the rainfall is greater than in the Atlantic. The geographical disposition of the varying salt content is essentially the same in the Pacific as in the Atlantic and Indian oceans. In each hemisphere, in the region of the north-east and south-east trade-winds, appears a broad zone with relatively the highest salt content. In northern latitudes its centre lies in the middle of the ocean; in southern latitudes it is in the eastern or South American half. Between these, mostly from 5°–10° N. lat., is a small strip of water poor in salt, stretching from the Philippines to the coast of Central America; here the salt content amounts to less than 34‰ in the west, less than 33‰ in the east, where, in the Gulf of Panama, 31‰ or even 30‰ have been observed. North and south also from the two first-named tropical maxima the salt content diminishes, particularly in the north Pacific. In the ocean off the Japanese islands, in spite of a warm current resembling the Gulf Stream, the salt content is only 34·5‰ or 34‰, almost 2‰ less than in the Atlantic. The Okhotsk and Bering seas, which perhaps can be compared with Baffin bay and the Norway sea, have 32–31‰, a salt content 2–3‰ less than the Atlantic regions named.

The distribution of saltness in the depths of the Pacific ocean is not yet sufficiently known, but it seems to correspond in the main with that ascertained for the Atlantic (*q.v.*).

Circulation.—The surface currents of the Pacific have not been studied in the same detail as those of the Atlantic, and their seasonal variations are little known except in the monsoon regions. Speaking generally, however, it may be said that they are for the most part under the direct control of the prevailing winds. The North Equatorial current is due to the action of the north-east trades. It splits into two parts east of the Philippines, one division flowing northwards as the Kuro Siwo or Black Stream, the analogue of the Gulf Stream, to feed a drift circulation which follows the winds of the north Pacific, and finally forms the Californian current flowing south-eastwards along the American coast. Part of this rejoins the North Equatorial current, and part probably forms the variable Mexican current, which follows the coasts of Mexico and California close to the land. The Equatorial Counter-current flowing eastwards is largely assisted during the latter half of the year by the south-west monsoon, and from July to October the south-west winds prevailing east of 150° E. further strengthen the current, but later in the year the easterly winds weaken or even destroy it. Between the Kuro Siwo and the Asiatic coast; *i.e.*, east of the Kuriles and Kamchatka, a band of cold water with a slight movement to the southward, known as the Oya Siwo, forms an analogue of the "cold wall" of the Atlantic. In the Japan sea, too, on the Siberian coast, as well as in the Yellow sea on the Chinese coast, there flows southward, during the greater part of the year, cold water poor in salt. This current is easily recognized from its green colour in the Straits of Formosa as far as Hong Kong. In the Southern Hemisphere the South Equatorial current is produced by the south-east trades, and is much more vigorous than its northern counterpart. On reaching the western Pacific, part of this current passes southwards, east of New Zealand, and again east of Australia, as the east Australian current parts northwards to join the Equatorial Counter-current. In the higher latitudes of the south Pacific the surface movement forms part of the west wind-drift of the Roaring Forties.

The cold water of this stream, with contributions from the depths, on the coasts of Chile and Peru, gives rise to the scantiness of the rain in this region as far northward as Callao and Payta, an effect analogous to that of the Benguela current along the coast of South-west Africa. Sometimes it appears that this Peruvian current in the northern part is hemmed in by the warmer water of the "El niño" current, which spreads southward from the coast of Colombia and Ecuador. This has disastrous consequences for the animal world: the guano-birds and the fish die. It also has fatal effects on the coast regions, for the rain associated with the warm current entails great economic injury on

this erstwhile desert-like region. Such a catastrophe occurred last in Peru between January and March 1925.

See *Reports* of expeditions of the U.S.S. "Albatross" and "Thetis" (1888–92); A. Agassiz, *Expedition to the Tropical Pacific* (1899–1900, 1904–05); H.M.S. "Challenger" (1873–76); "Egeria" (1888–89 and 1899); "Elisabeth" (1877); "Gazelle" (1875–76); "Planet" (1906); "Penguin" (1891–1903); "Tuscarora" (1873–74); "Vettor Pisani" (1884); "Vitiaz" (1887–88); also observations of surveying and cable ships, and special papers in the *Annalen der Hydrographie;* for distribution of temperature and for currents *see* H. Thorade, p. 17 (1909); G. Schott, p. 2 (1910); B. Schulz, p. 177 (1911); F. Zorck, p. 166 (1928); for salinity *see* G. Schott, p. 148 (1928) and in the Archiv der Seewarte (G. Schott, 1891; C. Puls, 1895).

PACIFIC OCEAN QUESTIONS. The huge expanse of the Pacific, covering half the globe, has obstructed human migration and intercourse till recent times. There was only one way of reaching America from Asia, and that was over Behring's Straits, a shallow connection between the Arctic and the Pacific, 36 m. broad. It was doubtless across this gap that the New World was peopled. The Kuro Siwo or tropical current which runs north along the East Coast of Japan and when it reaches its northern limit bends south-east along the American Coast may have carried craft on to a shore far from home, and thus Japanese or Chinese junks may have been borne on to the islands on the north-west coast of America or even on to the continent itself. There is a zone of westerly winds that might assist seacraft from Asia to America, but the equatorial zone of calms and variable winds makes migration or even drift across the broadest part of the ocean improbable. The southern zone of westerlies, commonly called "the roaring forties" lying between 40 and 60 degrees south is the only one that could give easy passage from west to east such as a migration or trade route demands; but the landless character of the Pacific there makes it improbable, especially as an unmaritime people occupied Australia, and New Zealand was uninhabited till the daring sailors of Polynesia reached it. After that time Maori canoes seem to have come as far east as the South American coast as evidenced by the likeness of the Araucanian stone axe to the Polynesian, and especially the identity of the name for it in both regions (*toki*), the identity of a polished war-club with cutting edges and wristcord found early last century in a grave in Ecuador with the Maori *mere*, the use of the earth-oven and of an intoxicating drink made by chewing the root of a plant in ancient Chile, and especially the identity of the Araucanian name of this last (*cawau*) with that of the similarly brewed Polynesian drink (*kawa*).

Problem of Polynesia.—By far the most difficult of Pacific questions is that of the peopling of the far-spread groups of the centre and east of the Ocean. The voyagers of the 18th century observed the identity of the people who occupied the widely-divided islands of this vast region in customs, language and physique, and called them the Polynesians, or people of the many islands. And when they went away west through Melanesia, Papuasia and Indonesia and found that most of the languages they encountered had a proportion of their vocabulary manifestly related to, if not identical with, Polynesian words, and the numerals the same all through, they assumed that the language was one and the same, and called it Malayo-Polynesian. The further conclusion that it indicated the same race was too manifestly in conflict with the pronounced racial differences to be long held. That there is a negroid element in the physique of many Polynesians is undenied, but how it came into the Pacific is one of its difficult questions; for the universal custom in Polynesia of massaging the nose of the baby as soon as it is born, into the flat, negroid form, is meant to add to the beauty of the face, and that idea of beauty could not have arisen if there was an aboriginal negroid race in the islands, which the newcomers subdued. The ethnologist must rely on other features of the physique; and there are plenty to distinguish this people from those to the west of them.

The Age of Steam.—It was the age of steam that brought the Pacific ocean into world history and made Pacific questions urgent. The era that was to bring the two great cultured racial sections of mankind into closer contact and to make the great ocean fulfill its destiny as the arena of history began when the pursuit of gold drew crowds to California and Australia; but not in earnest till railways across North America commenced to direct the trail of the immigrants to the western lands and the cheapness and capacity of steamer traffic peopled the east of Australia and New Zealand and drew to it Oriental traders and labourers. Not till near the end of the 19th century did the white man realise the great part the Pacific was to play in the history of mankind.

China and Japan.—The Suez canal came earlier; but that would have been cut had there been no great ocean beyond Asia; its aim was to bring Oriental possessions nearer to their managers and the Oriental market nearer to the manufacturing nations of Europe. The greatest of all Oriental markets, China, was the last to come within the range of Western commerce, though the Arabs had been trading with Canton for many centuries. Like all lands enriched by the overflow of rivers, northern and eastern China were early populated and were organised first socially and then politically soon after the old stone age gave way to the neolithic. But the spill of peoples from the steppes of central Asia continued to be recurrent. The northern plains and plateaux of China were ever overcrowded, and drought or flood from "China's sorrow," the Hwang Ho, followed by famine, caused the people to overflow southwards into a zone that was warmer and seldom or never troubled with droughts. Thus this rich section of the earth came to hold one-fourth of the human race, so wedded to the soil and to the graves of their ancestry that it became the most stable of peoples, ready for the strong and vigorous ruler to civilise and unify; and when civil war ceased it had long periods of peace that made it easy for so prolific a race to fill its borders to overflowing, ripe for the discipline of famine and plague.

Further north the closer proximity of the Japanese islands to the continental coast stimulated migration throughout at least the neolithic and bronze ages. It was doubtless the central Asiatic push that drove the Mongoloids over the straits of Tsushima in the bronze age. But they found the archipelago already filled with a vigorous Caucasoid people whom they called the "hairy Ainu" because of their having much face-hair. Though aided and led by a seafaring people who came overseas from the south, it took them till the 12th century to drive the aborigines north of Tokio. That another race different from all three had found its way into the archipelago is evident in the tall people over the mountains of the central island.

The East and West developed their civilisations in isolation from each other. Japan closed its doors against alien civilisations and foreign commerce just when with its maritime bent it might have gone freely all over the great ocean and planted its colonies in Indonesia, Australia and New Zealand and on the western shores of America without any hindrance. At its awakening in the latter part of the 19th century and its welcome to Occidental trade and culture the Occident had placed its mark upon these lands and begun to pour in its immigrants. Now that the East is eager to find issues for the overflow of its prolific population, the white man has fenced in by head tax and prohibitions these open lands to the west and south against the Oriental who has to find the main arena for his immigration on the continent of Asia. The islands of the ocean where it is not merely welcomed but sought after affords but little scope for a country like China which, according to a recent rough Shanghai estimate, added nearly 50,000,000 to its population between 1923 and 1926, in spite of civil war, and like Japan which added 700,000 to its 65,000,000 in 1927, in spite of its decreasing birth-rate and increasing death-rate.

Industrialization of the East.—Manchuria is, now that it has a network of railways, giving issue to the overflow of China, nearly a million trooped into it in 1927, chiefly from northern China which was harassed with civil war and famine and especially from Shantung. Japan, after the defeat of Russia, thought it had secured an arena for its overflow in taking over the Southern Manchurian railway, but failed to turn the current of emigration thither; in 1909, for example, 600,000 Japanese entered, but by the end of the year, 575,000 had gone back to their own land But Manchuria is essential to the life of Japan as a producer of its food, of raw material for its manufactures and of profit from

its railways; little wonder that Japan is ever expanding the railway system and making the future of this great market secure. For the island nation is rapidly industrializing itself as the only solution of its problem of over-population. Whether this is to be the solution of China's still more clamant problem after Manchuria and Mongolia and eastern Siberia have received their full complement of farmers and coolies is a Pacific question that will have to be answered before the end of this century. The process has already begun in the cities on the deltas of the rivers; the labour is cheap enough and, in its own way, virile enough; but its financial success depends on the honesty and thoroughness of the business methods; and hitherto few or no Chinese companies have paid dividend and the railways managed by the Chinese are failures. This is due to the eleventh commandment of "squeeze," a tradition born of the payment of Government officials by what they could extract from the tax-payers. It is still a question whether Oriental mass-production managed by Orientals can attain the standard and honesty of the former individual craftsmanship; and on that depends the stability of the markets the products may find.

Whether China can follow the lead of Japan and westernize its ancient civilization is the question of Pacific questions, when we consider the mass and fecundity of its population and the potentialities of its resources. As yet its republican form of Government has proved itself a failure. How long it will take to make it a reality instead of a pretence depends upon the answer to a variety of questions; chief of which is this: Can a nation so huge and unorganized overcome the handicap of its script as Japan has done and make education universal and compulsory? A Chinese scholar, James Yen, of Pekin, has reduced the 10,000 ideographs essential for education to 1,000, and, within a year or two, has had a million of his countrymen taught them through volunteer teachers. Japan has raised the standard of living of her population at least 50% in spite of the doubling of its numbers during the last half-century; this she has done by her vigorous industrialization; but she is the most organizable of Oriental nations, because of her insular character, the absence of disturbing racial differences, and the atmosphere of social discipline that was left when the revolution abolished the privileges of her highly-educated aristocracy; but most of all because she set herself at once to the task of establishing a system of universal education.

Russia.—One of the most interesting of Pacific questions is how far Bolshevik Russia will succeed in the Orient. In China its propaganda is probably doomed to failure because of the almost universal peasant-proprietorship; but if it has fallen heir to the Oriental ambitions of Tsarist Russia, there is bound to be a triangular conflict in Manchuria; it cannot abandon the shorter route to the Pacific by the Chinese Eastern railway through north Manchuria. Japan cannot abandon its claims on Manchuria as the best source of its food and raw material for manufactures and its best market; nor can China cease to proclaim this great province outside the Great Wall her own now that it is filling up with Chinese.

The Future.—Advance towards the conciliation between East and West will not be possible till this is settled. And the mutual influence of their culture and civilization will be of little avail unless there is peace and mutual respect between them. Occidentals must give up their arrogant assumption of superiority and cease thinking of Oriental social customs and religious attitudes as futilities to be thrust aside for what they introduce, whilst Orientals must learn to recognize what the "foreign devils" have done for their commerce and the development of their countries. The Pacific ocean is the arena in which must be worked out the problems of the unification of mankind; for here have been brought face to face the racial types that have shown the greatest capacity for advance in civilization.

The process of human hybridization has grown slower as nations have become stable and will grow slower still as national consciousness becomes more definite in its aims. And in the Pacific ocean, the new stage set for the next drama of human evolution, the action may drag through acts that each may take 10,000 or even 100,000 years to reach its *dénouement,* so contrasted are the peoples and cultures, so broad the sea that divides them, so slow the processes that have to depend only on commercial intercourse.

The most hopeful omen is the rapidity with which Japan has absorbed Occidental culture and yet come out of the process strong in her personality and national character. It was her national environment that made this abnormal rapidity sure without a devastating revolution. An island or extensive archipelago lying not far off a populous continent in the temperate zone, the zone of enterprise and initiative, and across the latitudes so as to secure a constant flow of variations for selection to work on, once it attains a unity, is bound to make swift and easy progress and to a play a dominant part in the ocean around it, if not in the world as a whole. Japan is the counterpart in the Pacific of Britain in the Atlantic. There are two other insular unities in the ocean that have a similar environment, New Zealand in the south and Vancouver in the north; whether they will have a large part to play is an interesting question; one is too far from its still sparsely populated island-continent and the other too much in the shadow of Canada to enter soon into the dominance that is the natural heritage of such an environment; but both will have that combination of a sailor-breed and a mountain-breed which makes a people bold in enterprise and passionately devoted to freedom; they will be the maritime shields of their neighbours. The very isolation of New Zealand will make her capable of controlling her own destiny and transmitting pure her Anglo-Saxon culture and tradition, whilst her proximity to the islands of the South Seas will make her dominant in their development and prosperity. How Australia is to fill her empty spaces and preserve her white tradition so far from Europe and so near to the East is one of the most clamant Pacific questions and next to it stands in importance how she is to develop her vast droughty, if not desert, areas. As for British Columbia and Canada, as a whole they lie in the shadow of the great republic and for generations will be more or less dependent on her for capital and development.

It is significant that three of the most developable countries that abut on the ocean are English-speaking, and that the peoples of Anglo-Saxon descent have been amongst the most enterprising in pushing their way both by land and sea but especially by sea; they have been the most successful of pioneers in colonization and commerce. It looks as if English were ultimately to be the dominant language in the Pacific ocean; and a sign of this is that pidgin-English is the favourite medium of communication between Chinese of different dialects besides being the favourite linguistic intermediary in the islands of the ocean even when owned and managed by peoples that speak another European language. The Polynesian dialect of the isolated Easter island though moulded by French missionaries and Chilean officials has ten times more English words embedded in it than French and Spanish combined. And the large Oriental element in the trade and labour of the South Seas make pidgin-English their means of intercourse. The only language besides English that seems to have much chance of spreading in the ocean is the Japanese; for it belongs to a people that is naturally seafaring, commercial and colonizing.

It is not easy to answer what type of political system is likely to spread in the Pacific ocean and to dominate in the far future the world unity that is the desire and may be the goal of mankind.

Two that abut on the ocean and share largely in its traffic present each a type that has a strong chance of survival because they are capable of sheltering and unifying varied kinds of communities; and both belong to the English-speaking peoples. One is the United States; it is a federal system that permits of the freest intercourse between its separate states whilst giving each its own legislative individuality; for it has lowered all tariff barriers. The other is the British commonwealth of nations which spreading round the world keeps its units in vital intercourse by protected maritime traffic and by periodical conferences that decide how they can assist and guard one another's freedom and interests. An amalgamation of these two types may produce the

final type that will fit a unified human race. It will allow of the greatest liberty of development to each of the national units whilst watching over their freedom of commercial and migrative intercourse. It may take tens, perhaps hundreds, of thousands of years to evolve; but the first arena for its evolution will probably be the Pacific ocean

PACK, OTTO VON (*c.* 1480–1537), German conspirator In 1528 he revealed to Philip, landgrave of Hesse, the details of a scheme agreed upon in Breslau by the archduke Ferdinand, afterwards the emperor Ferdinand I, and other influential princes, to conquer Hungary for Ferdinand and then to attack the reformers in Germany Pack was sent to Hungary to concert joint measures with John Zapolya, but John, elector of Saxony, advised that the associates of Ferdinand should be asked to explain their conduct and Pack's revelations were discovered to be false, the copy of the treaty which he had shown to Philip proving to be a forgery Pack was seized in the Netherlands at the request of Duke George Examined under torture he admitted the forgery, and was executed on Feb 8, 1537 It is uncertain whether Philip was deceived by Pack, or was his assistant in concocting the scheme

See W Schomburgk, *Die Packschen Handel* (Leipzig, 1882), H. Schwarz, *Landgraf Philipp von Hessen und die Packschen Handel* (Leipzig, 1881), St Ehses, *Geschichte der Packschen Handel* (Freiburg, 1881) and *Landgraf Philipp von Hessen und Otto von Pack* (Freiburg, 1886).

PACKER, ASA (1805–1879), American capitalist, was born in Mystic, Connecticut, on Dec 29 1805 He worked as a carpenter in New York city for a time and then built canal-boats and locks for the Lehigh Coal & Navigation Company, probably the first through shippers to New York Between 1852 and 1855 a railway line was built for the Lehigh Valley Railroad Company, largely by Packer's personal credit, from Mauch Chunk to Easton He built the extension of the line into the Susquehanna valley and thence to connect with the Erie railway. In 1841 and 1842 he was a member of the Pennsylvania House of Representatives; in 1843–1848 was county judge of Carbon county, in 1853–1857 was a Democratic member of the national House of Representatives In 1865 he gave money and land in South Bethlehem, Pennsylvania, for a technical school; Packer Hall, of Lehigh University was completed in 1869; he erected a memorial library building in 1877; and the university, by his will, received nearly one third of his estate He died in Philadelphia on May 17, 1879

PACKING HOUSE: *see* ABATTOIR and SLAUGHTER HOUSE

PACORUS, a Parthian name, borne by two Parthian princes

1. PACORUS, son of Orodes I, was, after the battle of Carrhae, sent by his father into Syria at the head of an army in 52 B C The prince was still very young, and the real leader was Osaces He was defeated and killed by C. Cassius, and soon after Pacorus was recalled by his father, because one of the satraps had rebelled and proclaimed him king (Dio Cass. xl 28 *sqq*; Justin xlii. 4; *cf.* Cicero, *ad Fam.* xv. 1; *ad Att* vi. 1. 14). Father and son were reconciled, but the war against the Romans was always deferred In the autumn of 45 Pacorus and the Arabic chieftain Alchaudonius came to the help of Q. Caecilius Bassus, who had rebelled against Caesar in Syria; but Pacorus soon returned, as his troops were unable to operate in the winter (Cic. *ad Att.* xiv 9 3; Dio Cass xlvii 27) At last in 40 B C. the Roman fugitive Titus Labienus induced Orodes to send a great army under the command of Pacorus against the Roman provinces. Pacorus conquered the whole of Syria and Phoenicia with the exception of Tyre, and invaded Palestine, where he plundered Jerusalem, deposed Hyrcanus, and made his nephew Antigonus king Meanwhile Labienus occupied Cilicia and the southern parts of Asia Minor down to the Carian coast (Dio Cass. xlviii 26; Strabo xiv. 660). But in 39 P. Ventidius Bassus, the general of Mark Antony, drove him back into Cilicia, where he was killed, defeated the Parthians in Syria (Dio Cass. xlviii. 39 *sqq*) and at last beat Pacorus at Gindarus (in northern Syria), on the 9th of June, 38, the anniversary of the battle of Carrhae Pacorus himself was slain in the battle, which effectually stopped the Parthian conquests west of the Euphrates

2 PACORUS, Parthian king, only mentioned by Dio Cass lxviii 17, Arrian, *ap.* Suid., *s v.* ὠνητή, according to whom he sold the kingdom of Osroëne to Abgar VII.; and Ammianus Marcellinus xxiii. 6 23, who mentions that he enlarged Ctesiphon and built its walls But from his numerous dated coins we learn that he was on the throne, with interruptions, from A D 78–95 He always calls himself Arsaces Pacorus This mention of his proper name, together with the royal name Arsaces, shows that his kingdom was disputed by rivals. Two of them we know from coins—Vologaeses II, who appears from 77–79 and again from 111–146, and Artabanus III in 80 and 81. Pacorus may have died about 105; he was succeeded by his brother Osroes. (ED M)

PACUVIUS, MARCUS (*c.* 220–130 B C.), Roman tragic poet, was the nephew and pupil of Ennius, by whom Roman tragedy was first raised to a position of influence and dignity Like Ennius he probably belonged to an Oscan stock, and was born at Brundusium, which had become a Roman colony in 244 Hence he never attained to idiomatic purity of style. Pacuvius obtained distinction also as a painter; and the elder Pliny (*Nat Hist* xxxv 19) mentions a work of his in the temple of Hercules in the *Forum boarium* We know of 12 plays on Greek subjects, mostly connected with the Trojan cycle, and one *praetexta*, the *Paulus*, written to commemorate the victory of Pydna in 168 He continued to write tragedies till the age of 80, when he exhibited a play in the same year as Accius, who was then 30 years of age He retired to Tarentum for the last years of his life, and a story is told by Gellius (xiii 2) which is probably fictitious, of his being visited there by Accius on his way to Asia, who read his *Atreus* to him The story is designed to illustrate the traditionary criticism (Horace, *Epp* II i 54) of the two poets, the elder noted for elegance, the younger for vigour Cicero, who frequently quotes from Pacuvius with admiration, appears (*De optimo genere oratorum*, i) to rank him first among the Roman tragic poets

The fragments of Pacuvius quoted by Cicero in illustration or enforcement of his own ethical teaching appeal, by the fortitude, dignity, and magnanimity of the sentiment expressed in them, to what was noblest in the Roman temperament, while revealing a humanity of sentiment that was more unusual Among the passages quoted from Pacuvius are several which indicate a taste both for physical and ethical speculation, and others which expose the pretensions of religious imposture, tendencies common to the tragic poets of the period These poets also contributed to the development of the language into an organ peculiarly suited to oratory But the new creative effort in language was accompanied by considerable crudeness of execution, and the novel word-formations and varieties of inflexion introduced by Pacuvius exposed him to the ridicule of the satirist Lucilius But notwithstanding the attempt to introduce an alien element into the Roman language, which proved incompatible with its natural genius, and his own failure to attain the idiomatic purity of Naevius, Plautus or Terence, the fragments of his dramas are sufficient to prove the service which he rendered to the formation of the literary language of Rome as well as to the culture of his contemporaries

Fragments in O. Ribbeck, *Fragmenta scaenicae romanorum poesis* (1897), vol. i; *see* also his *Romische Tragodie* (1875); L Muller, *De Pacuvii fabulis* (1889), W. S Teuffel, *Caecilius Statius, Pacuvius, Attius, Afranius* (1858); and Mommsen, *History of Rome*, bk. iv ch 13.

PADANG, the chief port on the west coast of Sumatra and capital of the residency of the west coast of Sumatra, Dutch East Indies, population 41,238 (2,548 Europeans and Eurasians). Padang, which is 572 miles from Batavia, has prospered exceedingly since the opening-up of the Padang highlands with their

great mineral wealth, tourist traffic, and the general extension of cultivation in Sumatra West Coast residency, aided by the construction of a railway along the coast to Sungei Limau and inland to Fort de Kock and Pajo Kumbu, and, branching off from Padang Panjang, to Sawah Lunto, and the harbour facilities of Emma Harbour. The town, which is the seat of the resident, and the headquarters of the railway, with offices, workshops, etc., and is overlooked by the Apenberg or Ape mountain, right on the coast, is beautifully laid out, with fine, well-kept roads and houses surrounded by large gardens. Many of the native houses are built on piles, and have thatched roofs, and, despite its modern buildings, Padang still possesses a rustic charm, and it has a cooler climate than most coastal towns so near the equator. The port, which is approached from the sea through a multitude of tiny evergreen islets, lies a short distance south-east of the town, on the north-west side of Köninginne bay (Queen's bay), and from it are exported copra, coffee, quinine, mace, damar, hides, rattans, and coal from the great Ombilin coal-fields which, in 1925, produced 543,745 tons. Emma Harbour, constructed between 1880–1890, has two breakwaters, one 900 metres long, projecting at right angles to the coast; the other, 260 metres, running parallel with the coast across a coral bank: these give a harbour surface of one square kilometre. There are four wharves, with a total length of 433 metres, for general cargo, also a special coal wharf, and salt, petroleum and dynamite wharves. The coal wharf has a shute with a capacity of 300 tons per hour, two electric conveyers of 120 tons per hour, and a floating conveyer. Emma Harbour affords very frequent communication between Sumatra West Coast and Java and British Malayan ports, and it is a port of call for steamers from Europe, Australia, China, India and Japan. Imports in 1926 were 22,563,046, and exports 27,289,775 gulders. Padang is one of the oldest Dutch settlements in Sumatra. As early as 1606 an official of the Vereenigde Oost Indische Compagnie (United Dutch East India Company), was sent from Batavia with orders to appoint residents on the west coast of Sumatra and to found factories there, and Padang seems to have been one of the earliest of these, for in 1664 it was styled the capital of Sumatra's West Coast, and three years later a small fort and some warehouses were erected on the banks of the Padang river, to support the resident and his small staff in their tenure. The fortress was demolished by the British in 1793, and was found still in ruins when Padang was paid a visit, later in the same year, by the French buccaneer Lemesme, in his vessel "La Ville de Bordeaux." In November 1795 Padang and the west coast of Sumatra were captured by a British force, and a garrison, reinforced from Bencoolen, was maintained at Padang, the town and the district remaining under British control until May, 1819.

PADANG HIGHLANDS, the name given to the mountainous hinterland of the Sumatra West Coast residency, of Sumatra, and which, possessing magnificent scenery and a salubrious climate, has become one of the chief health and pleasure resorts of the Dutch East Indies. It can be reached either from the port of Belawan on the east coast of Sumatra, or from Padang on the west coast, since an excellent motor road runs across the country from Belawan and Medan to Padang which penetrates the heart of the Padang highlands. Fort de Kock, 2,700 ft., the mountain capital, and the seat of an Assistant Resident, has a population of 12,624 (510 Europeans), and is an ideal centre for exploring the district. From here can be reached easily, by road, the Kloof of Harau, the falls of Sungei Puar, the caves of Kamar and Baso, Sungei Jarni, and its pond with holy fishes, and Puntjak Bukit and Padang Galanggang.

PADDINGTON, a north-western metropolitan borough of London, England, bounded E. by Hampstead and Marylebone, S. by the city of Westminster, and W. by Kensington, and extending N. to the boundary of the county of London. Pop. (1921) 144,261. The north-east is the residential quarter. It contains the terminus of the G.W. railway. The name of Paddington finds no place in Domesday—it may have been included in the manor of Tyburn—and the land belonged to the abbey of Westminster at an early date. It was granted to the see of London by Edward VI. In the 18th century the rural scenery attracted artists, and even in the middle of the 19th the open country was reached within the confines of the present borough, which now contains no traces of antiquity. Bayswater is said to take its name from Baynard, a Norman, who after the Conquest held land here and had a castle by the Thames not far above the Tower. Many springs flowed forth here; the stream called Westbourne was near at hand, and water was formerly supplied hence to London. The parliamentary borough of Paddington has two divisions, each returning one member.

PADDLEFISH, the common name in North America for the spoonbill sturgeon (*Polyodon spathula*) of the Mississippi basin, which reaches a length of six feet and a weight of 150 lb. with a dark green smooth skin and long, bony, spoon-shaped snout. It is edible; the roe is made into caviar. (*See* FISH; STURGEON.)

PADDLE-WHEEL: *see* SHIPBUILDING.

PADDY-BIRD, the name given in India to *Ardeola grayii*, also known as the pond heron. About as big as a jackdaw, the paddy-bird has a pied plumage of drab and white. The name "paddy-bird" is used by whalers to denote the sheathbill (*q.v.*).

PADERBORN, a town and episcopal see in the Prussian province of Westphalia, 63 m. N.E. from Dortmund on the railway to Berlin via Altenbeken. Pop. (1925) 33,205, of whom about 80% are Roman Catholics. Paderborn owes its early development to Charlemagne, who held a diet here in 777 and made it the seat of a bishop a few years later. The city about the year 1000 was surrounded with walls. It joined the Hanseatic League, obtained many of the privileges of a free Imperial town, and endeavoured to assert its independence of the bishop. The citizens accepted the reformed doctrines, but the older faith was restored in 1604. The bishopric of Paderborn formed part of the archdiocese of Mainz, and its bishop became a prince of the empire about 1100. It was secularized in 1803 and was given to Prussia. The bishopric had an area of nearly 1,000 sq.m. and a population of about 100,000. A new bishopric of Paderborn, with ecclesiastical authority only, was established in 1821.

The town derives its name from the springs of the Pader, a small affluent of the Lippe, which rise in the town under the cathedral to the number of nearly 200, and with such force as to drive several mills within a few yards of their source. A large part of the town has been rebuilt since a great fire of 1875. It possessed a university, founded in 1614, but this was closed in 1819 The manufactures of the town include glass, soap, tobacco, boots, organs and beer; and there is a trade in grain and cattle.

PADEREWSKI, IGNAZ JAN (1860–), Polish pianist, composer and statesman, was born at Kurylówka, Podolia, a province of (then) Russian Poland. He studied music at Warsaw, Berlin and at Vienna, where he was a pupil of Leschetizky (*q.v.*). He made his first public appearance in Vienna in 1887, in Paris in 1889, and in London in 1890. His brilliant playing created a *furore* which went to extravagant lengths; and his triumphs were repeated in America in 1891. He was a great virtuoso player, and as such commanded popular applause, but he was much more than that; he brought to bear on the music he played a highly trained and original mind. The Paderewski renderings often countered tradition but they were the fruit of profound and serious study. In 1899 he married Baroness de Rosen, and after 1900 he appeared but little in public until 1920–23 when he gave recitals in England and in America as well as on the Continent.

Paderewski's first considerable work was the opera *Manru*, played at Dresden (May 29, 1901), and in 1902 at New York. Beside numerous works composed for his own instrument, including a concerto for pianoforte and orchestra in A minor (op. 17), he wrote a symphony (in B minor), which was played with success at Boston, Mass., and in London in 1909.

Paderewski's unprecedented success as a pianist all over the world never caused him to forget his own country, and to the Poles in America he delivered the following inspiring message: "The vision of a strong and independent Poland has always been the lodestar of my existence. Its realisation is still the great aim of my life." In 1910, on the 500th anniversary of the victory of Grünwald over the Teutonic knights, he presented a memorial,

which was unveiled at Cracow

When the World War broke out in 1914, he dedicated himself heart and soul to his country's service. He was *président d'honneur* of a non-party group of Poles who met at Vevey in the autumn of 1914 to organise a "General Committee of Assistance for the victims of the War in Poland" The Committee was definitely founded in Jan. 1915 under the presidency of Sienkiewicz. Paderewski established branches in Paris and London, he then went to the United States, where he remained nearly four years, giving numerous concerts and championing the cause of Poland He collected enormous sums, and created a powerful pro-Polish movement in the United States The value of his propagandist work was realised when, on Jan 22, 1917, President Wilson alluded to a "united, independent and autonomous Poland" By November 1916 every Polish organisation in the U S A was represented in the Polish National Department of Chicago, except the small Socialist group Up to 1918 Paderewski guided the political and military destinies of 4,000,000 Poles in the United States

Foreseeing in Feb 1917 that the U S A would soon enter the War, Paderewski induced the Polish National Alliance to found a preparatory school for Polish officers at Cambridge Springs. After the decree which authorised a Polish army to be raised in France Paderewski obtained on Nov. 1917 from Newton Baker, permission to recruit volunteers He secured from the Canadian Govt a vast military camp, Niagara on the Lake, where more than 22,000 Polish volunteers were trained by Canadian officers In Aug 1917 the Polish National Guard Committee, founded at Lausanne, chose him as its representative at Washington

After the victory of the Allies, Paderewski visited London and afterwards proceeded to Poland by sea in the company of a British Mission under Colonel Wade, disembarking at Danzig on Dec 24, 1918 On reaching Warsaw he declared himself independent of all political parties, and after difficult negotiations, during which an attempt was made on his life, he succeeded on Jan 17, 1919 in forming a coalition ministry, of which he became prime minister as well as minister of foreign affairs He obtained for Poland official recognition by the various Powers, and thus regularised her international position He suppressed the various military groups which hindered national unity, and at the first meeting of the Diet demanded and obtained the formation of a national army. He went to Paris on April 6, 1919 as Poland's first delegate to the Peace Conference On two different occasions, the Diet renewed its vote of confidence in him and expressed the gratitude of his country But as it was impossible for him to make a national union a reality, and, above all, to conclude peace with the Soviet government, in view of the violent opposition of the military party, he resigned office (Nov. 27, 1919). He continued however to defend Poland's interests at the Conference of Ambassadors and the League of Nations In July 1920 he protested against Czechoslovak action in regard to Teschen.

He abandoned his political career in Feb. 1921, and retired to his Californian estate, returning afterwards to resume his musical career.

See Robert Lansing, *The Big Four and Others of the Peace Conference* (1921); Eugene S Bagger, *Eminent Europeans* (1922); Frank W. Davis, *Time Exposures* (1926).

PADIHAM, urban district, Clitheroe parliamentary division, Lancashire, England, 3 m. W. of Burnley by L M S. railway. Pop (1921) 12,471. It stands on the river Calder. Its industries comprise cotton mills, quarries and coal mines The church of St Leonard (15th cent) was rebuilt in the Perpendicular style (1866–8) In 1251 Padiham was the manor of Edmund de Lacy.

PADILLA, JUAN LOPEZ DE, insurrectionary leader in the "*guerra de las comunidades*," in which the commons of Castile made a futile stand against the arbitrary policy of Charles V. and his Flemish ministers, eldest son of the Comendador of Castile, he was born in Toledo towards the close of the 15th century. After the cities, by their deputies assembled at Avila, had vainly demanded the king's return, due regard for the rights of the cortes, and economical administration, to be entrusted to the Spaniards, they resolved to resort to force, and the "holy junta" was formed, with Padilla at its head They captured Tordesillas, and sought to establish a national Government in the name of the imbecile Joanna. Tordesillas was recaptured by the nobles, and Padilla took Torrelobaton and other towns, but his army was completely routed at Villalar (April 23, 1521), Padilla being made prisoner and executed on the following day. His wife, Maria Pacheco de Padilla, defended Toledo against the royal troops for six months afterwards, but ultimately had to flee to Portugal.

See Sandoval, *Historia de Carlos V.* (Pamplona, 1681); E. Armstrong, *The Emperor Charles V* (1902); A. Rodriguez Villa, *Juana la Loca* (Madrid, 1892), Pero Mejía, *Comunidades de Castilla* (Bib de Autores Esp, xxi).

PADISHAH, the Turkish form of the Persian *padshah,* a title—equivalent to "lord king"—of the reigning sovereign In Europe it was applied to the sultan of Turkey The Persian *padshah* is from *pati,* lord, master, and *shah,* king

PADSTOW, a small seaport and market town in the St Austell parliamentary division of Cornwall, England, on a branch of the S R Pop of urban district (1921) 1,736 Padstow (Aldestowe 1,273, Patrikstowe 1,326, Patrestowe 1,346) and St. Ives are the only two tolerably safe harbours on the north coast of Cornwall To this circumstance they both owed their selection for early settlement and the Padstow region (especially Harlyn Bay) is full of prehistoric associations St Petrock, called the patron saint of Cornwall, is said to have landed here and also to have died here in the 6th century Padstow is not mentioned in the Domesday Survey It was included in the bishop of Exeter's manor of Pawton, annexed to the see of Crediton Until the Danes plundered Padstow (981), it is said to have possessed a monastery, which thereupon was transferred to Bodmin Two manors of Padstow are mentioned later—the prior of Bodmin's manor, including the rectory, and a manor which passed from the Bonvilles to the Greys, marquesses of Dorset, both were eventually acquired by the family of Prideaux Padstow appears to have been a port of considerable repute in the 14th century In 1580 Norden describes it as an incorporation and market town Carew in 1602 states that it had lately purchased a corporation and derived great profit from its trade with Ireland No traces of a charter have been found A prescriptive market is held on Saturdays, two fairs of like nature have disappeared It lies near the north coast, on the west shore, and 2 m from the mouth of the estuary of the river Camel The church of St Petrock, with a massive roodstone in the churchyard, is mainly Perpendicular, with an Early English tower Within are an ancient font, a canopied piscina and a timber roof over the nave and aisles The church of St Enodock, erected in the 15th century amid dunes bordering the east shore of the estuary, in place of a more ancient oratory, was long buried beneath drifts of sand, and from a little distance only the spire can be seen A Norman font remains from the older foundation A monastery formerly standing on the high ground west of Padstow was founded by St Petrock in the 6th and razed by the Danes in the 10th century. Pentine Point shelters Padstow bay on the north-east, but the approach to the estuary is dangerous during northwesterly gales. Padstow is a harbour of refuge, although the river channel is narrow and much silted Dredging is carried on and the sand, which is rich in carbonate of lime is used as manure The Padstow Harbour association (1829) is devoted to the rescue of ships in distress, making no claims for salvage beyond the sums necessary for its maintenance Padstow has fisheries and shipyards and some agricultural trade It imports coal, iron and timber for slates and kaolin.

PADUA, a city of northern Italy (Lat *Patavium* [*q v*]; Ital. *Padova*), on the river Bacchiglione, 25 m W of Venice and 18 m S E of Vicenza Pop. (1921) 88,443 (town), 112,021 (commune) The city is picturesque, with arcaded streets, and many bridges crossing the various branches of the Bacchiglione, which once surrounded the ancient walls The Palazzo della Ragione (1218–9) has a great hall on the upper floor; its length is 267½ ft, its breadth 89 ft, and its height 78 ft; the walls are covered with symbolical paintings in fresco, originally by Giotto; the building stands upon arches, and the upper storey is surrounded by an open loggia In 1306 Fra Giovanni, an

Augustinian friar, covered the whole with one roof curved like the hull of a ship; originally there were three roofs, spanning the three chambers into which the hall was at first divided; the internal partition walls remained till the fire of 1420, when the Venetian architects who undertook the restoration removed them. In the Piazza dei Signori, now called Unità d'Italia, is the beautiful loggia called the Gran Guardia (1493–1526) and close by is the Palazzo del Capitanio, the residence of the Venetian governors, with its great door, the work of Falconetto of Verona, 1532.

The most famous of the Paduan churches is the basilica dedicated to Saint Anthony, commonly called Il Santo; the bones of the saint rest in a chapel richly ornamented with carved marbles, the work of various artists, among them of Sansovino and Falconetto; the basilica was begun after his death in 1231 and completed in the following century; it is covered by seven cupolas. In the piazza in front of the church is Donatello's magnificent equestrian statue of Erasmo da Narni, the Venetian general (d. 1443). The Eremitani is an Augustinian church of the 13th century, containing the tombs of Jacopo (1350) and Ubertino (1345) da Carrara, lords of Padua, and the chapel of SS. James and Christopher, with Mantegna's frescoes. Close by the Eremitani is the small church of the Annunziata, known as the Madonna dell' Arena; the interior is entirely covered with paintings by Giotto. Padua has long been famous for its university, founded in 1222. Among the professors and alumni were Bembo, Sperone Speroni, Veselius, Acquapendente, Galileo, Pomponazzi, Pole, Scaliger, Tasso and Sobieski. In 1925–6 it had 2,439 students. The presence of the university attracted many distinguished artists, as Giotto, Lippo Lippi and Donatello; and for native art there was the school of Squarcione (1394–1474), whence issued the great Mantegna (1431–1506). There is an important picture gallery. The botanical garden (1545) is the oldest in Europe. Corn and saw mills, distilleries, chemical factories, breweries, candle-works, ink-works, foundries, agricultural machine and automobile works flourish.

At the Diet of Aix-la-Chapelle (828) the duchy and march of Friuli, in which Padua lay, was divided into four counties, one of which took its title from that city. At the beginning of the 11th century the citizens established a constitution, composed of a general council or legislative assembly and a credenza or executive; and during the next century they were engaged in wars with Venice and Vicenza for the right of water-way on the Bacchiglione and the Brenta—so that, on the one hand, the city grew in power and self-reliance, while, on the other, the great families of Camposampiero, D'Este and Da Romano began to emerge and to divide the Paduan district between them. The citizens, in order to protect their liberties, were obliged to elect a podestà, and their choice fell first on one of the D'Este family (*c.* 1175); but in 1237 Frederick II. established his vicar Ezzelino da Romano in Padua and the neighbouring cities.

When Ezzelino met his death, in 1256, Padua enjoyed a brief period of rest and prosperity: the university flourished; the basilica of the saint was begun; the Paduans became masters of Vicenza. But this advance brought them into dangerous proximity to Can Grande della Scala, lord of Verona, to whom they had to yield in 1311. As a reward for freeing the city from the Scalas, Jacopo da Carrara was elected lord of Padua in 1318. From that date till 1405, with the exception of two years (1388–1390) when Gian Galeazzo Visconti held the town, nine members of the Carrara family succeeded one another as lords of the city.

Padua passed under Venetian rule in 1405, and so remained, with a brief interval during the wars of the League of Cambray, till the fall of the republic in 1797. The city was governed by two Venetian nobles, a podestà for civil and a captain for military affairs; each of these was elected for sixteen months. Under these governors the great and small councils continued to discharge municipal business and to administer the Paduan statutes of 1276 and 1362. For history after 1797 *see* VENICE.

See G. Verci, *Storia della Marca Trevigiana* (Venice, 1786); Abate G. Gennari, *Annali di Padova* (Padua); G. Cittadella, *Storia della dominazione carrarese* (Padua, 1842); B. Gonzati, *La Basilica di Sant' Antonio di Padova* (Padua, 1853).

PADUCAH, a city of south-western Kentucky, U.S.A., on the Ohio river at the mouth of the Tennessee; a port of entry and the county seat of McCracken county. It is on Federal highways 45, 60 and 68, and is served by the Burlington Route, the Gulf, Mobile and Northern, the Illinois Central, the Nashville, Chattanooga and St. Louis and the Paducah and Illinois railways, and river steamers. Pop. 24,735 in 1920 (23% negroes); estimated locally at 37,500 in 1928. It is one of the principal dark-tobacco markets in the country, and ships also large quantities of corn, pork, fruits, vegetables, iron ore, lumber and cross-ties. It has railroad repair shops and various other manufacturing industries, with an output in 1925 valued at $13,054,801. Paducah was settled in 1821, laid out in 1827 by Gen. William Clark, incorporated as a town in 1830, and chartered as a city in 1856. It was named after an Indian chief. On Sept. 5, 1861, the city was occupied by Gen. Grant. It was raided on March 25, 1864, by Gen. Nathan B. Forrest, but he was unable to take the fortifications.

PAEAN (Gr. Παιάν, epic Παιήων), in Homer (*Il.* v. 401, 899), the physician of the gods. It is not known whether he was originally a separate deity or merely an aspect of Apollo. Homer leaves the question unanswered; Hesiod (*cf.* schol. Hom. *Od.* iv. 432) definitely separates the two, and in later poetry Paean is invoked independently as a health god. It is equally difficult to discover the relation between *Paean* or *Paeon* in the sense of "healer" and paean in the sense of song. Farnell refers to the ancient association between the healing craft and the singing of spells, and says that it is impossible to decide which is the original sense. Such songs were originally addressed to Apollo, and afterwards to other gods, Dionysus, Helios, Asclepius. It was the custom for a paean to be sung by an army on the march and before entering into battle, when a fleet left the harbour, and also after a victory had been won; this is already found in Homer, *Iliad*, xxii., 391. Paeans were sung at the festivals of Apollo (especially the Hyacinthia), at banquets, and later even at public funerals. Later, especially in Hellenistic times (first by the Samians to Lysander) they are addressed to more or less deified men. The word "paean" is now used of any song of joy or triumph.

See L. R. Farnell, *Cults of the Greek States* (1896); A. Fairbanks, "A Study of the Greek Paean," No. xii. of *Cornell Studies in Classical Philology* (New York, 1900); BACCHYLIDES and PINDAR.

PAEDOGENESIS, the term used in biology to denote the phenomenon of sexual maturity in a technically immature organism (larva). It occurs in the Ctenophora (*q.v.*) Diptera (*q.v.*) and other groups. (*See* METAMORPHOSIS.)

PAELIGNI, a people of ancient Italy, first mentioned as a member of a confederacy which included the Marsi, Marrucini, and Vestini (qq.v.), with which the Romans came into conflict in the second Samnite War, 325 B.C. (Liv. viii. 29) On the submission of the Samnites (q.v.) they all came into alliance with Rome in 305–02 B.C. (Liv. ix. 45, x. 3, and Diod. xx 101). Each of them was an independent unit. Thus the Vestini issued coins in the 3rd century; each of them appears in the list of the allies in the Social War (Appian, *B.C.*, i. 39). The mountain fortress of Corfinium was chosen as the rebel capital. It was renamed Vitellio, the Oscan form of Italia, a name which appears, written in Oscan alphabet, on the coins struck there in 90 B.C.

The inscriptions show that the dialect spoken by these tribes was substantially the same from the northern boundary of the Frentani to some place in the upper Aternus valley not far from Amiternum (mod. Aquila). This dialect closely resembled the Oscan of Lucania and Samnium, though presenting some peculiarities of its own, which warrant, perhaps, the use of the name North Oscan. The clearest of these is the use of postpositions, as in Vestine *Poimunie-n*, "in templo Pomonali"; *pritrom-e, i.e., in proximum*, "on to what lies before you." Others are the sibilation of consonantal *i* and the assimilation of *-di-* to some sound like that of English *j* (denoted by Ꟈ in the local variety of Latin alphabet), as in *vidadu*, "viamdō," *i.e.*, "ad-viam"; *Musesa*=Lat. *Mussedia;* and the loss of *d* (in pronunciation) in the ablative, as in *aetatu firata fertlid* (*i.e., aetate fertili finita*), where the contrast of the last with the other two forms shows that the *-d* was an archaism still occasionally used in writing.

The name *Paeligni* may belong to the NO-class of Ethnica (*see* SABINI), but the difference that it has no vowel before the suffix suggests that it may rather be parallel with the suffix of Lat. *privignus*. If it has any connection with Lat. *paelex*, "concubine," it is conceivable that it meant "half-breeds," and was coined in contempt by the conquering Sabines, who turned the *touta Marouca* into the community of the *Marrucini* (q.v.). For the history of the Paeligni after 90 B.C. *see* the references given in *C. I. L.*, ix. 290 and 296. None of the Latin inscriptions of the district need be older than Sulla, but some of them both in language and script show the style of his period (*e.g.*, 3087, 3137); and, on the other hand, as several of the native inscriptions, which are all in the Latin alphabet, show the normal letters of the Ciceronian period, there is little doubt that the Paelignian dialect lasted down to the middle of the 1st century B.C.

Paelignian and this group of inscriptions generally form a most important link in the chain of the Italic dialects, as without them the transition from Oscan to Umbrian would be completely lost. The unique collection of inscriptions and antiquities of Pentima and the museum at Sulmona were both created by the late Professor Antonio de Nino, who rescued every Paelignian monument that we possess.

For further details and the text of the inscriptions, the place-names, etc., *see* R. S. Conway, *The Italic Dialects*, pp. 235 et seq., and the earlier authorities there cited.

PAEONIA, the land of the Paeonians, the boundaries of which, like the early history of its inhabitants, are very obscure. The Paeonians are regarded as descendants of the Phrygians of Asia Minor. According to the national legend they were colonists from Troy, and Homer (*Iliad*, ii. 848) speaks of Paeonians from the Axius fighting on the side of their Trojan kinsmen. Before the reign of Darius Hystaspes, they had made their way as far east as Perinthus. When Xerxes crossed Chalcidicē on his way to Therma (Thessalonica) he is said to have marched "through Paeonian territory." They occupied the entire valley of the Axius as far inland as Stobi, and the valleys to the east of it as far as the Strymon. In consequence of the growth of Macedonian power their territory was considerably diminished, and in historical times was limited to the north of Macedonia from Illyria to the Strymon. The Paeonians included several independent tribes, later united under a single king. They adopted the cult of Dionysus, known amongst them as Dyalus or Dryalus, and Herodotus (iv. 33) mentions that the Thracian and Paeonian women offered sacrifice to Queen Artemis (probably Bendis). They worshipped the sun in the form of a small round disc fixed on the top of a pole. They drank barley beer and various decoctions made from plants and herbs. The country was rich in gold and a bituminous kind of wood. The women were famous for their industry. Herodotus (v. 12) tells the story that Darius, having seen at Sardis a beautiful Paeonian woman carrying a pitcher on her head, leading a horse to drink, and spinning flax, all at the same time, enquired who she was. Having been informed that she was a Paeonian, he sent instructions to Megabyzus, commander in Thrace, to deport two tribes of the nation without delay to Asia. At the time of the Persian invasion the Paeonians on the lower Strymon had lost, while those in the north maintained their independence. They frequently made inroads into Macedonian territory until they were finally subdued by Philip, who permitted them to retain their government by kings. The daughter of Audoleon, one of these kings, was the wife of Pyrrhus, king of Epirus, and Alexander the Great wished to bestow the hand of his sister Cynane upon Langarus who had shown himself loyal to Philip. In 280 the Gallic invaders under Brennus ravaged the land of the Paeonians. After the Roman conquest, Paeonia east and west of the Axius formed the second and third districts respectively of Macedonia. Under Diocletian Paeonia and Pelagonia formed a province called Macedonia *secunda* or *salutaris*, belonging to the prefecture of Illyricum.

See W. Tomaschek, "Die alten Thraker," in *Sitzungsberichte der k. Akad. der Wissenschaften*, xxviii. (Vienna, 1893). (*See* MACEDONIA.)

PAEONIUS, of Mende in Thrace, a Greek sculptor of the latter part of the 5th century. The statement of Pausanias that he executed one of the pediments of the temple of Zeus at Olympia, is doubtful. But we possess an important work of Paeonius in the Victory found in the German excavations at Olympia, and probably set up in memory of the battle of Sphacteria, 424 B.C. It bears the inscription "Dedicated to Olympian Zeus by the Messenians and Naupactians as a tithe of the spoil of their enemies. Paeonius of Mende made the statue, and was a successful competitor in the construction of the gable-figures for the temple." The last phrase may be responsible by a confusion for the attribution to him of the pediment.

See E. A. Gardner, *Handbook of Greek Sculpture* (1915).

PAEONY (*Paeonia*), a genus of plants remarkable for their large and gorgeous flowers; it belongs to the family Ranunculaceae. There are two distinct sets, one the strong-growing herbaceous kind, with fleshy roots and annual stems, derived mainly from *Paeonia albiflora* and *P. officinalis;* the other called the tree paeony, stiff-growing plants with half-woody permanent stems, which have sprung from the Chinese *P. Moutan.*

The herbaceous paeonies usually grow from 2 to 3 ft. in height, and have large much-divided leaves, and ample flowers of varied and attractive colours, and of a globular form in the double varieties which are those most prized in gardens. They usually blossom in May and June, and as ornaments for large beds in pleasure grounds, and for the front parts of shrubberies, few flowers equal them in gorgeous effect. A good moist loamy soil suits them best, and a moderate supply of manure is beneficial.

The garden varieties of modern times are very beautiful, the flowers being in many instances delicately tinted with more than one colour, such as buff with bronzy centre, carmine with yellowish centre, rose with orange centre, white tinted with rose, etc.

The moutans or tree paeonies are remarkable for their sub-shrubby habit, forming vigorous plants sometimes attaining a height of 6 to 8 ft., and producing in May magnificent flowers which vary in colour from white to lilac, purple magenta, violet and rose. These are produced on the young shoots, which naturally bud forth early in the spring, and are in consequence liable in bleak localities, unless protected, to be cut off by spring frosts. They require to be thoroughly ripened in summer, and therefore a hot season and a dryish situation are desirable for their well-being; and they require perfect rest during winter. They are increased by grafting in late summer or autumn on the roots of the herbaceous paeonies. There are hundreds of names given to the colour variations of both the herbaceous and tree paeonies.

In North America the genus is represented by a single species, the western paeony (*P. Brownii*), which grows on brushy slopes in the foothills and on mountains up to about 5,500 ft. altitude from southern California to Washington and eastward to Utah. It is a fleshy perennial, 8 in. to 15 in. high, with pale, smooth, ternately divided leaves, mostly clustered at the base of the stem The brownish-red flowers, about 1½ in. broad, are composed of 5 or 6 thick, leathery, flattish petals, which are but slightly longer than the roundish, concave sepals.

PAËR, FERDINANDO (1771–1839), Italian composer, was born at Parma on June 1, 1771. His first opera, *La Locanda de' vagebondi*, was published when he was only 16; and others rapidly followed. In 1797 he went to Vienna, where his wife, the singer Riccardi, had obtained an engagement at the opera; and here he produced another series of operas, including his *La Camilla ossia il Sotterraneo* (1799) and his *Achille* (1801). In 1803 he was appointed composer to the court theatre at Dresden. At Dresden he produced *Il Sargino* (1803) and *Leonora* (1804), based on the same story as Beethoven's *Fidelio*. In 1807 Napoleon saw him in Dresden, and took him with him to Warsaw and Paris at a salary of 28,000 francs. In 1812 he succeeded Spontini as conductor of the Italian opera in Paris, but in 1823 he retired in favour of Rossini. He died May 3, 1839. Paër wrote 43 operas.

PAESTUM, an ancient Greek city in Lucania (Gr. Ποσειδωνία; mod. Pesto), near the sea, with a railway station 24 m. S.E. of Salerno, 5 m. S. of the river Silarus (Salso), founded by Troezenian and Achaean colonists from Sybaris, probably about 600 B.C. for it was flourishing about 540 B.C., when the neighbouring city of Velia was founded. For many years the city maintained

its independence against the Lucanians but at last fell into their hands; and in 273 B.C. it came under Roman rule, the name being changed to Paestum. It successfully resisted the attacks of Hannibal. Under Augustus and Tiberius, the neighbourhood was healthy, highly cultivated, and celebrated for its flowers; the "twice blooming roses of Paestum" are mentioned by several Latin poets. Its present deserted and malarious state is due to the silting up of the mouth of the Silarus. In 871 Paestum was sacked and partly destroyed by Saracen invaders; in the 11th century it was further dismantled by Robert Guiscard, and in the 16th was finally deserted.

The ruins are among the most interesting and imposing of the Hellenic world. The earliest temple is the so-called Basilica. Terra cottas of the first quarter of the 6th cent. B.C. have been found, and also a fragment of a dedication to Poseidon, so that his name should be applied to this, and not to the great hexastyle temple. It is of unique plan, with nine columns in the front and eighteen at the sides, $4\frac{3}{4}$ ft. in diameter. A line of columns runs down the centre of the cella. The columns and the architraves upon them are well preserved, but there is nothing above the frieze existing, and the cella wall has entirely disappeared. Next in point of date comes the so-called temple of Ceres, a hexastyle peripteros (after 540 B.C.). The columns are all standing, and the west and part of the east pediment are still *in situ*. In front stood a sacrificial altar as long as the temple itself.

The temple hitherto attributed to Neptune, was built about 420 B.C. It is a hexastyle peripteros with fourteen columns on each side, and is remarkably well-preserved, both pediments and the epistyle at the sides being still *in situ*. The cella, the outer walls of which have to a great extent disappeared, has two internal rows of seven columns $4\frac{2}{3}$ ft. in diameter, upon which rests a simple epistyle, supporting a row of smaller columns, so that the interior of the cella was in two storeys.

The Temple of Peace (2nd cent. B.C.) was excavated in 1830, but is now covered up. Traces of a Roman theatre and other buildings, as well as of the main street (*cardo*) have also been found. The circuit of the town walls, well built of squared blocks of travertine, and 16 ft. thick, of the Greek period, is almost entire; they are about 3 m. in circumference, enclosing a roughly rectangular area. There were four gates, that on the east with a single arched opening being well-preserved. Outside the north gate is a street of tombs (the contents are in the Naples Museum). (T. A.)

PAEZ, JOSE ANTONIO (1790–1873), Venezuelan soldier and politician, was born in Aricagua near New Barcelona, on June 13, 1790, of Indian parents. After an adventuresome youth, in 1810 he joined the revolutionary movement against Spain, as leader of a band of mounted plainsmen. In numerous encounters with the Spaniards in the province of Apure (1816), in the defeat of Ortiz (1818), and in the victories of Carabobo (1821) and Puerto Cabello (1822), he showed himself an able leader, and was chiefly responsible for bringing Venezuela within Bolívar's republic of Great Colombia. In 1829 he headed the revolt in Venezuela against Bolívar, and was first president of the new republic, 1831–35. During his successor's term he crushed several rebellions, served as president, 1839–43, and was dictator in 1846. Heading a rebellion soon afterwards, he was defeated, imprisoned and exiled (1850), but after a short stay in Europe, returned in 1858 to head another revolutionary Government. In 1861 he was sent as ambassador to the United States, but was soon recalled to fill his third term as dictator-president. Unable to control the situation, he resigned peaceably in 1863, and retired first to Buenos Aires (1866) and then to the United States (1871), where he died in New York on May 7, 1873. While in New York, in 1867–69, he published an *Autobiografía*.

PAEZ, PEDRO (1564–1622), Jesuit missionary to Abyssinia, born at Olmedo in Old Castile in 1564, entered the Society of Jesus, and was sent to Goa in 1588. Within a year he and a fellow missionary were sent to Abyssinia to act as spiritual directors to the Portuguese residents. On his way he fell into the hands of pirates at Dhofar and was sent to Sanaa, capital of the Yemen, where he was detained for seven years by the pasha as a slave. Having been redeemed by his order in 1596, he spent some years in mission work on the west coast of India. In 1603 he again set out for Abyssinia, and landed at the port of Massawa. He was summoned to court, succeeded in vanquishing the native priests and in converting Za-Denghel, the negus, who wrote to the pope and the king of Spain for more missionaries, an act which led to war with the Abyssinian priests and cost him his life (Oct. 1604). Paez died of fever in 1622.

In addition to the translation of the Catechism, Paez is supposed to be the author of a treatise *De Abyssinorum erroribus* and a history of Ethiopia, ed. C. Beccari in *Rerum aethiopicarum scriptores occidentales inediti a saeculo XVI. ad XIX.* (1905).

See A. de Backer, *Bibliothèque de la Compagnie de Jésus* (ed. C. Sommervogel) vi. (1895); W. D. Cooley in *Bulletin de la société de géographie* (1872), 6th series, vol. iii.

PAGAN, a town and former capital, in Myingyan district, Burma, 92 m. S.W. of Mandalay. It was founded by King Pyinbya in 847, and remained the capital until the extinction of the dynasty in 1298. Pagan itself is now a mere village, but hundreds of pagodas in various stages of decay meet the eye in every direction. A number of them were built by King Anawrahta, who overcame the Peguan king, Manuha of Thaton. It was Anawra-hta who introduced the Buddhist religion in Upper Burma, and who carried off nearly the whole Thaton population to build the pagodas at Pagan like those of Thaton.

PAGAN, a heathen, one who worships a false god or false gods, or one who belongs to a race or nation which practises idolatrous rites and professes polytheism. In the early Christian Church *paganus* was applied to those who refused to believe in the one true God. It thus, of course, excluded Jews. In the middle ages, at the time of the crusades and later, "pagan" and "paynim" (O.Fr. *paenime*, Late Lat. *paganismus*, heathenism or heathen lands) were particularly applied to Mohammedans, and sometimes to Jews. It was in the rural districts that the old faiths lingered, and thus it is assumed that the Latin *paganus* (villager) arose after the establishment of Christianity, but Tertullian (*c.* 202, *De Corona Militis*, xi.), has a sentence suggesting that the "soldiers of Christ" dubbed the non-Christians *pagani*, referring to the raw, half-armed rustics.

See also Gibbon, *Decline and Fall of the Roman Empire* (ed. Bury, 1896), ch. xxi. note *ad fin.*

PAGANINI, NICOLO (1784–1840), Italian virtuoso on the violin, was born at Genoa on Feb. 18, 1784. His father Antonio, a clever amateur, who was in the shipping business, taught him the violin at a very early age, and he had further lessons from the *maestro di cappella* of the cathedral of San Lorenzo. He first appeared in public at Genoa in 1793, with triumphant success. He studied strenuously, practising single passages for ten hours at a time, and publishing compositions so difficult that he alone could play them. His first professional tour, through the cities of Lombardy, was made with his father in 1797. For some years he led a chequered career, and to pay his gambling debts had to pawn even his violin. A French merchant named Livron helped him out of his difficulties, however, and gave him a fine instrument, a Joseph Guarnerius, thenceforward his most treasured possession. Between 1801 and 1804 he lived in retirement, in Tuscany, with a noble lady who was in love with him. In 1805 he started on a tour through Europe, astonishing the world with his matchless performances, and especially with his unprecedented playing on the fourth string alone. In Venice, in 1815, after having been taken up by the Princess of Lucca and Piombo, Napoleon's sister, who made him her musical director, he began a *liaison* with Antonia Bianchi, a dancer, which lasted till 1828; and by her he had a son Achillino, born in 1826. Meanwhile the world rang with his fame. In 1827 the pope honoured him with the Order of the Golden Spur; and, in the following year, he extended his travels to Germany, beginning with Vienna, where he created a profound sensation. He first appeared in Paris in 1831; and on June 3 in that year he played in London at the King's Theatre. In 1832 he

returned to Italy, and bought a villa near Parma. In 1833 he spent the winter in Paris, and in 1834 Berlioz composed for him his symphony, *Harold en Italie*. In 1838 he suffered serious losses in Paris through the failure of the "Casino Paganini," a gambling-house which was refused a licence. The disasters of this year increased his malady—laryngeal phthisis—and he died at Nice on May 17, 1840. His will left a fortune of £80,000 to his son Achillino; and he bequeathed his Guarnerius to the municipality of Genoa, who preserve it as one of their dearest possessions.

There are numerous lives of Paganini; *see* the article and bibliography in *Grove's Dictionary of Music* also Fétis, *N. Paganini* (1851; Eng. trans. 1876); *Prod'homme and Paganini* (1907), in the series *Musiciens célèbres*.

PAGE, THOMAS NELSON (1853–1922), American author, was born at Oakland Plantation, Hanover county, Va., April 23, 1853, the great-grandson of Thomas Nelson (1738–89) and of John Page (1744–1808), both governors of Virginia, the former being a signer of the Declaration of Independence. After a course at Washington College (now Washington and Lee University) when Robert E. Lee was its president, he taught a year and in 1874 graduated in law at the University of Virginia. He practised, chiefly in Richmond, until 1893, when he removed to Washington, D.C., and devoted himself to writing and lecturing.

For his start in literature he was indebted to the dialect verse of Irwin Russell, contributing a poem of this sort to *Scribner's Monthly* (later the *Century Magazine*) in April, 1877, and publishing with A. C. Gordon a volume of such pieces entitled *Befo' de War* (1888). His first reputation was achieved, however, by "Marse Chan," which appeared in the *Century Magazine*. This and several other stories of the same type, some of them written for his first wife, Anne Bruce, were collected in what is probably Page's most characteristic book, *In Ole Virginia* (1887). Page, fortunate in having spent his formative years amid the glamorous life of the old régime and the tumults of the Civil War, is one of the writers who have done most to build up the romantic legends of the southern plantation. He is at his best when through negro characters and dialect he describes the life of the Virginia gentry. From 1913 to 1918 Page was ambassador to Italy. He died at Oakland, Va., on Nov. 1, 1922.

Page wrote several children's books, the best of which, *Two Little Confederates* (1888), has some autobiographic elements. His chief books of fiction are *Elsket and Other Stories* (1891); *Pastime Stories* (1894); *The Old Gentleman of the Black Stock* (1897); *Red Rock* (1898), a novel of the Reconstruction period; *Bred in the Bone* (1904); *Under the Crust* (1907); and *John Marvel, Assistant* (1909). His other writings are thoughtful and sincere. The principal ones are *The Old South* (1892), *The Negro; The Southerner's Problem* (1904), *The Old Dominion: Her Making and Her Manners* (1908), *Robert E. Lee, Man and Soldier* (1911), and *Italy and the World War* (1920). The Plantation edition of his *Novels, Stories, Sketches, and Poems* (12 vols.) appeared in 1906. See *Thomas Nelson Page, a Memoir of a Virginia Gentleman* (1923) by his brother, Rosewell Page; "Thomas Nelson Page" in *Virginian Portraits* by Armistead C. Gordon (Staunton, Va., 1924); and the commemorative tribute to Page prepared for the American Academy of Arts and Letters by Robert Underwood Johnson (1925).

PAGE, WALTER HINES (1855–1918), American writer and diplomatist, was born at Cary (N.C.), Aug. 15, 1855. His father, Allison Francis Page, was of English descent; his mother, Catherine Frances Raboteau, of Scottish and French Huguenot. At 16, in Jan. 1872, after a preparatory course at the Bingham military school at Mebane (N.C.), and a year at Trinity college, at Durham (N.C.), Page entered Randolph-Macon college at Ashland (Va.). The greatest and most lasting influence in his life at this time was Thomas Randolph Price. Prof. Price had two enthusiasms—English and Greek literature. He became deeply attached to Page, both as a boy and as a student, and obtained his appointment as one of the first 20 fellows of the new Johns Hopkins university at Baltimore. There under America's greatest classical scholar, Basil L. Gildersleeve, Page acquired a knowledge of antiquity and a feeling for Greek literature which influenced all his subsequent habits of thought as well as his own literary style. Page's health, always frail, caused him to leave Johns Hopkins without a degree. A winter (1878–79) spent in teaching

wanted an active life among men, and in 1880 he became editor of the St. Joseph *Gazette*. The Missouri town did not hold his interest long. He left in the summer of 1881 to make a tour of the southern states, writing a series of brilliant articles that were simultaneously printed in several leading American newspapers. The next two years Page spent as literary editor of the New York *World*, but in 1883 he resigned and returned to Raleigh (N.C.). For two years he edited the *State Chronicle*, a weekly newspaper, as distinguished for the vivacity of its editorial style as for the unconventionality of its opinions. Page ridiculed the tendency to regard a Confederate war record as almost the exclusive qualification for public office; he advocated primary education for both the white and the black, the development of scientific agriculture, the building of modern highways, and the creation of local industries. All these changes North Carolina has since introduced; the youthful Page, however, was ahead of his time, and after two rather tempestuous years, in which he found himself denounced as a "Southern Yankee," he had to confess failure, dispose of his paper and resume his life in New York.

His Literary Career.—Page's opportunity came in 1887, when he joined the staff of the *Forum*. In four years he transformed a bankrupt property into a profitable one and made it an influential organ of public discussion. He resigned his editorship in 1895 and entered the Boston publishing house of Houghton, Mifflin & Co. For two years he was literary adviser and associate editor of the *Atlantic Monthly*, and in 1898 became editor-in-chief. In 1899 he joined Frank N. Doubleday in establishing the publishing house of Doubleday, Page & Co. and founding the *World's Work* magazine, on which he served as editor from 1900 to 1913. Both in his writing and in his lectures, he continued to advocate his favourite causes. Of these the leading one was popular education, especially in the backward South. As a member, first of the Southern Education Board and afterwards of the General Education Board, he aided in distributing the Rockefeller millions for this purpose. By initiating the movement for the eradication of the hookworm, he started the work that has since taken shape in the International Health Board. He served on President Roosevelt's Country Life Commission, and was a leader in introducing Dr. Seaman A. Knapp's demonstration work in agricultural areas. All these years he closely followed political affairs, and in 1911 he was one of the first to proclaim the presidential qualifications of Woodrow Wilson. One of Wilson's first acts, after his inauguration, was to appoint Page ambassador to Great Britain.

Ambassador in London.—For his five years in London Page's life had been a preparation. His passion for democracy, his belief that British institutions and literature formed the most solid basis of civilization, his long advocacy of British-American co-operation as the most satisfactory method of solving world problems—all were put to the severest test in the arduous years of his ambassadorship. He had established familiar and congenial relations with the British public and British officialdom when the World War began. Up to that time Page had also worked in complete harmony with President Wilson. It was owing mainly to Page's prompting that President Wilson persuaded Congress to repeal the discriminating Panama tolls.

In the war Page, unlike Wilson at first, saw above all an attempt of Germany to grasp the hegemony of Europe and to substitute the Prussian conception of autocracy for the democratic ideal which he regarded as the true path of human progress. It was mainly this difference that caused the historic divergence between Page and Wilson. To the outside world Page maintained an attitude of strict neutrality; in his private communications to the President, however, he made no secret of his complete sympathy with the cause of the Allies and his general disagreement with the policy of the Administration. When the "Lusitania" was sunk, Page in his letters and cablegrams to Wilson strongly advocated an American declaration of war against Germany. He insisted then, as he did afterwards, that American intervention at that time would have brought the war to an early end with an Allied triumph. Page's great moment came on April 2, 1917, when

state of war with Germany, and used arguments that Page had been forcing on his attention for two and a half years.

Page had never been in robust health; and the anxieties and labours of a terrible period gradually exhausted him. He had meditated resignation many times, and consented to remain only at the earnest request of President Wilson. In Aug. 1918, however, he became so ill that the President acquiesced in his retirement. In early October he sailed on the "Olympic" and reached New York so weak that it was necessary to carry him from the ship. His one wish was to return to "the sand hills" of his early home in North Carolina. There he died on Dec. 21, 1918.

BIBLIOGRAPHY.—The chief authority on Page's career is B. J. Hendrick, *The Life and Letters of Walter H. Page* (2 vol., 1922; 3rd vol., 1925). *The intimate papers of Colonel House* (2 vol, 1926) and *The Training of an American: The Earlier Life and Letters of Walter H. Page, 1855–1913* (1928); Viscount Grey, of Fallodon, *Twenty-Five Years* (2 vol., 1925) are also valuable. *The Rebuilding of Old Commonwealths* (1902) gives in eloquent language Page's aspirations for the revitalization of the southern states. *A Publisher's Confession* (1905) gives his creed for his trade. In 1909 Page also published under the name of "Nicholas Worth" *The Southerner*, a semi-autobiographical novel interpreting his ideas on the South. Page's literary fame will rest on his letters. (B. J. H.)

PAGE, WILLIAM (1811–1885), American artist, was born at Albany (N.Y.), on Jan. 3, 1811. He studied for the ministry at the Andover Theological Seminary in 1828–30, and in later life became a Swedenborgian. He received his training in art from S. F. B. Morse and in the schools of the National Academy of Design, and in 1836 became a National Academician. From 1849 to 1860 he lived in Rome, where he painted portraits of his friends Robert and Elizabeth Browning. He died at Tottenville, Staten Island (N.Y.), on Oct. 1, 1885.

PAGE, a term used of a boy or young male person in various capacities, positions or offices. The etymology is doubtful. (*See* KNIGHTHOOD AND CHIVALRY and VALET.)

PAGEANT, a show or spectacle. In the mediaeval drama the word was used in the sense of a scene, a division or part of a play. Thus we read of Queen Margaret in 1457 that at Coventry she saw "alle the pagentes pleyde save domesday which myght not be pleyde for lak of day," and in the accounts of the Smiths' gild at Coventry for 1450, five pence is paid "to bring the pagent into gosford-stret." A clear idea of what these stages were like when the mystery plays became processional (*processus*) that is, were acted on separate platforms moving along a street is seen in Archdeacon Roger's contemporary account of the Chester plays about the end of the 16th century. "The mane of these playes weare, every company had his pagiant, or parte which pageants weare a high scafolde with 2 rowmes, a higher and a lower, upon 4 wheeles" T. Sharp, *Dissertation on the Pageants or Mysteries at Coventry*, 1825, which contains most of the early references.

Production.—Pageant production as differentiated from play production offers the problem of outdoor distances, sunlight and shadow on colour, and the timing and marshalling of large numbers of people. Such problems should be given usually into the hands of an experienced director. Often, however, they are turned over to a committee of capable townsfolk.

The site should preferably be a natural amphitheatre, bordering if possible, on a lake or river. The ground should be gone over for its acoustics, a forest background being an asset Other considerations are accessibility by train, tram and motor, room for parking space, a relative area of open space for stage and audience, practical entrances and exits, beauty of landscape, and room behind the outdoor stage for dressing tents and gathering places for players. An ideal site has the sun in back of the audience and a prevailing wind to blow from players to spectators, thus carrying words toward the hearers.

Administrative details are usually in the hands of a group of representative citizens. The actual labour, making of costumes and properties, gathering of antiques, is all done by the townsfolk. An even distribution of work and a competent executive are necessary. Often a historic pageant is accompanied by a loan exhibition of old costumes, relics, historic furniture, books, maps, household possessions and everything pertaining to the past and present of the community.

The singing should be done by citizens, though band or orchestra may be imported. The latter, for outdoor acoustics, should be sizable. The former needs the addition of stringed instruments for softer effects. All possible effects of light, colour, movement and sound should be synchronized and used to their utmost. A liberal time for writing and planning, an abundance of group rehearsals and three complete rehearsals should make an artistic and successful pageant.

THE PAGEANT IN ENGLAND

The 20th century has seen in England what may in some respects be looked on as a revival but in general as a new departure in the shape of semi-dramatic spectacles illustrative of the history of a town or locality; to such spectacles the name of "Pageant" has been appropriately given. Coventry in its procession in commemoration of Lady Godiva's traditional exploit, has since 1678 illustrated an incident in the history of the town. A pageant consists of a series of scenes, representing historical events directly connected with the town or locality in which the pageant takes place. These are accompanied by appropriate dialogue, speeches, songs, etc., and with music and dances. The effect is naturally much heightened by the place of the performance, more particularly if this is the actual site of some of the scenes depicted, as at the Winchester pageant (1908) where the background was formed by the ruins of Wolvesey castle. The Sherborne pageant of 1905 was the first of the series of pageants. In 1907 and 1908 they became very numerous; of these the principal may be mentioned, those at Oxford, Bury St. Edmunds in 1907; at Winchester, Chelsea, Dover and Pevensey in 1908; and that of the English Church at Fulham palace 1909.

The artistic success of a pageant depends on the beauty or historic interest of its site, the skilful choice of episodes and dramatic incidents, the grouping and massing of colour, and the appropriateness of the dialogue, speeches and incidental music. It is here that the skill and talent of the writer, designer or director of the pageant find scope. The name of Louis N. Parker (b. 1852), the author of the Sherborne pageant, the earliest and one of the most successful, must always be associated with the movement, of which he was the originator. (X.)

THE PAGEANT IN AMERICA

History.—Pageantry in America began in 1905 with Percy MacKaye's pageant in honour of Augustus Saint-Gaudens, at Cornish, New Hampshire. Within three years the Educational pageant at the Boston Normal school, the Philadelphia pageant in honour of the 250th anniversary of the founding of the city, and the superb Quebec pageant followed.

Five well-known and typical pageants may be mentioned. The Hudson-Fulton celebration in New York was a processional pageant of vast dimensions. For imaginative quality Percy MacKaye's "Caliban," produced in New York, and later in Boston, to honour the Shakespeare tercentenary, should be cited (though the author wishes this example of his work to be termed a "community masque") and for even greater poetic beauty the same writer's St. Louis masque. This last preluded the historical scenes of the St. Louis pageant, written by Thomas Wood Stevens.

"The Pilgrim Spirit" written and produced at Plymouth, Mass., by George Pierce Baker for the Pilgrim tercentenary, was marked by historic accuracy and fine dramatic quality. The Yale pageant, written by a large group of Yale graduates, has naturally a diversity of treatment in its various episodes, but also poetic prologues of high order. The Lexington pageant, by Sidney Howard, is distinguished by its somewhat expressionistic ending, which endeavours to state the significance of democracy.

Forms.—Pageantry has taken two forms. One is the strictly historic as given in the frontier States. These productions deal with pioneering, Indian fights, the gold rush, the cattle industry and agricultural developments. The other is the processional

type, usually a flower festival. The more famous of these are given annually in California and Oregon. Throughout the Southern States, also, are flower and fruit festivals and the justly celebrated Mardi Gras celebration in New Orleans.

The States along the Atlantic seaboard, especially as one moves northward to Pennsylvania, New York and the New England group, use the historical type freely.

Religious pageantry has kept step with civic. The three salient examples are "The Pageant of Darkness and Light," by John Oxenham; "The Wayfarer," by J. E. Crowther, and "Faith of Our Fathers," by Anita Ferris.

PAGET, SIR JAMES, BART. (1814–1899), British surgeon, was born at Yarmouth on Jan. 11, 1814, the son of a brewer and shipowner. His brother, Sir George, became regius professor of physic at Cambridge and also had a distinguished medical career. After attending school at Yarmouth, James was apprenticed to a general practitioner until 1834 when he entered St. Bartholomew's Hospital, London. It was during his first winter session that he detected *Trichina spiralis,* a minute parasite infecting the human muscles. R. Owen (*q.v.*), who gave these parasites their scientific name, is usually credited with the discovery, but he merely confirmed what Paget had detected. From May 1836, Paget experienced a period of severe poverty, being too poor to secure a house-surgeoncy or even a dressership. However, in 1841 he was made surgeon to the Finsbury Dispensary, and in 1843 lecturer on general anatomy and physiology at St. Bartholomew's. Four years later, he was appointed assistant surgeon, and also Arris and Gale professor at the College of Surgeons. The lectures given under this professorship were published in 1853 as *Lectures on Surgical Pathology.* By 1851 when he was elected F.R.S. Paget had become known as a great physiologist and pathologist. His lectures on physiology were a turning point in the fortunes of St. Bartholomew's school. In pathology, he was Hunter's real successor, and together with his friend, Virchow (*q.v.*), may truly be called the founder of the modern science.

In 1851 Paget began practice near Cavendish square, London. Seven years later he was appointed surgeon extraordinary to Queen Victoria, and in 1863 surgeon in ordinary to the prince of Wales. He specialized on the pathology of tumours and diseases of the bones and joints, and was the first to urge enucleation of the tumour, instead of amputation, in diseases of myeloid sarcoma. He gave original accounts of eczema of the nipple, mammary cancer, and osteitis deformans. In 1871 he resigned his surgeoncy to the hospital and received a baronetcy. In 1875 he was president of the Royal College of Surgeons, in 1877 Hunterian orator and in 1881 president of the International Medical Congress, and in 1883 became vice-chancellor of the University of London He died in London on Dec. 30, 1899.

See *Selected Essays and Addresses by Sir James Paget,* ed. by his son, S. Paget (London, 1902), who has also written *Memoirs and Letters of Sir James Paget* (3rd ed. London, 1903).

PAGET, VIOLET: *see* LEE, VERNON.

PAGET OF BEAUDESERT, WILLIAM PAGET, 1ST BARON (1506–1563), English statesman, was born in London in 1506, and was educated at St. Paul's School, at Trinity Hall, Cambridge, and at the university of Paris. He was employed by Henry VIII. in several important diplomatic missions; in 1532 he was appointed clerk of the privy council. He became secretary to Queen Anne of Cleves in 1539, and in 1543 he was sworn of the privy council and appointed secretary of state. Paget supported Somerset during the minority of Edward VI. In 1547 he was made comptroller of the king's household, chancellor of the duchy of Lancaster, and a knight of the Garter; and in 1549 he was made Baron Paget de Beaudesert. About the same time he obtained grants of lands, including Cannock Chase and Burton Abbey in Staffordshire, and the residence of the bishops of Exeter in London. He also obtained Beaudesert in Staffordshire. Paget shared Somerset's disgrace, being committed to the Tower in 1551 and degraded from the Order of the Garter in 1552. He was, however, restored to the king's favour in 1553, and was one of the twenty-six peers who signed Edward's settlement of the crown on Lady Jane Grey in June. He made his peace with Queen Mary, who reinstated him as a knight of the Garter and in the privy council in 1553, and appointed him lord privy seal in 1556. On the accession of Elizabeth in 1558 Paget retired from public life, and died on June 9. 1563.

PAGODA, a term loosely used for any eastern temple; but more commonly restricted to the pyramidal, conical or turret-shaped buildings of India, Java and the Malay peninsula, which are more accurately known as stupas, and reserved in China and Japan for square, polygonal or circular towers of many storeys. The word was first used in the 16th century by the Portuguese in India, and is a corruption of a native word, either Pers. *but. Kadah,* a house for an idol, or Sansk. *bhagavat,* divine. Chinese and Japanese pagodas usually possess a projecting roof at each floor level and each storey is sometimes slightly smaller than the one below, so that the outline appears to taper.

Pagoda, or pagod, is also the name given to a gold coin current in southern India; *Plumeria acutifolia,* a tree indigenous to India and bearing yellow and white flowers, is known as the pagoda tree

PAGSANJAN, a municipality (with administration centre and 13 *barrios* or districts) in the eastern part of the province of La Laguna, Luzon, Philippine islands, at the junction of the Pagsanjan and Botocan rivers and quite near the Laguna de Bay. Pop. (1918) 7,538. Here is located the Pagsanjan cataract or Botocan falls, some 200 ft. high—one of the largest waterfalls in the Philippines. The district produces coco-nuts and Pagsanjan in an important market place. In 1918, it had 33 manufacturing establishments with output valued at 444,000 pesos, and 76 household industry establishments with output valued at 35,000 pesos The language spoken is Tagalog.

PAHARI LANGUAGE (properly Pahāṛī, the language of the mountains), a general name applied to the Indo-Aryan languages or dialects spoken in the lower ranges of the Himalayas from Nepal in the east, to Chamba of the Punjab in the west. These forms of speech fall into three groups—an eastern, consisting of the various dialects of Khas-kurā, the language of Nepal; a central, spoken in the north of the United Provinces, in Kumaon and Garhwal; and a western, spoken in the country round Simla and in Chamba. In Nepal, Khas-kurā is the language only of the Aryan population, the mother tongue of most of the inhabitants being some form or other of Tibeto-Burman speech. Khas-kurā is mainly differentiated from Central Pahari through its being affected by Tibeto-Burman idioms. Central and Western Pahari have not been brought into close association with Tibeto-Burmans; their language is therefore purely Aryan

Khas-kurā, as its speakers themselves call it, passes under various names. The English term Nēpālī or Naipālī (*i.e.,* the language of Nepal) is a misnomer, for it is not the principal form of speech used in that country, viz., the Tibeto-Burman Nēwārī. Khas-kurā is also called Gōrkhālī, or the language of the Gurkhas, and Pahāṛī or Parbatiyā, the language of the mountains.

Central Pahari includes two dialects:—Garhwālī, spoken mainly in Garhwal and the country round the hill station of Mussoorie, and Kumaunī. spoken in Kumaun, including the country round the hill station of Naini Tal.

Western Pahari includes a great number of dialects. In the Simla Hill States alone no less than twenty-two, of which the most important are Sirmaurī and Keonthalī (the dialect of Simla itself), were recorded. To these may be added Jaunsārī, spoken in the Jaunsar tract of Dehra Dun; Chambiālī and Churāhī, of the state of Chamba; Mandeālī of the state of Mandī; Gādī of Chamba and Kangra; Kuluhī of Kulu, and others.

But the Aryan language of the whole Pahari area is now a form of Rajasthani, exhibiting at the same time traces of the old Khaśa language which it superseded, and also in Nepal of the Tibeto-Burman forms of speech by which it is surrounded.

Khas-kura shows most traces of Tibeto-Burman influence. The gender of nouns is purely sexual, and, although there is an oblique case derived from Rajasthani. it is so often confounded with the nominative, that in the singular number either can be employed

for the other. Both these are due to Tibeto-Burman influence, but the non-Aryan idiom is most prominent in the use of the verb. There is an indefinite tense referring to present, past or future time according to the context, formed by suffixing the verb substantive to the root of the main verb, exactly as in some of the neighbouring Tibeto-Burman languages.

In Eastern and Central Pahari the verb substantive is formed from the root *ach*, as in both Rajasthani and Kashmiri. In Rajasthani its present tense, being derived from the Sanskrit present *ṛcchāmi*, I go, does not change for gender. But in Pahari and Kashmiri it is a participial tense and does change according to the gender of the subject.

Here we have a relic of the old Khaśa language, which seems to have been related to Kashmiri. Other relics of Khaśa are the tendency to shorten long vowels, the practice of epenthesis, or the modification of a vowel by the one which follows in the next syllable, and the frequent occurrence of disaspiration. (*See* INDO-ARYAN LANGUAGES.)

BIBLIOGRAPHY.—S. H. Kellog's *Hindi Grammar* (2nd ed., London, 1893) includes both Eastern and Central Pahari in its survey. For Khas *see* also A. Turnbull, *Nepalī* i.e. *Gorkhali* or *Parbate Grammar* (Darjeeling, 1904) and G. A. Grierson, "A Specimen of the Khas or Naipālī Language," in the *Zeitschrift der deutschen morgenländischen Gesellschaft* (1907), lxi. 659 *seq.* There is no authority dealing with Western Pahari as a whole. A. H. Diack's work, *The Kulu Dialect of Hindi* (Lahore, 1896), may be consulted for Kuluhi. *See* also T. Grahame Bailey's *Languages of the Northern Himalayas* (Royal Asiatic Society, London, 1908). Vol. ix. pt. iv., of the *Linguistic Survey of India* contains full particulars of all the Pahari dialects in great detail.

PAHLAVI (formerly Enzeli), the principal port of Persia on the Caspian Sea, 14 m. N. of Resht, in 37° 29′ N., and 49° 28′ E. It has a mixed population of about 20,000, including many Armenians, Turkmans and Caucasians. The port lies in the channel between two sandpits forming the entrance from the Caspian Sea to a great *murdab* or lagoon (20 m by 7 m). The entrance, about 800 yd. wide, is protected by two breakwaters 500 yd. long. The harbour is entered by vessels up to 15 ft. draught except in bad weather. On both sides of the channel are wharves, piers, tanks for oil steamers and storehouses. There is a weekly passenger steamer service for Baku (20 hours), besides other irregular services.

The tonnage of the trade of Pahlavi was 133,585 in 1925–26, or almost twice as much as all the other Caspian ports put together, carried by 319 steam vessels, of which 305 were Russian. The value of the total trade in the same year was 188,223,000 krans (£ St.=45 krans), of which 68,283,000 krans were exports, the chief items being rice (21,499,000 krans), hides and skins (12,310,000 krans), raisins (11,678,000 krans), raw cotton (8,649,000 krans), fresh and dried fruit, gums, textiles and raw silk. Pahlavi is the principal centre of the rice trade of Gilan. The port is connected with Tehran (247 m) via Resht and Kazvin by a road suitable for heavy motor traffic. In 1926 the Junkers Company was granted a concession for the transport by air of mails, passengers and merchandise between Pahlavi and Tehran, connecting with Europe via Baku. During the World War Pahlavi, then known as Enzeli, was held by the Russians. (*See* RESHT.)

PAHLAVĪ or **PEHLEVI,** the name given by the followers of Zoroaster to the character in which are written the ancient translations of their sacred books and some other works which they preserve. (*See* PERSIA: *Language*.) The name, which means Parthian, can be traced back for many centuries; the poet Firdausī (10th century) repeatedly speaks of Pahlavī books as the sources of his narratives and tells us that in the time of the first Khosrau (Chosroes I., A.D. 531–579) the Pahlavī character alone was used in Persia. The learned Ibn Moḳaffa' (8th century) calls Pahlavī one of the languages of Persia, and seems to imply that it was an official language. The passage, in which useful facts are mixed up with strange notions, is given abridged in *Fihrist,* p. 14, more fully by Yākūt, iii. 925, but most fully and accurately in the *Mafātiḥ al-'olūm* (ed. Vloten, 116). The term is now applied to Middle Persian (from the 3rd to the 7th century A.D.), whether written in the older characters of the inscriptions, which begin with the Arsacid (Parthian) kings, or the cursive writing of the Sassanian period.

The great peculiarity of the language is that though it is Iranian, it is full of Semitic (Aramaic) words. Not only Aramaic nouns and verbs, but numerals, particles and pronouns are used side by side with Persian words. It was once thought to be a mixed language, which like English had largely adopted a foreign vocabulary, but it is now recognized that the Aramaic words are ideograms, and that the corresponding Persian word was always used in reading. Owing to the defective alphabet the words are often ambiguous, and some of them cannot be recognized as Semitic, but we can always tell the Persian word intended. This view, the development of which began with Westergaard (*Zend-avesta,* p. 20, note), is in full accordance with the true and ancient tradition. Thus Ibn Moḳaffa', who translated many Pahlavī books into Arabic, tells us that the Persians had about 1,000 words which they wrote otherwise than they were pronounced in Persian. For *bread* he says they wrote LHMA, *i.e.,* the Aramaic *laḥmā,* but they pronounced *nān,* which is the common Persian word for bread. Similarly BSRA, the Aramaic *besrā,* flesh, was pronounced as the Persian *gōsht.*

We still possess a glossary which actually gives the Pahlavī writing with its Persian pronunciation. This glossary, which besides Aramaic words contains also a variety of Persian words disguised in antique forms, or by errors due to the contracted style of writing, exists in various shapes, all of which, in spite of their corruptions, go back to the work which the statement of Ibn Moḳaffa' had in view. Thus the Persians did the same thing, as when in English we write £ (libra) and pronounce "pound" or write & or & (et) and pronounce "and." No system was followed in the choice of Semitic forms. Sometimes a noun was written in its *status absolutus,* sometimes the emphatic *â* was added, and this was sometimes written as א, sometimes as ה. One verb was written in the perfect, another in the imperfect. Even various dialects were laid under contribution. The Semitic signs by which Persian synonyms were distinguished are sometimes quite arbitrary. Thus in Persian *khwēsh* and *khwat* both mean "self"; the former is written NFshH (*nafshā* or *nafsheh*), the latter BNFshH with the preposition *bĕ* prefixed. Personal pronouns are expressed in the dative (*i.e.,* with prepositional *l* prefixed), thus LK (*lakh*) for *tu,* "thou," LNH (*lanā*) for *amā,* "we."

Great difficulties arise from the ambiguous nature of the cursive characters. Modern mss., following Arabic models, introduce diacritical points from time to time, and often incorrectly. But a much more important help is found in the so-called Pāzand or transcription of Pahlavī texts, in which the Semitic words are replaced by Persian as they are to be read, and which are written in the quite clear Avesta character. Pāzand mss. present dialectical variations according to the taste or intelligence of authors and copyists, and all have many false readings. For us, however, they are of the greatest use. To get a conception of Pahlavī one cannot do better than read the *Minōi-Khiradh* in the Pahlavī with constant reference to the Pāzand. *The Book of the Mainyo-i-Khard in the Original Pahlavī,* ed. by Fr. Ch. Andreas (Kiel, 1882); idem, *The Pāzand and Sanskrit Texts,* by E. W. West (Stuttgart and London, 1871). Critical labour is still required to give an approximate reproduction of the author's own pronunciation of what he wrote.

The coins of the later Sassanid kings, of the princes of Tabaristan, and of some governors in the earlier Arab period, exhibit an alphabet very similar to Pahlavī mss. On the older coins the several letters are more clearly distinguished, and in good specimens of well-struck coins of the oldest Sassanians almost every letter can be recognized with certainty. The same holds good for the inscriptions on gems and other small monuments of the early Sassanian period; but the clearest of all are the rock inscriptions of the Sassanians in the 3rd and 4th centuries, though in the 4th century a tendency to cursive forms begins to appear. Only *r* and *v* are always quite alike. In details there are many differences between the Pahlavī of inscriptions and the books. Persian endings added to words written in Semitic form are much less common in the former, so that the person and number of a verb are often not to be made out. There are also

orthographic variations; *e.g.*, long *ā* in Persian forms is always expressed in book-Pahlavī, but not always in inscriptions The unfamiliar contents of some of these inscriptions, their limited number, their bad preservation and the imperfect way in which some of the most important of them have been published leave many things still obscure in these monuments of Persian kings; but they have done much to clear up both great and small points in the history of Pahlavī It was De Sacy who began the decipherment of the inscriptions

Some of the oldest Sassanian inscriptions are accompanied by a text known as Chaldae-Pahlavī, and belonging to the same system of writing, but with many variations in detail, and an alphabet which, though derived from the same source with the other Pahlavī alphabets (the old Aramaic), has quite different forms. It was soon replaced entirely by Sassanian Pahlavī

The name Pahlavī suggests that the system of writing was developed in Parthian times, when the great nobles, the Pahlavāns, ruled and Media was their main seat, "the Pahlav country" Other linguistic, graphical and historical indications point the same way; but it is still far from clear how the system was developed We know, indeed, that even under the Achaemenids, Aramaic writing and speech were employed far beyond the Aramaic lands, even in official documents and on coins The Iranians had no convenient character, and might borrow the Aramaic letters as naturally as they subsequently borrowed those of the Arabs But this does not explain the strange practice of writing Semitic words in place of so many Persian words which were to be read as Persian It cannot be the invention of an individual, for in that case the system would have been more consistently worked out, and the appearance of two or more kinds of Pahlavī side by side at the beginning of the Sassanian period would be inexplicable

The Pahlavī literature embraces the translations of the holy books of the Zoroastrians, dating probably from the 6th century, and certain other religious books, especially the *Minōi-Khiradh* and the *Bundahish* The *Bundahish* dates from the Arab period Zoroastrian priests continued to write the old language as a dead tongue and to use the old character long after the victory of a new empire, a new religion, a new form of the language (New Persian) and a new character There was once a not quite inconsiderable profane literature, of which a good deal is preserved in Arabic or New Persian versions or reproductions, particularly in historical books about the time before Islam Very little profane literature still exists in Pahlavī

See E. W. West, "Pahlavī Literature," in Geiger and Kuhn's *Grundriss der iranischen Philologie* (1896), vol ii; "The Extent, Language and Age of Pahlavī Literature," in *Sitzungsber. der k b Akad der wiss, Phil u hist Klasse*, pp 399–443 (Munich, 1888), and his *Pahlavī Texts* in *Sacred Books of the East* (1880–97). The fullest grammar is *Mittelpersisch* by C Salemann in vol i of the *Grundriss*. Of glossaries, that of West (Bombay and London, 1874) is to be recommended, the large Pahlavī, Gujaratī, and English lexicon of Jamaspji Dastur Minocherji (Bombay and London, 1877–82) is very full, but must be used with much caution. (Th. N ; E. J T.)

PAIGNTON, a seaside resort of Devonshire, England, on Tor bay, 2¾ m S.W of Torquay, on the S W. railway Pop of urban district (1921) 14,451. The church of St. John is mainly Perpendicular, but has a late Norman doorway, and contains a carved and painted pulpit, and in the Kirkham chapel a stone screen Among other buildings and institutions is a novitiate of Marist Fathers Little remains of an old palace of the bishops of Exeter apart from the 14th century Bible Tower Its last tenant was Bishop Miles Coverdale, who in 1535 published the first English translation of the whole Bible. The town has a fine expanse of sand and good bathing facilities.

PAIN, BARRY ERIC ODELL (1865–1928), English humorous writer, was educated at Sedbergh and at Corpus Christi, Cambridge, where he was a prominent contributor to *The Granta*. James Payn inserted his story, "The Hundred Gates," in the *Cornhill Magazine* in 1889, and he became a contributor to *Punch* and the *Speaker*, and other papers. Discerning critics had already seen the authentic touch of comedy in his earlier work when Pain suddenly achieved fame with *Eliza* (1900). In Eliza's fussy, pompous husband he had found the matter for more than local comedy. *Eliza* had sequels, carrying on the tale of the family, and other excellent studies of London life followed, and some ghost-stories. Pain possessed a rare gift of parody, and found subjects for his skits in many best sellers. One of the first of his essays in this kind was *Another Englishwoman's Love Letters*, and one of the last *Madge Askinforit* He died at Watford on May 4, 1928.

PAIN, SIGNIFICANCE OF. In health we are conscious of few bodily sensations other than a sense of well-being, of physical and mental comfort and accord with our surroundings, with the addition, at certain times, of such pleasant attributes as a glowing skin or a ready appetite The normal interruptions to this state of physiological balance are the transitory discomforts of a too-insistent hunger or a full bowel or bladder, or due to fatigue and such external agencies as heat and cold We are made aware of ill-health either by an indefinable malaise or by more localized and disagreeable sensations; of such are nausea, itching, dizziness and shortness of breath, each of which proclaims a derangement of function in certain organs or tissues The purpose of these symptoms is regarded as protective, just as a flow of tears or a winking eye-lid in response to a speck of dust in the eye is protective. The pain which accompanies and would, indeed, seem to induce the weeping and spasmodic movements of the lid is, in the conscious state, an accompaniment of the protective reflex

Biological Purpose.—Of all the sensory phenomena of disease pain in one form or another is the most frequent and frequently the most urgent It differs in kind from the types of discomfort already cited and is due to distinct causes, but the difference between many other discomforts and pain is merely a matter of degree Thus the ache of a muscle employed in some unwonted effort is probably due to the same factors as those which induce an agonising cramp, it only differs from cramp subjectively in being much more bearable. In both states the muscle-fibres are much tautened, more than is usual at rest or after mild activity; but in cramp the tautening increases until painful spasm occurs Similarly the physiological discomfort of hunger, which depends upon an exaggerated tonic and contractile activity of the muscular coat of the stomach, is only a little removed from the hunger-pain accompanying duodenal ulcer, in which tonic and contractile activity are reflexly exaggerated in moments of approaching emptiness by impulses originating in the nerves exposed by the ulcer

The biological purpose of pain, wherever it occurs, and even although this purpose may sometimes seem difficult of acceptance, is undoubtedly protective When the hand is pricked by the hidden pin it is spontaneously withdrawn to prevent a deeper injury We are careful not to bite upon the sensitive tooth The pain of a broken limb or of an inflamed joint compels disuse and an attitude of rest most favourable to healing. The pain of pleurisy compels restricted and shallow breathing to lessen the friction of the delicate lining membranes of the lung and chest-wall which have been invaded by infective agents and roughened by inflammation. The pain of angina pectoris compels instant and complete physical immobility to give the heart the best possible chance of rest and recovery in a moment of circulatory stress dangerous alike to itself and life

Thus, patently in some instances, obscurely in others, pain serves to inhibit actions which would otherwise add further injury to tissues already damaged by disease The victim of tooth-ache or some more serious agony can scarcely be expected to appreciate the methods of nature or to accept suffering as beneficial; religious devotees of varying cults may persist in claiming pain as a punishment or an expiation for sin; but the medical sciences continue to accumulate evidence which establishes pain and the other symptoms of disease as the necessary sensory element of mechanisms physiologically valuable because they prepare the way for nature's healing endeavour by the process of rest.

Physiological Interpretation.—The foregoing statement seeks to explain the biological significance of pain, but it is necessary also to consider the physiological significance of special pains and of pains felt in various organs and tissues of the body From an appreciation of the physiological significance of pain is derived information of the greatest value in medical diagnosis

and treatment. In the skin special nerve-endings, with appropriate paths in the spinal cord have been demonstrated whose service is to transmit painful sensations, which are referred to and appreciated in consciousness at the site of the actual injury. The skin is also endowed with nerve-fibres for touch, heat and cold. If we except the delicate mucous-membranes of the bodily orifices with their special sensibilities, it is doubtful whether any other tissues possess such specialized powers of appreciation and discrimination. Indeed it is clear that they have small need of them.

It is not for instance a function of muscles to appreciate touch, heat or cold, and they are never required to do so; it has also been shown in the living human being that the hollow internal organs such as the intestines, are not sensitive to inappropriate stimuli and that they can be cut, pricked or burned in the conscious subject without any sensation being registered. But tissues other than the skin have their appropriate functions and must, for their own welfare, be appreciative of excessive or inadequate activity or stimulation. Thus the muscles must be able to gauge the strength of opposing forces and must have a limit to the strength with which they can contract and to the number of times they can contract within a certain period. Extreme stretching or extreme contraction of a muscle, as in cramp, causes pain.

The pain in hollow muscular organs, like the stomach, the bowel, the bladder, the bile-ducts and the arteries, also depends upon excessive tonic or contractile action. Thus when a gallstone is impacted in the bile duct—a very narrow tube—a great increase in tension in the wall of the duct necessarily follows and severe pain results until the stone is passed or relief brought by other means. The mucous membrane (or inner coat) and the serous (or outer) coat of all the hollow organs is, as has been indicated, insensitive to the ordinary stimuli which the skin appreciates, but a bubble of wind and still more some pathological stricture by evoking muscular contraction and increased tension of the muscle-fibres in an attempt to dislodge the bubble or to overcome the obstruction, may cause pain which is referred to the deep situation of the part affected. Solid organs like the brain and liver are apparently insensitive to ordinary stimuli painful in the case of the skin. A bullet, a blade or a needle may traverse them and no hurt be felt in their substance. The delicate covering membranes of these organs, however, are responsive to inflammation or stretching, and still more to a combination of these, giving the intense headache of meningitis and the pain and tenderness of an engorged or inflamed liver.

The lung is not sensitive but its delicate pleural investment certainly is, as sufferers from a pleurisy know only too well. Arteries are sensitive but—as with other hollow organs—stretching or spasm are the effective causes of pain. Bone is not sensitive but its transparent covering, the periosteum, is certainly so, especially when its tension is increased by the swelling attendant upon bruising or inflammation. Direct stimulation of a sensory nerve causes pain and other unpleasant sensations along the course of the nerve. The rolled or injured ulnar nerve (or "funny bone") experiences pain at the point of stimulation and simultaneously an electric twitch of pain radiates down the inner side of the arm to the little finger. In sciatica, an inflammatory nerve-pain, the unpleasant sensations are often felt throughout the course of the nerve to its ultimate distribution.

In all these types of pain the sensation is located in consciousness at the part affected, but there are other types of pain which are spoken of as "referred" or "sympathetic." These depend upon the fact that the nerve-supplies to certain deep-seated structures or organs and certain superficial structures have a common origin. In some cases of tooth-ache pain is experienced in the ear or some area of the scalp which may even become tender to touch as though the skin were inflamed, and yet it shows no signs of local disease. This pain and hypersensitiveness is explained by the circumstance that the nerves to the diseased tooth and the sympathetically affected skin have a common receiving station in the ganglion of the fifth or trigeminal nerve. In angina pectoris the pain is often referred down the left arm, because the same segment of the spinal cord supplies both this region and the heart with its immediate arterial offshoots. In gall-bladder inflammation the pain is often referred to the shoulder-blade, in inflammation of the diaphragm to the shoulder itself, by reason of a similar sharing of segmental nerve-supplies. The tenderness which may develop in these surface areas of sympathetic pain may be of very great value to the physician in his decisions as to the nature and localization of deeply-seated and invisible inflammations. The stimuli in the deep-seated structures potent for the production of referred or sympathetic pain and hypersensitiveness are either some violent mechanical insult as in the case of an impacted gall-stone or kidney-stone, or some more sustained irritation such as is caused by active inflammation in the wall of the organ.

Numerous observations may be made by the physician with regard to a particular pain and each of these may have a special value in helping him to draw conclusions as to its seat of origin, its nature and its ultimate causes. Thus he can elicit information in regard to:—(1) Its character (whether gnawing, aching or burning); (2) its severity (whether easily borne or agonising); (3) its exact situation; (4) its localization or extent of diffusion; (5) its paths of sympathetic propagation or reference; (6) its duration; (7) its frequency; (8) the special times at which it is liable to occur; and, finally, (9) and (10) its aggravating and relieving factors. From such an inquiry he is able to endow pain with a *diagnostic significance* which, in the civilised community, by providing indications for its medical or surgical relief, further serves to enhance its natural value as a protective agent.

PAINE, ROBERT TREAT (1731–1814), American politician, a signer of the Declaration of Independence, was born in Boston, Mass., on March 11, 1731. He graduated at Harvard in 1749, and was admitted to the bar in 1759. In 1768 he was a delegate to the provincial convention which was called to meet in Boston, and conducted the prosecution of Captain Thomas Preston and his men for their share in the famous "Boston Massacre" of March 5, 1770. He served in the Massachusetts general court (1773–74), in the provincial congress (1774–75), and in the Continental Congress (1774–78), and was speaker of the Massachusetts house of representatives in 1777, a member of the executive council in 1779, a member of the committee which drafted the Constitution of 1780, attorney-general of the State from 1777 to 1790, and a judge of the state supreme court from 1790 to 1804. He died in Boston on May 11, 1814.

See John Sanderson, *Biography of the Signers of The Declaration of Independence* (Philadelphia, 1823), vol. ii.

PAINE, THOMAS (1737–1809), English author, was born at Thetford, Norfolk, the son of a Quaker staymaker. After several years at sea and after trying various occupations on land, Paine took up his father's trade in London, where he supplemented his meagre grammar school education by attending science lectures. He was given in 1762 an appointment in the excise, was discharged for neglect of duty in 1765, but, on offering explanations and apologies, was restored, taking an appointment in 1768 at Lewes. His married life was unhappy, his finances became embarrassed and in 1774 he left Lewes, losing his post, leaving his goods to his creditors, and separating from his wife. Encouraged by Benjamin Franklin, he sailed to America, where he arrived in Nov. 1774, and was set to edit the *Pennsylvania Magazine.* On Jan. 10, 1776, he published *Common Sense*, a remarkable and powerful republican pamphlet which had an immediate success. Written in simple, convincing language, it was read everywhere, and the open movement to independence dates from its publication. Washington said that it "worked a powerful change in the minds of many men." When war was declared, and fortune at first went against the colonists, Paine, who was then serving with General Greene as volunteer aide-de-camp, wrote the first of a series of influential tracts called *The Crisis,* of which the opening words, "These are the times that try men's souls," became a battle-cry Paine's services were recognized by an appointment

to be secretary of the commission sent by Congress to treat with the Indians, and a few months later to be secretary of the Congressional committee of foreign affairs. In 1779, however, he indiscreetly published information gained from his official position, and was compelled to resign. He was afterwards clerk of the Pennsylvania legislature, and accompanied John Laurens during his mission to France. His services were eventually recognized by the State of New York by a grant of an estate at New Rochelle. From Congress he received considerable gifts of money

In 1787 he sailed for Europe with the model of an iron bridge he had designed, but his chief object was to repeat his American success His first efforts, in the *Prospects on the Rubicon* (1787), were directed against Pitt's war policy When Burke's *Reflections on the Revolution in France* appeared, in 1790, Paine at once wrote his answer, *The Rights of Man.* The first part appeared on March 13, 1791, and had an enormous circulation before the Government took alarm and endeavoured to suppress it. Pitt "used to say," according to Lady Hester Stanhope, "that Tom Paine was quite in the right, but then he would add, 'What am I to do? As things are, if I were to encourage Tom Paine's opinions we should have a bloody revolution' " Paine was indicted for treason in May 1792, but before the trial came off he was elected by the department of Calais to the French Convention. William Blake, the poet, hustled him prudently out of England, and he took his seat in the French convention Paine, who understood neither the French language nor the dreadful difficulties of the revolution, rapidly made himself unpopular with the Jacobins He incurred the suspicion of Robespierre, was thrown into prison, and escaped the guillotine by an accident Before his arrest he had completed the first part of the *Age of Reason,* the publication of which made an instant change in his position on both sides of the Atlantic, the indignation in the United States being as strong as in England. The *Age of Reason* was written from the point of view of a Quaker who did not believe in revealed religion, but who held that "all religions are in their nature mild and benign" when not associated with political systems Mixed with the unceremonious ridicule of what he considered superstition are many passages of earnest and even lofty eloquence in favour of a pure morality founded on natural religion The work in short—a second part, written during his ten months' imprisonment, was published after his release—represents the deism of the 18th century in the hands of a rough, ready, passionate controversialist

At the downfall of Robespierre Paine was restored to his seat in the convention, and served until it adjourned in Oct 1795, his last speech being an effort to save universal suffrage In 1796 he published a long letter to Washington, attacking his military reputation and his presidential policy with a bitterness due to his belief that Washington and the Americans had deserted him when in danger of death in France In 1802 Paine sailed for America, but found his popularity extinguished. He died in New York on June 8, 1809, and his body was in 1819 removed to England by William Cobbett

Quart. Rev*, vol. iii, pp 571-584 (Charlottesville, Va., 1927); and Mary Agnes Best, *Thomas Paine, Prophet and Martyr of Democracy* (1927).

PAINESVILLE, a city of Ohio, U S A, the county seat of Lake county; on the Grand river and Federal highway 20, 3 m S of Lake Erie and 30 m N E of Cleveland It is served by the Baltimore and Ohio, the New York Central and the Nickel Plate railways. Pop. (1920) 7,272 (87% native white) It is the seat of Lake Erie college for women, founded as Willoughby seminary in 1847. The city has large nurseries and a variety of manufacturing industries. It operates under a commission-manager form of government. Painesville was founded in 1800–02 by settlers from Connecticut and New York, and was named after General Edward Paine of Connecticut, a Revolutionary officer. It was incorporated as a village in 1832 and became a city in 1902

PAINLEVÉ, PAUL (1863-   ), French politician, was born in Paris on Dec 5, 1863 He was educated at the École Normale Supérieure and became a doctor in mathematical science, soon showing himself to be a mathematician of the first rank. He became a professor at the Sorbonne, and was elected a member of the French *Académie des Sciences.* From the time of the Dreyfus case his interest in politics increased; in 1906 he was elected deputy for Paris as an independent socialist and took a special interest in all questions relating to the army, navy and air force It was not, however, until the World War that Painlevé occupied a political position of any great importance In Briand's cabinet, formed on Oct. 29, 1915, Painlevé became minister of public instruction and of inventions, but finding himself in disagreement with Briand in regard to the conduct of the war, he ceased to be a member of the Briand Government when the latter was reconstructed on Dec 12, 1916

In March 1917 Ribot became premier and gave the portfolio of minister of war to Painlevé, who proceeded to appoint General Pétain in place of General Nivelle as commander-in-chief of the French Army On the resignation of Ribot, Painlevé himself formed a cabinet on Sept. 12, 1917 He would have included the socialists in his government, but owing to their exaggerated demands he was unable to come to an agreement with them. In addition to being premier, Painlevé continued to be minister of war On Oct 19, in consequence of a vote of the Chamber, he felt that his majority was insufficient, and therefore resigned, but he at once reconstituted his cabinet, replacing Ribot by Barthou at the ministry for foreign affairs A few days later, after the Italian disaster at Caporetto, he went to Rapallo at the same time as Lloyd George to meet the Italian premier, Orlando These discussions resulted in the creation of the Supreme Allied Council at Versailles, General Foch being chosen by Painlevé as the chief representative of France On Nov 13, the Chamber having refused to postpone questions regarding "defeatism," Painlevé resigned and was succeeded by Clemenceau

After some years of restricted political activity, Painlevé with Herriot helped to form the *cartel des gauches,* which obtained a majority in the general elections of May 11, 1924 The two heads of this group, Herriot and Painlevé, became premier and president of the chamber respectively. The radicals now organised a kind of ministerial strike, with the result that Millerand was forced to resign the presidency of the Republic The attempt to replace him by Painlevé failed, and Doumergue was elected president. In April 1925 Herriot was forced to resign after a defeat in the Senate on financial questions and Painlevé succeeded him as premier, taking over the portfolio of war as well Caillaux became minister of finance, a position of special importance at that time of financial crisis

In June Painlevé went by air to Morocco, where owing to the offensive of Abdel-Krim a difficult situation had arisen, later he sent out Marshal Pétain to organise resistance and direct a counter-offensive In July he found it was impossible to remain in power without the support of a section of the opposition, for the socialists refused to accept the fiscal policy of Caillaux In October, therefore, with a view to gaining the support of the extreme left, Painlevé himself took over the ministry of finance from Caillaux But on Nov 21 he found himself with a minority in the chamber owing to his financial proposals. He was succeeded as premier by Briand; and, both in that government and in the one formed by Briand in March 1926, Painlevé continued to hold the portfolio of War He was also minister for war in the two successive cabinets formed by Poincaré at the end of July 1926 and in November 1928

Painlevé was made a member of the academies of science of France, Bologna, Stockholm and Upsala as well as of the Reale Accademia dei Lincei in Rome Among his various works on mathematics may be mentioned: *Leçons sur le frottement* (1895), and *Leçons sur la théorie analytique des équations différentielles* (1897). (P B)

PAINT. A paint may be defined as a liquid, containing in suspension a solid coloured material known as the pigment, which is applied to surfaces both for decorative and protective purposes

A paint consists of a mixture of (i) a solid pigment (or a mixture of pigments) and (ii) a liquid medium (known as "the

vehicle"). The vehicle is usually composed of linseed oil (or other drying oil), a drier, and turpentine or other volatile thinner. The linseed oil is added to furnish a binder for the pigments, the drier to accelerate the rate of drying, and the turpentine to give the paint the proper flowing consistency, and to promote ease of application. When a paint is applied the turpentine, being volatile, rapidly evaporates from the painted surface, leaving behind the pigment and oil mixture as a wet coating; this mixture gradually dries into an elastic solid skin owing to the oil absorbing oxygen from the air. The solidified oil acts as a binder for the pigments and holds them in their place; a tough paint film is thus formed which adheres firmly to the surface, and serves both to protect and decorate.

A good quality of paint should be easily applied, cover well, and be opaque, or as it is generally described, possess good "body" or hiding power. The body and covering power of a paint is dependent on the amount and nature of the pigments it contains in suspension; and, as a rule, the finer the state of subdivision of the particles of the pigment the greater the body and covering power. The durability of a paint is mainly dependent on the nature of the oil medium component, and only pure drying oils should be used in their preparation. It is sometimes stated that the oil is the life of the paint. If this were true, oil alone should be more durable than paint, which is far from being the case, since, in fact, oil films do not wear as well as paint films because the addition of pigments to the oil films tends to reinforce them and to make them dry off harder and become more impervious to air and moisture. Ordinary paints should dry with a glossy surface, but they can be made to dry with a flat finish by decreasing the oil content and increasing the proportion of turpentine or other volatile thinner.

The durability of a paint as regards its protective and wearing properties can only be determined by practical exposure tests over a series of years. Additions of heat-treated linseed oil (stand oil), and blown linseed oil to paint mediums increase their durability and wearing properties to a remarkable extent, and impart to them highly elastic and waterproof properties. The same result is also obtained by using a paint medium made from elastic copal varnishes, or Chinese wood oil (Tung oil) varnish.

On the other hand, the use of mineral oils, rosin oils, rosin varnishes or other soft rosin varnish mediums, will cause the rapid deterioration of paint films on exposure, resulting in the paints cracking and chipping off after only a few months' exposure.

The protective and anti-corrosive properties of paints vary greatly according to their composition. For example paints containing mixtures of white lead and zinc oxide pigments are extremely durable and are therefore the most satisfactory for outside use; where it is desired to protect ironwork from corrosion paints containing red lead or graphite are the most efficient.

Paints on exposure over a period of years may chalk (powder off), crack, blister or shell off; the colour of the original paint may also change or even completely disappear. A high-class durable paint for outdoor use should wear well over four or five years, retain its colour, and chalk only to a moderate degree. Paints which blister or crack are unsatisfactory inasmuch as it is then necessary to remove completely all the loose and badly adhering paint before any repainting can be done.

In this article pigments are first described, then the mediums or vehicles by which these pigments are converted into paints, and lastly the paints themselves.

Pigments.—These are finely divided insoluble coloured powders obtained from naturally occurring earth colours, or prepared by chemical manufacturing processes. In the manufacture of paint, it is essential that the colours or pigments used should be in the form of a fine dry powder; this result is achieved by subjecting them before use to a grinding and sieving process.

The pigments which are commonly used in the manufacture of paints are as follow:—

White Pigments:—White lead, zinc oxide, titanium white, antimony oxide, lithopone, basic sulphate of lead.

Inert Pigments or Extenders:—Barytes, blanc-fixe, gypsum (terra alba), asbestine, Paris white (whiting), China clay, silica.

Yellow Pigments:—Chrome yellow, zinc chrome, French ochre, cadmium yellow raw sienna, orange chrome.

Blue Pigments:—Ultramarine blue, Prussian blue, Chinese blue, cobalt blue, Brunswick blue, Antwerp blue.

Green Pigments:—Brunswick green, chromium oxide green, emerald green, verdigris.

Red Pigments:—Red lead, orange lead, Persian red, vermilion, Venetian red, Turkey red.

Brown Pigments:—Vandyke brown, sepia, umber, burnt sienna.

Black Pigments:—Vegetable black, carbon black, ivory black, graphite.

Lake Pigments:—Signal red, royal red, carmine lake, crimson lake, mahogany lake, violet lake.

For a fuller description of pigments *see* PAINTS, CHEMISTRY OF.

Media or Vehicles.—The liquid portions of paints which act as binders for pigments.

The vehicle of ordinary ready-mixed oil paint consists of raw linseed oil—or a mixture of raw and boiled linseed oil—with a small proportion of turpentine, which is added to make the paint more fluid and to promote ease of working. As turpentine is rather expensive, turpentine substitutes, made from a petroleum distillate (white spirit), are often used as a thinning agent. A small proportion of liquid driers (terebine) is usually incorporated in the medium: these driers are solutions of salts of lead, manganese and cobalt, and increase the rate of drying of the oil by what is known as "catalytic" action. The medium used in the preparation of varnish paints, which dry with a high gloss surface, consists of either an elastic copal varnish or a wood oil varnish. (*See* VARNISH.)

Artists' oil paints are usually made in the form of a stiff paste and sold in tubes; the vehicle consists of either poppy seed oil or sun-bleached linseed oil, which is used in order to retain the purity of colour of the pigment. A less satisfactory medium is "megilp" composed of linseed oil and mastic varnish. The vehicles for artists' water-colour paints are chiefly solutions in water of gum-arabic, albumen, isinglass and size. Distemper and water paints are made with emulsified glue or casein vehicles. The medium of the modern cellulose paints or enamels consists of a solution of nitro-cellulose in acetone, amylacetate or other suitable mixed solvents.

Manufacture of Paint.—The process of manufacturing oil paint consists in mixing the dry fine pigment with sufficient medium to convert it into the form of a stiff paste. This stiff paste is then transferred to a roller mill, or other grinding machine, finely ground, and finally conveyed to special paint mixing machines, where it is thinned to the right consistency.

Usually a small proportion of paste driers, or liquid driers is added at this stage, to accelerate the drying of the paint.

As an immense variety of paint products are manufactured for industrial uses, it would be impossible to give more than a brief description of the most important varieties in common use.

Ready-mixed Paint.—The most common and generally used paint is ordinary ready-mixed oil paint. This paint consists of pigments ground and mixed in a vehicle consisting of a mixture of raw and boiled linseed oil, with a small proportion of turpentine. Pure pigments only are today used in the preparation of most of these paints, but a proportion of some inert pigment or extender is sometimes added to cheapen the cost of the paint. These paints are manufactured in a large variety of colours. The most commonly used white paints are white lead and zinc white paints.

White lead paint possesses exceptional opacity or obscuring power, and has a peculiarly smooth working property which causes it to flow out evenly under the brush. It is considered to be more durable than paints made from other bases, and is therefore especially suitable for external painting. The chief disadvantage of white lead paints is that they are poisonous and great care must be taken to ensure absolute cleanliness after their use. They should not be used for any internal painting work such as the painting of walls, fixtures, furniture, etc. For the provisions of the (British) Lead Paint Act, 1926, *see* PAINTER WORK.

Another disadvantage of white lead paints is that they darken with age, and become discoloured when exposed to the fumes of sulphuretted hydrogen which exists to a greater or less extent in the atmosphere of all large towns. For this reason paints made

ITALIAN AND FRENCH PAINTINGS OF THE EARLY RENAISSANCE

1. "Death of St. Francis" by Giotto di Bondone (1266–1337). Fresco in the Bardi Chapel, church of Santa Croce, Florence
2. "Annunciation with S.S. Ansano and Judith," triptych by Simone Martini (*c.* 1283–1344) and Lippo Memmi (fl. 1317–47). In the Uffizi Gallery, Florence
3. Detail of "The Triumph of Death," a fresco attributed to Andrea Orcagna (*c.* 1308–68). On the wall of the Campo Santo, Pisa
4. "Deposition from the Cross" by Rogier Van der Weyden (*c.* 1400–64), Flemish. In the Escorial, Madrid
5. "Pietà" by an unknown artist of the Avignon School, southern France, 15th century. Now in the Louvre
6. "Adam and Eve driven out of Paradise" by Tomaso Guidi Masaccio (1401–28), Florentine School. In the Brancacci Chapel, church of the Carmine, Florence
7. "The Annunciation" by Fra Angelico (Giovanni da Fiesole) (1387–1455). Fresco on the wall of a dormitory cell in the Museum (formerly the monastery) of San Marco, Florence

ITALIAN PAINTINGS OF THE EARLY AND HIGH RENAISSANCE

Left: Fra Angelico (Giovanni da Fiesole, 1387–1455), "Coronation of the Virgin," a fresco. The figures in the foreground are Saints Paul, Thomas Aquinas, Benedict, Dominic, Francis and Peter Martyr. In the Museum (formerly the convent) of San Marco, Florence

Right: Raphael (Raffaello Sanzio, 1483–1520), "The Marriage of the Virgin," painted in 1504 for the church of S. Franceso at Citta di Castello. Now in the Brera Gallery, Milan

on a white lead base cannot be used on gas-holders or in the neighbourhood of a gas-works, as they would rapidly turn quite black.

On account of the many disadvantages of white lead paints a large demand has arisen in recent years for "leadless" or non-poisonous white paints. The chief pigment used in the manufacture of non-poisonous white paints is zinc oxide (zinc white). Zinc oxide, besides being non-poisonous, is a purer white colour than white lead, and hence lends itself admirably for all interior paint-work. It is not so opaque, *i.e.*, it does not obscure or hide so well, as white lead, but is superior in covering or spreading power. Other pigments used in the manufacture of non-poisonous white paints are, lithopone, titanium white and white oxide of antimony. Titanium white was only introduced as a paint pigment during the second decade of this century, but is rapidly coming into favour on account of its remarkable permanency and stability under all atmospheric conditions, and also because of its high obliterating power or opacity which is far greater than that of white lead. A white paint made with a mixture of zinc oxide and titanium white pigment as the base, and a vehicle consisting of heat-treated linseed oil or wood oil (tungoil) varnish, gives an excellent durable paint suitable for exterior use.

This paint has excellent covering and obscuring properties, wears well over a long period of years, and—unlike white lead—will not discolour or turn black even on exposure to sulphuretted hydrogen, acid fumes or other noxious gases. The large variety of light shades or tints in common use, are obtained by the addition of a small proportion of various coloured pigments to white paint; thus for example white paint and vegetable black give greys from the lightest to the darkest hue, depending on the proportion of white and black used. Buff is obtained by tinting white paint with yellow ochre, cream colour results from adding a touch of chrome yellow to white and so on.

The amount of oil required to convert a pigment into paint form varies with the specific gravity of the pigment; a heavy pigment such as white lead (sp.gr. 6·75) will require considerably less oil than a bulky pigment, such as zinc oxide (sp gr. 5·47) or vegetable black (sp gr. 1·72). The ready-mixed paints so largely sold in small packages (1, 2 and 7-lb. tins) for amateur use are, as a general rule, of very poor quality on account of the large amount of inert pigment which they contain; for this reason they are often deficient as regards body and covering power.

Enamel or Varnish Paint.—These types of paints dry with a brilliant glossy surface. They are made by grinding the selected pigment, or mixture of pigments, in a varnish medium, and their nature and properties depend on the type of varnish used. A quick-drying variety is made by using a cheap rosin varnish as the vehicle, it dries with a high gloss surface in about 2–4 hours, but owing to the brittle and non-durable nature of the varnish used it is only suitable for interior use. High-class durable enamels, suitable for both inside and outside use, are made by using mixtures of heat-treated linseed oil (stand oil) and elastic copal varnishes as the vehicle. They are slow-drying, taking from 12–18 hours, and are very tough under the severest climatic conditions

Flat Paint.—This type of paint is really a flat-drying enamel. It is made in much the same way as the high class glossy enamels, except that it contains less varnish and more turpentine than ordinary enamel. Some varieties contain a proportion of wax dissolved in the varnish so as to give a more perfect mat or flat finish. Owing to their pleasing decorative effect they are used for interior decorations, but are not suitable for outside use.

Anti-corrosion Paints.—These paints are largely used for protecting iron and steel structures from rusting. The best anti-rust paint is undoubtedly red lead paint; which is made by mixing red lead with raw linseed oil. As red lead in linseed oil rapidly sets into a hard mass if kept for any length of time it is necessary to mix it just before use. A non-setting red lead has been introduced which obviates this defect and will keep, when mixed in linseed oil, in a liquid condition for any length of time.

Graphite paints, red oxide paints and paints made from basic sulphate of lead are also largely used for the preservation of ironwork. Bituminous paints are also extensively used for painting ironwork, such as gas-holders, bridges, docks, etc., on account of their comparative cheapness and excellent anticorrosive properties. They are composed of an asphalt or bitumen base dissolved in coal tar or naphtha solvent. They are usually black, but other colours can be obtained, which are made by the addition of strong staining pigments to the base.

Anti-fouling Paints.—These paints are used on ships' bottoms in order to prevent the growth of barnacles and weeds.

They are as a general rule quick-drying iron oxide paints, to which a proportion of poisonous material, such as white arsenic, copper suboxide, mercury oxide, etc , has been added. In contact with sea water, these poisonous materials gradually dissolve and thus prevent any deposit or growth forming on the ship's bottom

Coach-builders' Paint.—These varieties of paints are made specially for coach-builders use. They consist of pure pigments, extremely finely ground, in a special quick-drying varnish medium known as goldsize. They are supplied in paste form, and require to be mixed with turpentine to prepare them for use. They are also made ground in turpentine, and in this form require to be thinned with goldsize, flatting varnish or other varnish medium.

Metallic Paint.—Metallic paints, such as aluminium, copper bronze and gold paints are prepared by mixing the finely powdered metals, or their alloys, with suitable varnish media. The metals must be in an exceedingly fine state of sub-division, and are manufactured from the metal leaf by special processes involving the use of intricate grinding machinery. The media used may be either thin copal varnishes or celluloid varnishes.

These paints are heat-resisting, and hence are largely used on hot-water pipes, radiators, etc. They dry with a pleasing metallic sheen.

Fireproof Paint.—These paints are made for use on woodwork, composition boards and other inflammable material. They are usually ordinary oil paints containing a proportion of fine asbestos, borax, sodium tungstate and other fire-retarding materials

Cellulose Paint.—The modern cellulose paints or lacquers consist of a pure pigment, or mixture of pure pigments, ground in a medium made by dissolving nitro-cellulose in suitable solvents

They dry very quickly with a beautiful soft lustre, which is hard, tough and very durable. They are not affected by steam, moisture, petrol or extremes of heat or cold; and may be used on all woodwork, new or old, furniture, motor-cars, floors, walls and metal work. Their popularity is due to their quick-drying properties, which enable work to be finished very much more expeditiously than by the older methods of oil painting. They are highly inflammable

Gardner, *Paint Technology and Tests;* S Cushmann and H. A. Gardner, *Corrosion and Preservation of Iron and Steel.* J. G. Bearn, *The Chemistry of Paints, Pigments and Varnishes* (1925) contains a full bibliography. (J. G. BE)

PAINT-BRUSH, the name given to plants of the genus *Castilleja,* of the figwort family (Scrophulariaceae), parasitic on the roots of other plants There are about 50 species, natives chiefly of the New World, but with representatives in Asia. They are most numerous in the Rocky mountain region and on the Pacific coast. They are annual, biennial or perennial herbs, usually 1 to 3 ft. high, with alternate, often deeply cleft or parted leaves, and showy red, yellow or white flowers, borne in dense terminal clusters (spikes), the conspicuous leafy bracts of which are often highly coloured

PAINTER-WORK IN THE BUILDING TRADE. In painter-work the most important fact to remember is that the cost of applying paint is from four to five times the cost of the paint itself, and therefore to use materials of poor quality, because of their relative cheapness, is false economy. The use of paint for decorative purposes is ordinarily secondary in importance to its function as a protector of surfaces from decay. The paint used must be selected carefully according to the purpose for which it is to be employed. For outside use it is essential that the paint chosen should resist atmospheric weathering; in paints used for indoor work great durability becomes less important than a

pleasing finish. In the article PAINT a detailed description is given of the composition of the paints in common use, and of the work for which they are most suited. Until recently, the paints in most common use were based on white lead, and such paints are still very largely used. They cover well and are easy to work. Owing, however, to the danger of lead poisoning (*see* PAINT), their use for interior painting is not to be recommended and they have been largely superseded by leadless or non-poisonous paints made on a zinc or titanium base. The British Lead Paint (Protection against Poisoning) Act, 1926, makes the following regulations for preventing danger from lead paint to persons employed in or in connection with the painting of buildings:—

1. Lead paint shall not be stored, or transported, otherwise than in receptacles legibly marked as containing lead paint.
2. Lead paint shall not be applied in the form of spray in the interior painting of buildings.
3. No painted surface (containing lead) shall be rubbed down, or scraped by a dry process.
4. Every person employed in or in connection with the painting of buildings and liable to come into contact with lead paint shall carefully clean and wash his hands before each meal-time before leaving work.
5. Every person employed in or in connection with the painting of buildings and liable to come in contact with lead paint shall present himself at the appointed time for medical examination.

The tools and appliances of the painter are mixing pots, paint kettles, strainers, palette knife, scraping knife, hacking, stopping and chisel knives, sponge and pumice for washing and rubbing down, blow-lamp for burning off, and a large variety of brushes.

It is absolutely essential for good work to use brushes of a good quality. Brushes must be well cleaned after use, though for keeping overnight it is generally sufficient to wrap them in several thicknesses of paper. Some painters keep their brushes soft overnight by putting them in water. If, however, the brush is not to be used for some time it should be well washed in turpentine and hung up to dry.

Re-painting Old Woodwork.—One of the most important considerations in painting is the proper preparation of the surface to be painted. If this is in good condition it will be sufficient to scrub down with soap and water and afterwards rinse with clean water and wipe dry. If the work has become rough it will often be necessary to use pumice stone to facilitate cleaning. The pumice should be cut or rubbed to a flat surface and vigorously applied with plenty of clean water. It is essential that the work should be quite dry before any paint is applied. If the old paint is cracked or in such a condition as to be ready to break loose as soon as a new coat is applied over it, it must be removed before re-painting. The best method of removing old paint is by burning it off with special painter's blow-lamps; the heat causes the film to soften and it can then be scraped off. Paint may also be removed by strong caustic soda preparations but these are a frequent source of trouble if the soda is not properly removed before new paint is applied. Thorough washing is necessary either with water alone, or preferably with water to which a small quantity of vinegar has been added. Paint removers are now marketed made from mixtures of volatile solvents. They are very inflammable.

Painting New Woodwork.—New woodwork requires to be knotted, stopped, primed, and in addition painted with two coats of undercoating and one coat of finishing oil paint. If paint were applied over the bare knots of new wood it would be destroyed, or at least discoloured, by the exudation of resin from the knots. This is prevented by coating the knots with knotting varnish, made by dissolving shellac in methylated spirits. The purpose of the priming coat is to fill the pores of the wood and to furnish a foundation. The priming coat is a thin paint made by substituting turpentine for part of the oil in ordinary paint, and dries with a flat hard surface.

After the priming coat is thoroughly dry, all nail holes and cracks in the wood should be stopped with white lead putty; and when hard, sandpapered to give a smooth even surface. Two coats of undercoating paint are then applied to give a solid foundation for the final finishing coat.

Painting on Iron.—All structural iron and steel work must be thoroughly cleaned from scale and rust before painting by the use of hammers, scrapers and wire brushes, and all grease carefully washed off with benzine. Three coats of paint should then be applied. The priming coat should be red lead paint and the subsequent coats may be either white lead, basic sulphate of lead, or red oxide paints.

Spraying or Dipping.—The method of applying paints by the dipping or spray process is now largely used industrially, as it enables painting work to be finished much more expeditiously than by the ordinary brush process. In the spray process the paint is applied by forcing it under pressure through a spray-pistol; the dipping process consists in immersing the objects in the paint, and subsequently hanging them up to dry. For use in these processes it is necessary that the paint should be of a thin consistency.

Painting on Cement and Plaster Work.—Paint should not be applied on new cement or plaster surfaces as they contain free alkali which is destructive to paint. The best treatment is either to leave the work unpainted for about 12 months, when most of the free alkali will have disappeared, or to apply a coat of distemper. If it is essential that the work be painted immediately, then the free alkali may be neutralized by washing thoroughly with a solution of 3 to 4 lb. of zinc sulphate in one gallon of water.

Painting on New Galvanized Iron.—Paint will not adhere to new galvanized iron, because it has no grip on the smooth greasy metallic surface. To overcome this difficulty new galvanized surfaces should be treated with a solution containing 4 oz. of copper acetate, or copper chloride in one gallon of water.

Paint Troubles.—*Slow-drying.* This may be due to several causes.

(1). The use of insufficient driers. The quantity of driers required to make a paint dry in a reasonable time depends upon its composition, and also on the weather conditions when the paint is applied. Dark coloured paints, such as black paints and purple oxide paints, require considerably more driers than white lead paints, also more driers are necessary when painting in the winter than in the summer months. Painting work should never be done during damp, cold, foggy weather, as otherwise the paint may take several days to dry.

(2). Faulty preparation of the work. Paints will not dry on greasy or dirty surfaces, hence it is absolutely essential to take care that all the work has been thoroughly washed down and cleaned before paint is applied.

(3). The use of adulterated oils. Paints made with adulterated oils such as mineral oils, paraffin oils and resin oils, will not dry off hard, but always remain soft and "tacky."

Blistering. The cause of paint blistering is often due to painting on damp work or timber which has not been properly seasoned. Blisters may also be caused by the use of too much oil in paint exposed to heat, or the application of one coat upon another before the latter is properly dry.

Cracking is caused by the use of too much oil in the undercoats and too little in the top coats. It may also be due to the paint containing insufficient oil, or a resin varnish.

Loss of Gloss. If a paint is applied on a porous surface, or one that has not been properly primed, it will dry with a poor gloss owing to the paint "sinking in." Paint when applied in damp or wet weather often loses its gloss and dries with a dull finish, owing to the action of the moisture on the paint film during the process of drying.

See W. J. Pearce, *Painting and Decorating* (1927). (J. G. Be.)

PAINTING. In the occidental world, painting is as old as sculpture and it attained from the beginning an astonishing perfection. In the glacial age tribes of hunters and fishermen (though there was little real difference between them and ourselves), decorated the walls of the caves, which served them for shelter, with drawings sometimes enhanced by simple colours—black, ochre or red brown.

It is difficult to determine the intention and significance of these drawings which were executed in subterranean darkness, where they must have been almost invisible at the time they were drawn. Of the several hypotheses that have been proposed, perhaps the most reasonable, which applies also to those animal drawings on

rocks, engraved on the bones of reindeer, or slabs of schist, is that the hunters who executed them believed that they had magic powers and signified thereby both the need and the promise of a capture necessary to the life of the tribe. But what is most surprising and inexplicable is the delicacy, truth and beauty of these reindeer and bison in postures so accurately observed, so true and so full of life that in our eyes they have even that quality which we call style, and which, though drawn by men who were incapable of constructing the most primitive roof, have been unequalled centuries later by those of an infinitely higher state of civilization, who, by slow succession of painful conquest, elaborated many of the elements of art.

ANCIENT PAINTING

Egypt.—Egypt shows a remarkable knowledge of painting, and here as with the men of the reindeer age it was developed in friezes on walls, which were no longer the sides of caves but constructed by the hand of man and covered with fine chalk. In the tombs, for Egyptian art, like Egyptian religion, is mingled with the cult of the dead, images of the deceased, showing his past occupations, had a religious significance and upheld and supported the existence of the *double* on the mysterious voyage after death in the same way that they represented and upheld the existence of the living man on earth. This liturgic conception of art explains the characteristics of Egyptian painting and sculpture; hieraticism was expressed by unchangeable conventions and resulted in a unique solemnity of style. On the other hand, realism was minutely and precisely applied in the most familiar scenes. (*See* EGYPT: *Archaeology and Art.*)

Greece.—That Egypt played a large part in the formation of Greek painting as well as sculpture was recognized by the Greeks themselves, who improved what had gone before by the development of action which grew from the earliest Aegean civilization, as proved by fragments of frescoes found in Cnossos contrasting strongly with the impressive immobility of the Egyptian art. The defective state and the small number of paintings which survive are likely to deceive us as to the relative importance of the three arts: painting, sculptures and architecture. Let us remember the admiration expressed by the ancient authors for the illustrious painters Polygnotus, Protogenes, Zeuxis and Apelles, emulators in their eyes of the great sculptors Pheidias and Praxiteles, though the works of these painters have entirely disappeared. Therefore, we must turn to the Pompeian epoch for traces of Greek painting, for it was Greek artists and their pupils who executed the decorations in the villas of the rich Pompeians. Nevertheless, it is easy to believe that between these elegant and charming paintings and the grand frescoes which adorned the Poikilos (*see* Pheidias; Praxiteles) of Athens or the Lesche of Delphi lay the same difference as between the Olympian Zeus of Pheidias or even the Hermes of Praxiteles, and the amiable statuettes of bas-reliefs of the skilful workmen representing the formula of the Alexandrian school. Only from decorations on vases with black or red figures and lecythi with white backgrounds can we derive any idea of the style and principles of composition honoured in great painting during the golden age (*see* POTTERY AND PORCELAIN: *Greek*) for, so far as can be determined from these sources, drawing, in the most subtle and broad sense, is the dominating element of their painting. The Pompeian decorations, however, are more realistic, including sometimes indications of light and shade and thus pointing the way to some of the essential elements of later painting.

Early Christian.—Christian painting was conceived in the catacombs, content to utilize the types and formulae borrowed from the refectories of the Pompeian decorators and change them into symbols of the new religion. In spite of the mediocre talent of the workers in executing these paintings in which Orpheus became the image of the Good Shepherd, we find a pure and candid grace peculiar to early Christian sentiment. In the Near East the traditions of ancient art survived for a longer period, for it gave birth to Byzantine Art (*q.v.*) incorporating by its hereditary character an immovable and grandiose formula reminiscent of that of Egypt. Mosaics, to which the ancient Romans had already given an important place in the decoration of pavements, took the place of paintings as the principal form of mural decoration. Golden backgrounds surrounded the rigid majestic figures of Christ, angels and apostles, gleaming in the domes and cupolas of Christian basilicas. The luxury, brilliance and incorruptibility of the material, as well as the severe simplification of drawing and colour necessary to the technique of mosaic, was probably thought most suitable for the ornamentation of the house of the Lord in its suggestion of eternity. But this advantage is gained at the expense of all the delicate sensitive variations of true drawing and expression.

Romanesque.—Romanesque painting, which from the 11th century developed in Europe, together with architecture, is heir of the Byzantine models. So far as we can judge by the little remaining with us, it followed the Greek tradition in introducing life and movement which were sometimes carried to the point of a convulsive agitation—inherited perhaps from the Byzantine formula. But aside from the faults and strangeness of this art, as may be seen in the frescoes of St. Savin, it lives, and from this life within it flows uninterruptedly along an animated stream embracing every development of modern art.

Mediaeval.—The evolution of the 12th century art might lead one to suppose that France would be foremost in the development of painting, as she was in sculpture and architecture, but Gothic architecture, which here attained the highest degree of excellence, had the effect of reducing the use of paintings because it eliminated a greater part of the walls and replaced them with slender frame-work, giving rise to the invention of stained glass, a magnificent substitute for mural painting. At the same time, in Paris, a school of illumination rivalled that of stained glass in beauty and richness of colour, incorporating a freedom, a suppleness, an investigation of nature and a delicacy of expression impossible to the other medium. (*See* ILLUMINATED MANUSCRIPTS.)

RISE OF EUROPEAN SCHOOLS

Florentine School.—In Italy where Gothic architecture never replaced the Roman forms with their solid and spacious walls it was possible for a genius such as Giotto to develop the art of fresco which led to the rise of the first great school of painting. At the hour of Giotto's birth in Florence about 1266, a French miniaturist decorated the *Psalter of St. Louis* and it is now generally accepted (*see* Van Marle, *The Development of the Italian Schools of Painting,* Hautecoeur, Gazette des Beaux-Arts, 1925) that not only Cimabue but other painters who had belonged to the Roman School of mosaic craftsmen—Cavallini and the Cosmati, Guinta of Pisa, Nicolas of Apulia and Coppo di Marcovaldo—preceded Giotto in the transition from the mosaic to the supple and freer art of the fresco. But Giotto, while of the group, introduced into painting a grandeur of conception and strength of pathetic expression hitherto unknown. The most famous work of the time, after Giotto, was the *Triumph over Death,* which in a mixture of brutality and refinement is an eloquent expression on the walls of the Campo Santo, Pisa.

Siena School.—Another school almost as brilliant, though perhaps weaker and more delicate, developed at Siena, from the same Byzantine source. When the *Madonna of Majesty* of Duccio di Buoninsegna appeared, the whole town, headed by the bishop, lighted candles and sought to carry her in solemnity to the Duomo. In spite of the fact that she was still submitted to the prevailing convention, the public enthusiasm was awakened by the precious novelty which lay in the miraculous gentle smile that animated the features of the majestic madonna.

Simone Martini endowed religious compositions with even more suavity and it was he who first painted other than exclusively religious subjects. On the walls of the Palazzo Pubblico, Siena, he painted the equestrian portrait of *Guidoriccio da Fogliano.* Following him, Ambrogio Lorenzetti became the painter of civic life, uniting the purely Sienese tradition of Simone with the more robust style of Giotto.

With the commencement of the early Renaissance, at the beginning of the 15th century painters in Italy added scenes of everyday life to the religious compositions and began to apply

a scientific study of anatomy. Masaccio (1401–1428), a young genius who died at the age of twenty-seven, showed affinity to the ancient school, but anatomy was his passion and the nude makes its first appearance in art with his *Adam and Eve* in the Carmine, followed by Masolino in his picture the *Baptism of Christ.*

Fra Angelico, the Dominican monk (1387–1455), in spite of the fact that he seemed destined through piety to continue the profoundly religious tradition of Giotto and the Siennese follows the realistic current. But by a sort of special grace, he used his love of nature to express the purest and most mystical soul known in the history of art. Besides this group of initiators whose work was in a certain sense even more classic than that of their immediate successors, who like Botticelli did not escape a certain mannerism, several men of scientific spirit contributed to form the doctrine of the Florentine school which towards the end of the century was destined to become the model for the great geniuses of the Renaissance.

Development of Perspective.—Paolo Uccello (1397–1475) developed perspective and was so delighted with it as to make thereof a sort of mathematical poetry. Others perhaps under the influence of the great sculptor, Ghiberti, strove by incessant labour to perfect drawing by the conquest of the third dimension. Verrocchio, Pollaiuolo and Botticelli, who began as sculptors, carvers, or goldsmiths, added to this drawing which had already become so perfect a sharp metallic precision, a sort of precious hardness. One of their number, the most poetic, Botticelli (1444–1510), conceived better than any other of his time a delightful type of Virgin endowed with a mysterious grace, though at times a little morbid. He translated into painting the dreams of the humanists, and with the *Birth of Venus* and the *Primavera* a new world was revealed to painting.

Outside Florence the complete expansion of Italian art from the end of the 15th century to the first of the 16th century was developed by such painters as Piero della Francesca (1416–1496) at Arezzo. Signorelli, the mighty anatomist, was a precursor of Michelangelo. Antonella da Messina brought to Italy the brutal but expressive realism gained by contact with the Flemish school. Andrae Mantegna (1431–1506), humanitarian, geometrician, archaeologist and great wit, dominated with his imperious personality the whole of northern Italy and formed the link between Florence and Venice, whose school owed its origin to him, through his distinguished Venetian disciples, the Bellinis and Carpaccio. Now classic art is ready to appear.

France.—During this period painting underwent an individual development in the north countries, with France serving as a common ground of understanding. Unfortunately few works other than miniatures have been preserved. The portrait of *Jean le Bon* in the state in which it has come down to us is little more than an archaeological curiosity, but the date, about 1350, is significant, being little later than when Simone Martini in almost the identical spirit and time painted the *Giudoriccio da Fogliano.* Though the *Altarcloth of Narbonne,* with its vast composition in grisaille, including a Calvary, the portraits of King Charles V. and Queen Jeanne de Bourbon, and a series of scenes from the life of Christ show that the Parisian school of about 1375 had already attained a real elegance of drawing, ease of composition and a harmonious mixture of truth and style. Somewhat later, about 1415, the *Tres Riches Heures,* painted for the Duc de Berry by the three brothers de Limbourg, contains veritable little masterpieces wherein genre and landscape are treated with truth and fantasy.

Flanders: Van Eyck Invents Oil Painting.—John van Eyck (1385–1441), was the genius who became the founder of the Flemish school. The inventor of oil painting and a skilful technician, he could paint people, faces, distances, the stones of buildings, embroidered materials, and still life subjects with a veracity and precision hitherto unknown. The reredos of the *Adoration of the Lamb* was painted between 1420 and 1432 and from that moment for a century the Flemish was the dominant art north of the Alps, spreading its influence to Italy. Van Eyck had been in Portugal with Roger van der Weyden, the other pre-eminent master, in Italy. Van Eyck's influence superseded that of the Franco-Flemish on the Rhine, where the Cologne school, during the preceding generation, had shown a graceful sentimental mysticism. To the north, Holland and Germany were conquered, while in France the disasters and miseries of the Hundred Years' War impeded the progress of art. Painters worked at Bourges, Dijon, Avignon and it was in the latter that they met Italians from Siena, summoned there by the Pope. At Dijon they were with the Duke of Burgundy, the enemy of the King of France, an actual possessor of Flanders. Thus resulted a new amalgamation of French and Flemish art toward the middle of the 15th century. Much obscurity still reigns over the question of the relationship between the schools. Of the few important French works preserved, the *Annunciation* of Aix, about 1440, the *Pieta* of Villeneuve-les-Avignon, about 1450, amongst the anonymous ones, and those whose authors are known, such as the *Crowning of the Virgin* by Enguerrand Charonton, and the works happily fairly numerous of miniatures and paintings by Jean Fouquet, justify us in saying that in spite of her misfortunes France had not lost the secret of producing original artists influenced neither too much by other schools nor by one another.

Nothing in the world compares with Van Eyck's picture of an interior with two standing figures known as the portraits of *Jean Arnolfini and his Wife.* It is not too much to say that its extraordinary accuracies and unprecedented imitation of reality have never been surpassed, but the bust-portrait of the painter's wife, a simple head relieved against a plain background, may perhaps compel even greater admiration. From the very first stroke Van Eyck attained an almost unique precision and life, but he was more than a genial precursor of the master realists of Holland; he was the calm theologian composing with the logic and authority of a doctor the multiple symbols of the reredos of the *Lamb* with an even white light on figures which unite the heavenly mysteries with worldly reality.

Roger van der Weyden (1399–1464), whose masterpiece, the *Descent from the Cross,* now at the Escurial, is but a few years subsequent to the achievement of this altar-piece of St. Bavon, is the only Fleming who continued the great conception of the art of Van Eyck, and he added to it a pathos known in his country only in less strength to Hugo van der Goes. The other Flemish artists of the 15th century, dry or full of mannerisms displayed neither inventive nor emotional powers. (*See* EYCK, JOHN VAN.)

THE RENAISSANCE

Italy.—Through the genius of a small number of the most specially gifted mortals, well-nigh universal spirits, Italy reached a goal which resulted in a marvelous influence impregnating the rest of the world with the art of the Renaissance. Leonardo da Vinci (1452–1519) was the first to grasp those facts garnered through two centuries in the gradual conquest of the problems of painting, and, with them, to realize a sort of mystic unity of the real and the spiritual. Finding himself on the borders between scientific discovery and art, this man, at once an architect, sculptor, painter, alchemist and engineer, improved Florentine drawing by applying to modelling with the use of shadow and light that acute subtlety which his predecessors had applied only to outline. In the *Gioconda* and the *Madonna with St. Anne* as well as in other masterpieces the background itself became less a picturesque decoration than an echo of the inner life of a certain element in the total harmony. His picture, no longer a casual mass of detail and episode, became, through the use of the newly discovered laws of perspective, concentrated and organized in line and colour, in shadow and light to the development of a sensitive climax. (*See* LEONARDO DA VINCI.)

Striving to create and interpret the plastic equivalent of passion, Michelangelo (1475–1564), equally universal as sculptor, architect, painter and poet, imbued his art with resistance and force to the utmost limits of expression, at the bidding of his tortured soul. There is little landscape in his painting; all the sentiment, passion and thought of mankind was personified for him in the nude bodies of man and woman. He seldom presented the immobile attitude of repose, whether the figure in marble

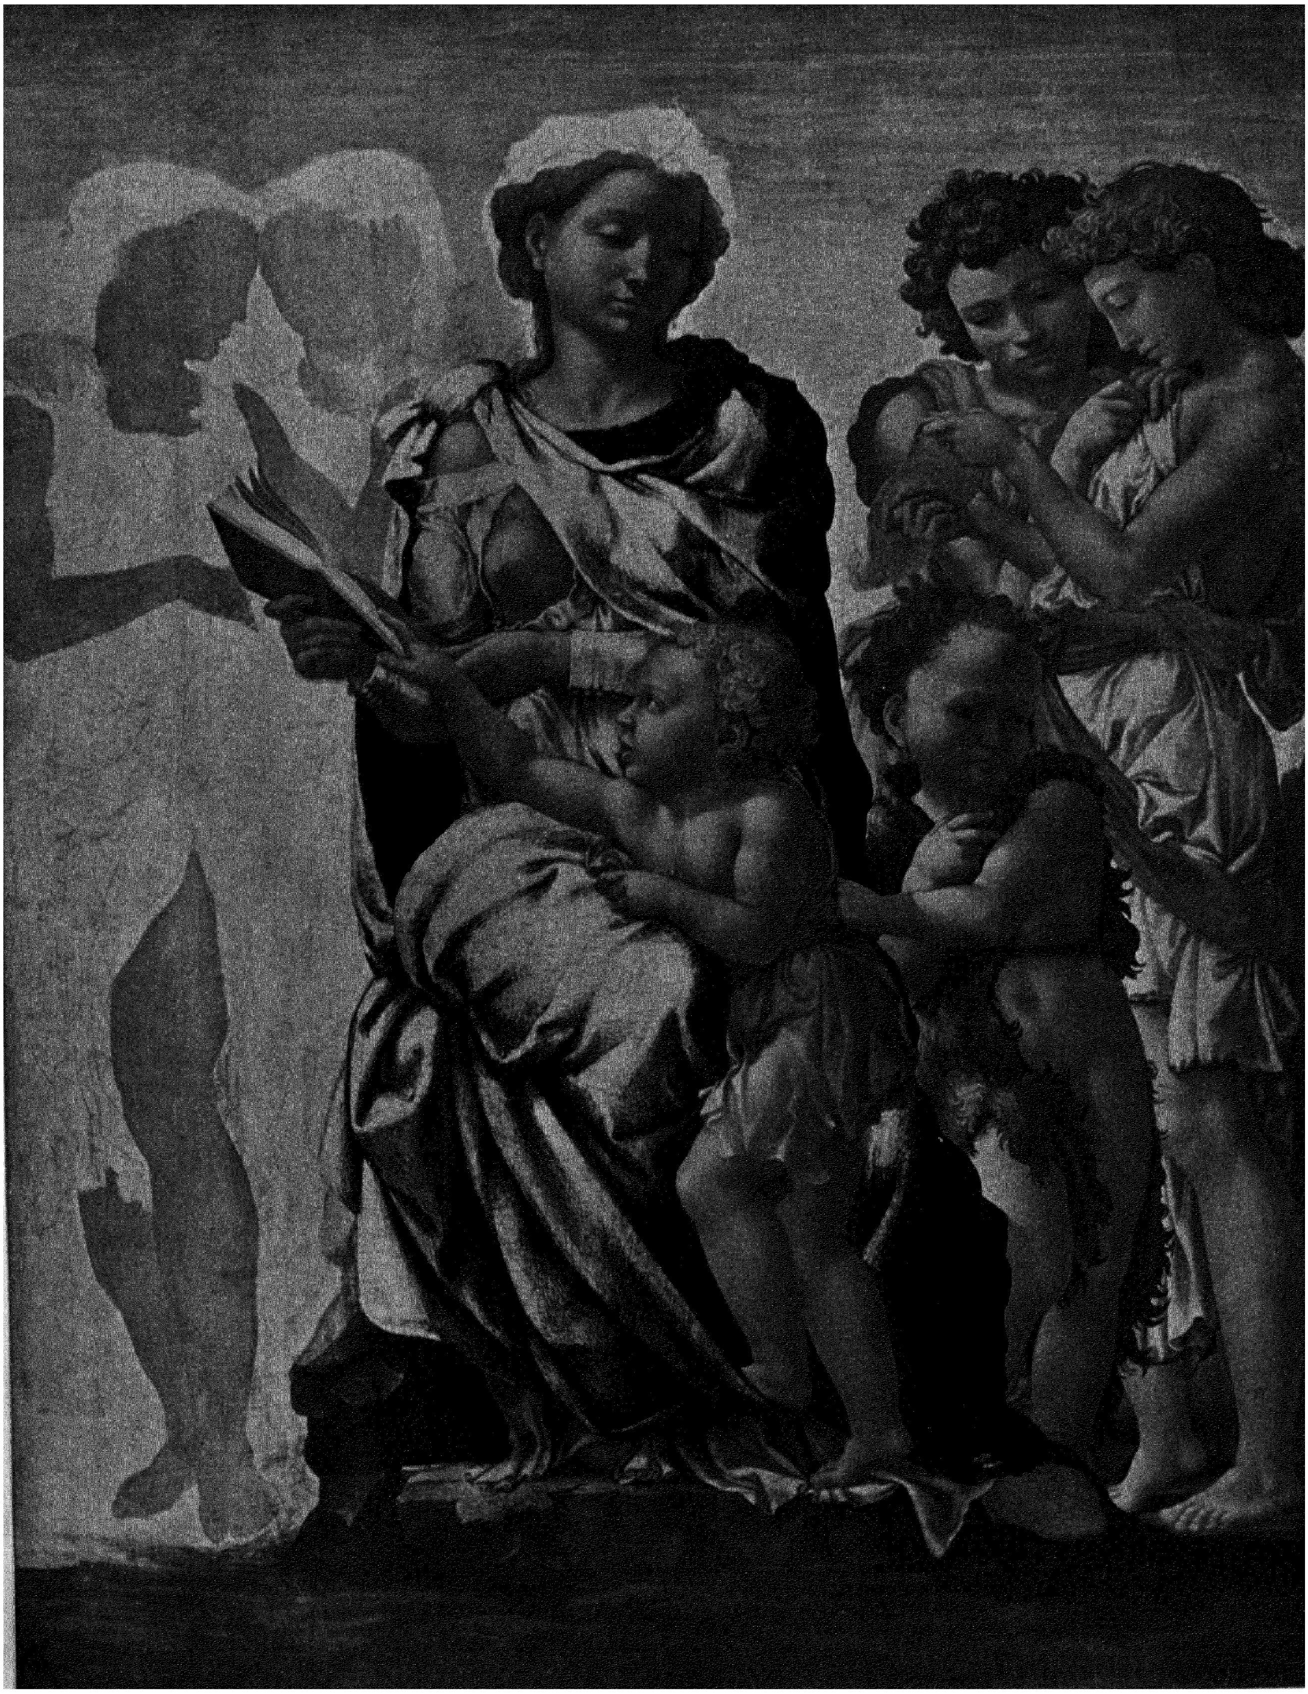
ITALIAN, DUTCH AND FLEMISH PAINTINGS OF THE 16TH AND 17TH CENTURIES

1. "Cumean Sibyl," fresco by Michelangelo (1475–1564), Italian. In the Sistine Chapel, the Vatican, Rome
2. "The Feast of the Gods" by Giovanni Bellini (1430–1516). Venetian School. In the Joseph E. Widener Collection
3. "Marriage at Cana" by Paolo Veronese (1528–88). Venetian School. In the Louvre, Paris
4. "Portrait of Helena Fourment and her Children" by Peter Paul Rubens (1577–1640), Flemish. In the Louvre, Paris
5. "Bohemienne" by Frans Hals (1580–1666), Dutch. In the Louvre, Paris
6. "Laughing Cavalier" by Frans Hals. In the Wallace Collection, London
7. "Lady and Gentleman drinking wine" by Vermeer of Delft (Jan van der Meer, 1632–75), Dutch
8. "Supper at Emmaüs" by Rembrandt van Rijn (1607–99), Dutch. In the Louvre, Paris



MICHELANGELO

"Virgin and Child with St. John and Four Angels" by Michelangelo Buonarroti (1475–1564), an unfinished painting. In the National Gallery, London

happened to be sitting or reclining, whether dreaming, meditating or commanding as those of the Medici tombs, his *Night*, the *Thinker*, or *Moses*, there is a sense of scarcely restrained agitation in his work, but even in the hands of Michelangelo sculpture imposes insuperable limitations, and it was perhaps to escape from these that he became a painter so that he could express those sentiments of his titanic being which were conceived with a sculptor's imagination but which it was impossible to make the marble reveal It was thus that in his work at the Vatican he created the most lyrical and the most epic decorations ever seen in the history of painting (*See* MICHELANGELO)

Raphael (1483–1520) was like Pheidias, who, the Greeks declared, had originated nothing but had brought every branch of art practised by his predecessors to a pitch of perfection and perfect harmony From his master, Perugino, he gathered all of the somewhat limp graces and soft light of the Umbrian school. From Florence he learned the strength and sureness that was Leonardo's and Michelangelo's With fresh rarity he composed on the traditional theme of the Virgin and the Child, painting them with a pure and perfect harmony which only their age-old fame prevents us from fully seeing and appreciating to-day. In his intimate idyllic poetry and air of eternal youth and limpid sweetness, he excludes neither breadth nor majesty of conception. Yet to our eyes even more magnificent claim to honour lies in his conception and realisation of the frescoes with which, from 1509, he decorated the "Stanza" and "Loggie" of the Vatican That sublimity which Michelangelo attained seemingly by fury and passion, he achieved by a sovereign balance of intelligence and sensitiveness: *La Disputa* and the *School of Athens*, the portrait heads, of which there are no finer examples among the works of the most famous professional portrait painters, have the suppleness of gesture, the bright life enveloping a composition all animated and dominated by the fundamental idea

Rome became not only the artistic capital of Italy but of the entire world. Artists from every country made pilgrimages there to worship the ancient capital now reborn in classic art (*See* RENAISSANCE ART)

Germany.—In Germany the greatest artist born north of the Rhine absorbed only a stimulation from the Italian influence which served to enlarge the breadth of his natural imagination Albrecht Dürer (1471–1528) had genius great enough to protect itself as did also Mathias Grunewald, in his tormented dramatism so profoundly Germanic; and Durer, almost comparable with Leonardo, stood on the borders of two worlds, that of the Gothic and that of the modern age, as he did on the borders of two arts, that of the engraver and that of the painter.

Holbein (1497–1543), born in Augsburg and living successively in Basle and England, which gave him a cosmopolitan viewpoint, attained a prodigious realism of a trenchant and precise drawing together with a certain Italian elegance which made him a remarkable portraitist

Holland.—Holland was nearly as extensively influenced as France, but not being welded together by a monarchic power permitted more individual liberty to the artist Quentin Metsys (1466–1530) was conducted by Fouquet, founder of the Antwerp school, to the art of humanism with grace and naturalness. Bosch (1450–1516) took from Italy only a curious element of contrast in the complex course of his fantastic visions, and Pieter Brueghel (1526–1569) in his unbridled humour and lively animation seemed to preserve some Gothic inspiration surviving the Italian influence.

Venice.—After the deaths of Leonardo and Raphael, and while Michelangelo still pursued his career, Venice prolonged with more brilliance Italy's glory, dimming and disappearing in the older schools, and the last great Italian painter was a Venetian of the 18th century, the dazzling decorator, Tiepolo. The first Venetian masters, the Bellinis and Carpaccio, resembled the robust and severe Mantegna, but they quickly turned to the development of the expression of colour and light and the conception of the figure in relation to the landscape with which they made an absolutely new art out of the magnificent decoration which had originally sprung up in Italy. Churches and palaces had been decorated with the same grandeur and splendour because the same religious sentiment manifested itself more or less openly in both. Now, on the contrary, a species of pagan pomp reached even the paintings destined for the churches. For some time, indeed, a human wind had been blowing in; even in the days in which the painters treated only religious subjects, they were seen little by little, in the pictures ordered by the kings and princes, to be choosing for subjects those Bible stories, which allowed either nudities of amorous or voluptuous character or array of magnificent costumes—Salome, Susan, Judith, Bathsheba—and in truth when Diana, Venus and other Olympian divinities began to appear they found the ground all prepared Nevertheless, it is a mistake to imagine that religious sentiment was absent from these sumptuous compositions of the Venetians It was only the tone of the sentiment that had changed Thus, painting, since its modest and fervent beginnings under the shadow of the church progressed in disengaging itself more and more from the didactic rôle originally given it and ceased to preach

Bellini's delicious and tender madonnas, like those of Titian, at times so homely, such as the *Virgin with the Rabbit*, at times so majestic, like the *Madonna of the Frari*, whose glances were ever lowered affectionately on the faithful spectator, have inspired and accompanied many a prayer Tintoretto, surrounded by dazzling colour harmonies of Venetian painting, retrieved the pathetic sense of religious drama, but Veronese seemed to be interested only in grouping beautiful young women and noble senators adorned with silks, brocades and golden chains, and indeed the day came when the Holy See questioned the fitness of such an assemblage of worldly appearance beside the Son of God; but Veronese when questioned said he had put it there to look well and satisfied the tribunal These Venetians were incomparable decorators and the least that can be said of their pictures is that they stirred the souls of the faithful by predisposing them to adore the divine It is also interesting to note that reclining nudes were among the original creations of the Venetian school and particularly those of Giorgione and Titian, in contrast to the Florentine nudes usually standing and so delicate and precise in their outlines as to resemble at times the precious work of the goldsmith, or, at others, marble statuary.

From his earliest days Giorgione (*c* 1477–1510), that genius who died at about the age of 30, treated feminine beauty amidst the beauty of nature in a conception at once both poetic and human On the number of canvases the subjects, such as the *Painter's Family* and the *Sylvan Concert*, are enigmatic, but thereby stir our imaginations all the more Titian developed the same theme in his own way and Bellini painted the noble and delicious *Feast of the Gods* (1514, in Widener Collection, Philadelphia), which already contained the germ, or more than the germ, of Titian's *Bacchanalia*, who later used it in variations in the pictures, *Three Ages of Man* (Bridgewater House, London) and *Sacred and Profane Love* The painter demonstrated he could dispense with the appearance of the mythological fables which remained in Bellini's pictures but which had already been eliminated by Giorgione; beautiful nude figures and others in rich fashionable costumes are assembled without any apparent reason before a vast landscape where our eyes see a mysterious reflection of the painter's thoughts and dreams Thus from Venice came our poetry of the nude, the landscape, and the composition of figures in a landscape—one might almost say three-quarters of modern painting

Eclectic Schools.—Between the Venetians and Rubens, their most legitimate heir, came the Eclectic schools of Italy, including no great geniuses but exercising a considerable combined influence In Spain these schools influenced the definite orientation of a group that had until this time followed several paths, and in the rest of the world they took a temporary premier place

Like a beautiful flowering branch broken from the great Venetian tree, Correggio, who was an initiator, a brilliant decorator, a colourist and harmonist, invested with a delightful beauty such immense compositions as those in the Parma cupola, as well as some of the finest Italian paintings, such as *Jupiter and Antiope*, the *Marriage of St Catherine*, and the *Venus, Mercury and*

Cupid. He had a natural affinity with Titian, Leonardo and Raphael, whose work he recalled. His instinctive example suggested to the Carracci the analytical doctrine applied by the founders of the Bolognese school.

Later Phases of Italian Painting.—Francesco Raibolini (Il Francia) known as the founder of the Bolognese school, whose masterpiece is believed by many to be the *Virgin with Infant Christ and St. Anne enthroned* created a style general all over Italy formed from the finest elements and founded on the great masters. Ludovico (1555–1619), Agostino (1557–1602), and Annibale Carracci (1560–1609) founded their celebrated academy in 1589. If they were partly responsible for what was afterwards called academic art, meaning formed by learned formula, their personal work is far from being negligible. They had ambition and strength enough and were great decorators. The Farnese Gallery is proof thereof, and their pupils Guercino and Domenichino may be looked upon with equal esteem.

The real original talent of those times, however, rose apart from the schools. Michelangelo da Caravaggia (1569–1609) invested his paintings with as much temperament as he did his disordered life. He painted still life, which meant painting for the pleasure of painting quite apart from the subject. This again was something new in art, and he also brought into great religious subjects his robust naturalism, violent contrasts of crude line and opaque shadows, and a taste for unusual and striking scenery, thus forming a picturesque though not undignified style.

In the following generations the most talented painters oscillated between the lesson of Caravaggio and that of Carracci. It was the romantic Salvatore Rosa and the prolific Luca Giordano who by their brilliant compositions on church walls and palace ceilings seemed to announce the coming of Tiepolo, but Venice even in this last period of her splendour still retained the same independence which had distinguished her golden age. The academic could not cool her fire nor the influence of Caravaggio dull her palette.

In the middle of the 17th century amid a surrounding decadence which she alone in Italy escaped, Venice produced inventors in the painting of manners and of landscapes such as Antonio Canaletto (1697–1768) and Guardi (1712–1793) while Piazzetta, a virtuoso of the brush, showed in his excellent pictures a more modern freedom and accent than was attained during the 19th century. Tiepolo (1696–1770) was a decorator in the grand manner of Veronese with less brilliance and less refinement of colour but with luminosity and atmosphere. His masterpiece, the *Story of Antony and Cleopatra*, on the walls of the Labia Palace, reveals his romantic sentiment and essential gaiety.

FLEMISH SCHOOL

Rubens.—In the Prado Museum there are two pieces of painting between which there is a remarkable resemblance—the *Adam and Eve* by Titian and the copy of it by Rubens (1577–1640), who intended his work to be a scrupulously faithful reproduction; however, if the original were missing and we knew nothing about it the copy would be accepted as an authentic composition of Rubens' own, so much is it imbued with the characteristic qualities of this great Flemish painter. In this painting Eve has become one of those beautiful women of Antwerp whose delightful fairness and pearly delicate skin make us forget the occasional heaviness of their forms and whose beauty is so often epitomised in the likeness of his beloved Helen Fourment whom Rubens never tired of introducing into his compositions. To complete the reflections suggested by these examples, the Brussels Museum shows another very curious example. On the same wall one can see the *Miracles of Saint Benoit*, a large composition by Rubens, 1628, and a copy a little reduced which Delacroix painted when, in 1838, preparing to paint his *Entrance of the Crusaders into Constantinople*, he went to consult in the place where Rubens had worked and lived—this man for whom, of all the heroes of the secret Parnassus he had raised in his heart, he felt the most enthusiastic and constant admiration. These two landmarks symbolize in some degree the expanse of a mighty, happy and easy genius who showed the way for the future two centuries.

Humanist in the manner of the great men of the Renaissance, and, as none has ever been after him, anxious to know all and understand all, entering more than any of them into the big affairs of the day, possessing his prince's confidence and only using it on his diplomatic missions to work in those troubled times with true Christian ardour for peace, Rubens was one of those rare mortals who are really an honour to mankind. He was handsome, good and generous. His laborious life was well-regulated. The creator of so many delicious pagan feasts attended mass every morning before entering his studio. He was the most illustrious type of happy and perfectly balanced genius. He conciliates within himself passion, science, ardour and thought. He was a good and honest husband, youthfully in love with a good and charming wife, and, after her death, with a delightful, fair child-woman who with her smiling youth brightened for ten years some of his most beautiful and personal compositions. With these two virtuous loves he created an unexampled cycle of lyrical joy running through a procession of happy nudities, laughing faces and loosened hair, but he expressed drama as well as joy, for nothing human was foreign to him, and he gave, when he wished, a pathos of colour and expression, to such allegories as the *Horrors of War* as well as to his religious masterpieces, the *Descent from the Cross*, the *Road to Calvary* and the *Crucifixion, le coup de lance*. (*See* RUBENS, PETER.)

Van Dyck.—There is not often to be seen a closer resemblance between the master and his disciple than there was between Rubens and Van Dyck, or on the other hand a resemblance which allowed so much freedom of conception in the disciple, this being, in other words, an example of the forming of a great painter by a great master genius. Van Dyck inherited in drawing as in colour Rubens' marvelous ease and his touch had at times a charm and elegance unknown to his master. But this facility was not as with Rubens the instrument of a great and encompassing intelligence, though he endeavoured to amalgamate Italy and Flanders and did at times in certain paintings succeed, more particularly in his canvases of *Madonnas, Holy Families* and *Calvaries*, and his *Descent from the Cross* as well as a few mythological compositions. But Van Dyck's fame rests more securely on his portraits which surpassed those of his master in elegance and aristocratic strength rivalled only by the great English painters of the 18th century for whom he set an example. The *Portrait of Charles I.* in the Louvre is unique in its sovereign elegance.

Van Dyck, beautiful as a woman, was fanciful, nervous, capricious, and his precocity was irresistible beneath this charming surface. He was cold, hardened and much disillusioned; his life was a perpetual festivity. He travelled even more than Rubens and was appreciated everywhere. In 1632 he found the country of his choice and attached himself to the court of the Stuarts, realizing a sort of pre-established affinity with England, and in time he became the greatest exponent of English painting. He died at forty-two, exhausted, only two years after the death of his master, Rubens.

Around these two masters there worked a number of excellent painters from the city of Antwerp, who since the first years of the 16th century settled at Bruges, the centre of Flemish art. Several of them helped Rubens in the execution of his large decorations, such as the *Life of Marie de Medici*. Snyders and Paulus de Vos, among these, were excellent animal painters; Fyt was a still life painter. Cornelius de Vos (1585–1651) was a remarkable portraitist, more interested in expressing the truth than in revealing himself. Jakob Jordaens (1593–1678) had a forceful temperament and in contrast with the aristocratic Van Dyck he developed the vein of exuberant good health which is to be found in their master, Adam van Noort. He sometimes confused force and verve with vulgarity, but in his inspired days his painting came very near to greatness, lit by a fine healthy nudity such as may be seen in the *Child Jupiter* at the Louvre and *Fecundity* at the Brussels Museum. David Teniers (1610–1690) found in Rubens (*Kermesse*) the elements for his portrayal of dancing and drinking peasants and delicate landscapes, but his joviality is taken a little for granted and his observation inclined to be superficial, turning easily to caricature; however, his sureness of

AN EARLY VELASQUEZ

"St. John in the Wilderness" by Diego de Silva Velasquez (1599–1660), one of the finest examples of the Spanish painter's early period. It may be dated, according to authorities, about 1620, when Velasquez was twenty years old, and before he went to Madrid in his ambition to become court painter. The figure is life size, outlined against a dark landscape; a diffused nimbus glows behind the head, detaching it from the dark mass of the tree in the background. The golden tone of the flesh, which is characteristic of Velasquez' early manner, is accented by the red-violet drapery. The painting, which has passed through many hands, was at one time in the Spanish collection of Louis-Philippe of France, and hung for several years in the Louvre. It came later in private ownership to England and is now exhibited at the Art Institute of Chicago as an anonymous loan

touch, the transparent quality of his colour, both brilliant and fine, deserve unqualified praise, and it is his landscapes, especially with his delicate greens and silvery light, which are outstanding. Jan Siberechts (1627–1703) shows less skilful execution and less agreeable colour, but in his peasant pictures he showed a more original and sincere observation of country life than Teniers. Adrien Brouwer (1605 or 1606–1638) whose life was short and disordered, did few works and he painted mainly tavern subjects similar to the subjects of Teniers and his followers and landscapes which remind us of Rembrandt's. (*See* VAN DYCK, ANTHONY.)

HOLLAND

In Holland at this time there was a tremendous development in art which put in a sudden appearance and which was quite different from what might have been expected from its rather confused beginnings. From the last part of the 15th century until the end of the 16th century the Dutch were not easily distinguished from the Flemish; the painters treated the same religious subjects in the same manner. Gerard of Haarlem (or more correctly, Van Sint Jans) (1465–1493), to whom can be traced a few authenticated works, was almost the only one of these North Flemish primitives of outstanding merit.

In the generation following, Lucas van Leyden (1494–1533) was truly original and his portraits are almost as incisive as those of Albrecht Dürer, who was his elder by twenty years. Like Dürer also, he was more of an engraver than a painter. Images were forbidden in the churches of the Reformation and this meant the end of religious painting, and the naturalistic current which since the Renaissance had spread through the world, reigned from that time on in Holland without obstacle or compromise. There were no more commissions for painters from the king, court or church. The painters had only a republican people to please, and paintings were therefore for elegant, rather small houses and their themes were portraits, landscapes, and genre, thus preparing and introducing to a great extent the program which followed. Official civic art existed only in the form of collective portraits showing groups gathered around a table, a banqueting or council board, the town magistrates, professors, syndicates of a corporation, or the officers of a company of volunteers. Frans Hals (1581–1666) was the first to win distinction, immediately followed by the great Rembrandt and then by Van der Helst (1613–1670). The individual portrait painters include besides these masters some able workers: Mierevelt, Morales, Ravesteyn, Thomas de Keyser and Bol. (*See* PORTRAIT PAINTING.) Within the limits of a revolutionary prosaic conception the Dutch took a high place and showed a perfection of craft perhaps never surpassed. Perhaps the original idea of painting such subjects as card players, drinkers, concerts, and merry companions, which were multiplied indefinitely for more than two centuries originated with Caravaggio and indeed the unity between Italy and Holland is seen in the person of Gerard van Honthorst (1590–1655), who lived many years in Rome where he was called Gherardo della Notte, and who brought back to his country two or three themes borrowed from his master Caravaggio as well as the taste for effects of light either natural or artificial in interiors. But the Dutch painters soon abandoned the decorative and romanesque intentions of the Caravagesque Honthorst and sought only to reveal the truth and to obtain recognizable likenesses of subjects of domestic life, such as scenes in the kitchen or the dining room, incidents of the streets, or of the country; of the seashore and of the sea itself, which was naturally of great interest to this nautical people. Frans Hals painted little else but portraits and he was the first of a school which produced in so short a time a number of talented men.

Landscape art had been brought to a high degree of accomplishment at the time when French miniaturists were illustrating *Tres Riches Heures* for the Duc de Berry; later the Venetians in works of a new richness and rhythm had come close to nature and at this same hour painters such as Ruysdaels, Van Goyens, Van de Veldes, Hobbemas, Wynants, Paul Potters, Albert Cüypes and Van der Heydens flourished; Poussin at the same time was adopting the Venetian idea and adding to it more universal sovereignty. It was reserved to the Dutch to make for the first time in the history of western painting masterpieces of subjects furnished by their native land and with no other apparent ambition than an exact representation of ordinary things, previously judged to be too uninteresting to merit the attention of an artist. The part they took in innovating *genre* pictures was not less great, though the first inceptions may be found among the Flemish primitives such as Van Eyck's painting of *Arnolfini and His Wife*. Therefore, the great painters of Holland, who include Adrian van Ostade, Pieter de Hooch, and Vermeer of Delft, hold a unique position in the field of art and may rank with the most illustrious.

Vermeer.—These essential traits that we attribute to the mass of Dutch painting apply to most of the painters but others soared above the well-defined limitations. Rembrandt, Hals, Steen and Vermeer are the great original geniuses of Holland. Vermeer (1632–1675) is the only one answering to the idea we have of the Dutch national placidity. The impression is that he pursued his task slowly but with an unfailing sureness, and that he took as much interest in painting a reflection on a decanter, a tapestry on a wall, or the material of a carpet or dress as in painting the faces of women and men. No apparent virtuosity, no display of brushwork, no attempted style, but everything brought to a perfection and maximum of photographic effect in accuracy, his cold blues, his pinks, yellows and grays—making rare original creations. Vermeer's women are generally doing nothing but standing or sitting in a room divided by shadow and light; sometimes they are writing a letter or touching the strings of an instrument, and even though the composition contains several figures there is no drama and sometimes no perceptible subject. However, these women make us dream, and we do not forget their mysterious seductiveness. One must go to Corot to find a similar appeal, and one almost as difficult to explain. The explanation is not to be found in the fact that this kind of painting was conquered and practised for its own sake, nor because of the personal quality (such as that of Corot in his pictures the *Vue du Forum, Roma*); but the *Little Street* and the *View of Delft*, wherein a prodigious accuracy is inexplicably arrived at, embody a sort of subtle poetry.

Steen.—In the three other great painters of the Dutch school it would be difficult to discover the least sign of placidity. With Hals and Steen all is movement and even agitation. Their painting might be described as boisterous. Before the *Feast in an Inn* and many other of Steen's pictures (1626–1679), one can almost hear the heavy thumps on the backs of the drunkards who are jostling each other, their shoes stamping the ground; and sonorous bursts of ribald laughter, while a musician blows hard enough to burst his lungs into an instrument which seems almost silenced by comparison with the infernal charivari. His work was very unequal, but when he was inspired he lavished on the licentious scenes which he loved to paint of popular inns or more elegant surroundings, harmonies of brilliant colour and a vigorous touch. He was a satirist and moralist in the manner of old Brueghel and Hieronymus Bosch and he had something of their fantastic imagination.

Frans Hals.—Similar observations apply to Frans Hals (1581?–1666) the oldest of the Dutch painters of the 17th century except that moral intentions were entirely foreign to him and they were the more significant in that his manner and taste for action had not much room in which to expand, for when he painted a portrait of some rich and important person how could he permit himself to indulge the impulses of his own fancy? It is the same in those groups of the *Arquebusiers of St. George*, or the *Saint Adriaen* which made him famous. Hals, with his prodigious ease, his impressive direct brushwork, his gift of conjuring up with broad strokes a living being in all his reality; the expressive movement in the faces, the restless eyes, the speaking mouth or the hands about to seize an object! He did not forget in those civic pictures the broad treatment of the garments and the picturesque quality of the flags, the folds and stripes of which made such attractive backgrounds, but he was certainly at more ease when painting the popular models which inspire such fanciful figures as *La Bohémienne* in the Louvre, the *Lute Player* now in Robert de Rothschild's collection, and the *Hille Bobbe* at Berlin. These fanciful figures seen half-length are certainly derived

from Honthorst's concerts and Caravaggio, though Hals was surely a portrait painter infinitely superior to both, and is unequalled in everything pertaining to pure painting.

Rembrandt.—In spite of the mysterious and august peace which pervades some of his religious compositions such as the *Pilgrims of Emmaus,* or the *Carpenter's Home,* Rembrandt (1606–1669) had little trace of the Dutch placidity. Everything was mysterious, his mind, character, life, work and methods of painting and what little can be guessed through his paintings and the incidents of his unhappy life, evokes troubled and generous ideas, of contrary impulses emerging from the depths of his being as the light and shade emerged from his pictures Yet his life has a fusion identifying intelligence with thought and heart, just as in his painting there is a fusion of many varied elements It seems that his sentiment, broad, free, hardy and unaware of any encumbrance induced in him the most varied meditations which resulted in the unprecedentedly pathetic and unparalleled character that he impressed on all that he painted no matter what the subject There is much unevenness in his work, however, and the inspired sublimity which was such a man's natural vocation could not possibly be a daily occurrence This singular and strangely attractive, at the same time almost enigmatic personality seems to have developed very slowly He showed early talent and an original outlook on the world as is proven by his youthful etchings and the first portraits of himself, as early as about 1630. It was some time, however, before he could find in painting the means of expressing the special things he had to say, and many years before he arrived at that bold, broad and personal expression which we admire in the masterpieces of his maturity and which in his day in spite of all his subtlety were considered coarse, and only acted to estrange him the more from the public In his early painting he adopted a somewhat smooth style little different from that afterwards used by the little masters of his country and which ended by degenerating into minute feats of skill of which Gerard Dou's are the best examples. If Rembrandt had left us only those large, full-length and costumed portraits that made him successful with the rich burghers of Amsterdam or even such celebrated pictures as the *Lesson in Anatomy of Professor Van Culp* (1632), he would no doubt rank among the most excellent painters, but he would not be the man in whom we salute a prophetic recluse, the creator of a new language translating pain, pity, kindness and all the contradictions in the lives of the disquiet human being

From the beginning light played an important part in his conception and he made of it the principal instrument of his expression For him it constituted the poetry of human phenomena when he painted his meditating philosophers, or that *Holy Family,* so charmingly shown in its modest intimacy, and previously called the *Carpenter's Home,* or the *Angel Raphael Leaving Tobit* (both in 1637); but after these he enlarged on it

The *Night Guard* (1642), marks at the same time the height of his reputation and the beginning of his downfall. The important persons—the officers of the Civic Guard who commissioned this great canvas—intimated by the giving of the commission that they considered him capable of rivalling Frans Hals' famous corporate portraits Rembrandt thereupon took it for granted that he had sufficient authority to break away from the rules of genre painting He had already done portraits richer in deep humanity than the more superficial and lifelike ones of Hals and he felt the need of some imaginary or fanciful treatment to relieve a theme which seemed to him too prosaic. Apart from such enigmatic figures in the picture as the little girl carrying a cock (or at least from those which he gave an enigmatic appearance, for this little girl resembling an apparition simply held the prize for the soldiers' shooting match), he had a warm inspiration which was entirely misunderstood and with it applied for the first time that instinct which has in a manner transfigured all of his paintings, even those of the most ordinary subjects. As Fromentin who better than anyone else has realized the essence of Rembrandt's methods has said, the conception consisted of "illuminating an actual scene with light that did not exist—that is to say, giving to an event the ideal character of a vision," and with the painting of this picture Rembrandt realized the full extent of his own abilities Not attempting to paint light for its own sake, as the impressionists did later, he used it like an instrument so that when properly projected it expressed the invisible and the imponderable. No, he did not love light for its own sake or shadow for its mystery, for, to quote Fromentin, "All emerges into a bath of shadow; light itself is plunged therein except when it is extracted to appear far off, more radiant, surging in dim waves around bright centres, shading them, piercing them, rendering the darkness more or less transparent, the half-light easy to penetrate, giving, indeed, even to the strongest colours a sort of permeability which prevents them from being black." And in this use of light and shadow it was not the method which he loved but its result in the portrayal of weak, tortured and miserable humanity, a divine and human figure appears to those who have the eyes to see and mingles with the vicissitudes of the life of the humble; the figure of Christ who bends over the wounds of soul and body, healing and pardoning, and saying "Remember, I have a gentle and humble heart " It is no small honour to Rembrandt to have evoked a few features, and those not the least, of our Saviour's countenance: infinite bounty and compassionate pain. It is no exaggeration to say that after the Primitives, Rembrandt was, with El Greco, the most religious of painters, while at the same time being perhaps the most humane He had pupils, disciples, imitators; a few of them were talented—Nicolas Maes, Govert Flinck, Ferdinand Bol, Gerbrand van der Eeckhout, Aert van Gelder, Jan Lievens Carel Fabritius is an exquisite painter, but though one of Rembrandt's pupils, is nearer to Vermeer. None of these can be compared with Rembrandt, for at their highest they reached only the level of his least good and least personal work

In the pursuit of such a new and difficult ideal, half-failures are inevitable and for that reason misfortune cast its shadow over Rembrandt's genius He was not the sort of man who should be asked to work to order and that is why the rather ordinary portraitist of the great burghers of Amsterdam up to about 1640 became the admirable, incomparable and ceaselessly renewed painter of those many pictures he has given us of himself, and above all that tragic representation of his old age the *Rembrandt with the Silk Handkerchief* in the Louvre and that one in which goodness mysteriously shines in a beautiful maid's features, his faithful friend, Hendrickje Stoffels. All his work was uncompromising, nay almost bald in its truth, and yet with him the true was inseparable from the imaginary Not once did he paint those real life subjects that formed the repertory of his Dutch fellow painters, but he did paint the *Slaughtered Ox,* an almost repulsive object from which all the still life specialists would have recoiled in horror, and in fact this painting is such that even Chardin, the best of still life painters, could not have conceived it. He had a universal curiosity and he saw, meditated, dreamed, and painted withdrawn into himself. Everything he derived from truth, and even the works of others became under his hand instantly transformed into the substance of his own thought. But with the constant, indissoluble, though undeliberate mingling of the imaginary with the true, we are continually being reminded of Shakespeare in his first masterpieces, though Rembrandt's are pure plastic creations without a shadow of literature.

After this magnificent efflorescence, at the end of the 17th century there appeared the first signs of the decadence in Holland which the 18th century completed through the trivial ideal of minute execution which ended in dryness and insipidity

SPAIN

Those years of the 17th century which showed such enormous progress in Flemish and Dutch art also brought into line with universal art a school which had until this time stood somewhat apart. There is much obscurity on the subject of origins of painting in Spain. Catalonia was apparently the principal home of art in the 13th, 14th and 15th centuries and it was here that artists first worked under the sole influence of the French miniaturists to which was added later the influence of the Sienese and still later the art of the Flemish. Until the extreme end of the

15th century, works gracefully and finely executed, such as those of Jaime Huguet (whose name seems to indicate a French origin), show that in the midst of a general production, apparently, but really a continuation of Flemish painting, there existed at least in Barcelona a certain style derived from France. The 16th century in Spain as in Flanders was the epoch of romanticism, and artists who were more theorists than painters adopted a cold scholarly combination of Flemish realism corresponding with the inclination of Spanish imagination and the classical models of the Italian Renaissance.

It is curious that the 16th century man who seemed the most authentic representative was Antonio Moro (1512–1575), who, born in Holland, was known as Anterony Mor van Dashorst, and who, patronised by the courts of Brussels, London and Madrid, painted portraits admirable in truth and dignity such as that of the Duke of Alba.

El Greco.—Another brought to Spain an art which reflected her own mystic and chivalrous spirit. The Cretan, Domenico Theotocopoulos, called El Greco (1545–1614) had studied in Venice in Titian's studio, and his first works showed the mark of their Venetian origin and the influences of Correggio and Michelangelo. He arrived in Spain about 1580 and was soon established at Toledo. Doubtless there was a mysterious affinity between this belated Greek who seemed to retain in his imagination the heretic figures with the distracted eyes of the Byzantine mosaics, and this town, the veritable heart of religious and military Spain where all was ardour, mystery, and a kind of passionate austerity. In Venice El Greco had preferred the dramatic tormented inspiration of Tintoretto to the balanced conceptions of his master, and when he went to Spain he came straight to the city whose monuments and soil to-day appear as though torn by internal drama. He lived the life of an eccentric gentleman painting spasmodically and perhaps it is because of this abstraction that his work holds a species of fascination; and though he appears more mediaeval to us than most authentic primitives, much of his work seems to express the pure essence of art and the specific attitude of the artist. What has been almost sensuous feeling to painters of the 19th century was to El Greco the soaring of the soul, and in spite of the spiritual abyss between the two principles, the plastic results are much the same. Perhaps no one has appeared more indifferent or disdainful of material truth. His figures, disproportionately elongated and twisted, ignore the most elementary rules of anatomy and in spite of the portraitist sense in him the construction of his faces is no more correct. He twisted lines and colours to his despotic fancy, but if after conceding these rights of criticism one is content to observe, the spell of his extraordinarily unique art works upon us and those undulating lines tending toward the vertical, along with the colour in which black and white predominates, impoverished by a kind of aesthetic will, make us perceive that all moves toward an extraordinary intensity of expression. Those strange lines in truth have the trembling elevation of a prayer or ecstasy and they form a marvelous melody upheld by this colouring as of an evening sky over which enpurpled clouds float silvery pale with yellow flashes of lightning and green glimmerings. This man, unable to exist by ordinary laws, was, when he cared, by some miraculous paradox, a portrait painter, and he invested with ardent life, livid visages in which never a drop of blood circulated. His *Crowning of the Virgin, Assumptions,* and *Resurrections* show him to be the only painter who has ever really unfurled celestial visions before dead eyes, and painted them as if he actually saw them, and in the great canvas that was his masterpiece, the *Burial of the Count d'Orgaz,* he realized as no one had ever done before, or may ever do again, harmonies and reactions that appear quite natural, between supernatural and earthly things. Below, a corpse nearly doubled in two in his black steel armour is supported by two saintly beings descended from celestial abodes. Courtiers in sombre and severe costumes are grouped around this miraculous scene, and the painting of all, including the dead man and his blessed pall-bearers, is real and like portraiture. Above them, the irradiated firmament opens and there Christ and the Virgin await the departing spirit while angels with huge curved wings come and go between the region of eternal life and this earth. One feels that this marvelous picture appeared suddenly to the artist's imagination in all its daring composition.

An almost uncompromising realism, paralleled by a spontaneous mysticism, were the two poles of Spanish art, and though the realism at times seemed to predominate, a sort of mystic vibration was never wanting. We see this later in several great painters representing diverse regional tendencies: in Valencia—Ribera (1589–1652); at Seville—Herrera, the Elder (1576–1656), and also Zurbaran (1598–1662), who came under the Italian influence, Ribera being at the beginning a real Neapolitan, called Spagnoletto. Indeed he returned to Naples to die, albeit to a Spanish Naples governed by a Castilian viceroy. Zurbaran went to Rome, but with all of these artists the national temperament was so strong that there was no danger of reviving the 16th century adventure or that of the Romanists. They did not adopt academic formulae from the Italian models but turned to the masters of naturalism, particularly Caravaggio, and each applied his own style to every subject, whether religious, profane or popular, showing a disdain for the conventions which imparted a new outlook to traditional themes. There was something inexplicably crude, even brutal in their vision of reality, and always a feeling for the picturesque and the drama latent in life's spectacles. The celebrated *Franciscan* in the National Gallery shows how Zurbaran, the best balanced and most idealistic of the three, arrived at an extraordinary intensity of spiritual expression by realistic means as much in the individual character of the half-visible face under the monkish hood as in the striking rendering of the fustian robe and the violent contrast of light and shade from which he drew in turn realistic effects of tragic horror as well as suavity, for this frenzied imagination, served by an infallible science and a prodigious virtuosity of the hand, conceived the painting of ragamuffins, beggars, the squalid, dwarfs, and cripples with every human deformity, not in fantastic compositions as the examples of Bosch or Brueghel, but as isolated figures occupying the whole canvas and presented in a manner that until then had been reserved for kings and princes; he infused a sort of cynical verve, a partly harsh, partly fraternal sentiment, that is not without a masculine breadth, and these conceptions no doubt satisfied some obscure predilection in the Spanish soul, for they persisted for years following. The *Club-foot* and similar works of Ribera can claim kinship with the popular types of Velazquez, with Murillo's beggars and many grimacing or burlesqued figures by Goya, and their descendants are to be found even in certain youthful works of Manet. Doubtless the image of suffering was relieved by the idea of the heroic martyrdom authorized by the love of God, but it cannot be denied that Ribera took a sort of savage pleasure in spreading before our eyes scenes rendered with unprecedented precision, of flowing blood, twisted limbs, exposed entrails, victims being flayed, or tortured with red hot pincers, dismembered or burned alive. Polomino (1653–1725), painter and historian, tells us that the picture now in the Prado Museum in which Ribera represented Ixion attached to the wheel and tortured by a dreadful demon, was the cause of a premature confinement of a noble lady who had it before her eyes in a room. However, this same Ribera sometimes took pleasure in conjuring up from black depths the tender figure of a saint with luminous body, and he, nearly alone of the Spanish school, painted the nude. (*See* RIBERA, JOSÉ.)

Velazquez.—Velazquez (1599–1660) owed much to these excellent painters. When in 1629 he visited Ribera in Naples he must have felt gratitude though he only passed by Herrera; and though he was not the pupil of the frenzied Spagnoletto his youthful works show the obvious influence of Zurbaran. His master, who later became his father-in-law, Francisco Pacheco, was not very talented but was a scholarly connoisseur unusually cultivated. If we allow for the differences between the Spanish gentleman, with graceful reserved manners, and the exuberant son of Flanders, the life and career of Velazquez as well as the part he played in the art of his country are reminiscent of Rubens—both represent a magnificent expansion following a period of fruitful preparation;

both were the favourites of the princes of their time and led brilliant lives. Court functions occupied an even greater place in Velazquez's existence than in that of Rubens. At the age of twenty-eight he was an officer of the chamber. From 1624 when he received the title of painter to the King until his death he never quitted the court except for two tours to Italy at intervals of twenty years and even these tours were official missions. He filled many ranks of office which were by no means sinecures and which involved very absorbing work, and he died a grand marshal of the Palace and Chevalier of Saint James. In fact he may have been prouder of these honours and of the king's friendship than of his genius. He admired El Greco and even possessed a few of his canvases. He met Rubens when that master visited Madrid and like Rubens himself he studied the great Venetians whose masterpieces ornamented the royal palace. But all of these advantages would have been insufficient without the gift of genius. One has the impression that this extremely intelligent passionless artist, this highly accomplished example of civilized man, had an almost limitless power over his faculties. He commenced by learning the principles of his craft; he exercised eye and hand by working in the manner of Zurbaran at still-life studies and pictures of popular types and succeeded with wonderful ease. He was only nineteen years of age when he painted that *Water-seller of Seville* which is in the Duke of Wellington's collection, London; the distribution of light and shade, the true and natural attitudes of the types, the theme both sober and rich, all is perfect, and from that moment it was evident he was destined before everything to be a great portrait painter. If one insists on finding an excuse for criticism one might perhaps say that even though the three personages of the picture are perfect their perfection is eclipsed by that of the two "alcarrazas," earthen water-coolers placed in the foreground. Never have there been seen in painting two pitchers so marvelously realistic and they are done with ease and great breadth. Hê might have remained content with such results and have pursued, with the aid of his scholarly craft so early acquired, the development of his personality but a short time after his arrival at Madrid and as soon as he was appointed painter to the King (1624) he changed his style. He resolved, by a deliberate act of intelligence and will, upon that easy and rapid execution in which it seems that by the same stroke the brush renders form, expression and light; a really incomparable style, close to perfection in painting, incorporating the rare quality of satisfying both the public and the connoisseur. A canvas by Velazquez, particularly a head painted by him, since he was first of all a portraitist, makes an immediate appeal even to the spectator least versed in the secrets of the art, in its effortless life and simple, striking effect; whilst the initiated who know the mysteries of the painter's art may delight in the wonderful science, the subtlety and refinement. Velazquez would have been the last to deny that he owed much to Rubens and many generations of painters have consulted both, but nowhere could be acquired a technique of painting comparable with that of Velazquez. It seems that this man to whom everything was easy except the expression of passion, doubt, or agony, considered with a calm mind the various obligations of life. His reason for adopting the new technique was undoubtedly a necessity caused by the short time he had for painting, because his life was becoming increasingly involved in the king's service. Manet has said, as had many others before and after him, that Velazquez was the painter's painter.

A few murmur, "Yes, one can see that he was an incomparable painter, but this amazing imitator of life had no imagination," and these severe censors may be right if they refer to the faculty of plastically translating legendary themes and mythological fables, of composing allegories and depicting winged creatures on the sky of a ceiling, or perchance those who fly without wings and whose gestures have nothing in common with terrestrial habits; but it seems imagination, and of a kind best suited to a painter, to evolve with a restricted palette an entirely new scale of colours, full of distinction, fineness and strength, on which he can play with the infallible results of an accomplished musician. These sober and refined harmonies which were very personal to him contribute towards the particular impression which we feel before Velazquez's masterpieces, whether they be portraits or compositions in which the portrait is always the essential element. The truth impresses itself upon us with such force that we are tempted in the vividness of the sensation to accuse all other painters, even the greatest, of falsehood—poetic falsehood, pathetic falsehood, and all the most beautiful forms of falsehood, if you will, but nevertheless falsehood. However, if the picture takes possession of us it is not merely because it shows us that which our eyes under certain circumstances might have seen had they been trained to see, but because it opens before us an unknown world created by art before which we all stand speechless, holding our breath as though before some magic apparition.

Velazquez's portraits of the king, the infantas, princes and lords were often repeated and in none of these did he attempt to do away with individual awkwardness or peculiarity as does the average portrait painter in a mood of flattery, but by virtue of the supreme elegance and distinction which are innate in him he avoids offense. His portraits are charmingly attractive, imposing or disquieting, and they intrigue us indefinitely, like enigmas. Perhaps he did not entirely succeed in his few attempts at religious painting, but in these again can be observed the original trait of his personality. If his *Coronation of the Virgin* may be to some extent reproached with coldness the composition is of a perfect and original elegance, and the type of Mary is like no other. His *Christ Crucified,* now in the Prado, suffices and is perhaps the most beautiful modern representation of the subject simply conceived and painted with the most scholarly craft. Another great artist, Goya, less perfect but more passionate than Velazquez one day thought himself great enough to rival the master whom he nevertheless profoundly admired. His *Christ* in the same museum in spite of his charming subtleties appears both flabby and vulgar as compared with that of Velazquez.

Finally, three important compositions put the seal on Velazquez's fame; his originality is entirely proved, as well as his sovereign elegance by *Las Lanzas,* or the *Surrender of Breda, Las Meninas* and *Las Hilanderas. Las Lanzas* was an official picture commanded by the King in honour of a military event considered glorious to the monarchy. It filled exactly the same function as, a little later, the canvases of Van der Meulen glorifying the pageantry of Louis XIV. But without belittling the faithful picturesque annalist, Van der Meulen, there is a world of difference between his work and this noble composition with its delicate pervading light, its chivalrous air, these noble portraits and this blue and silver sky crossed by the barrier of lances, which make it the finest historical picture in existence. *Las Meninas* and *Las Hilanderas* are still finer. His own personal technique in the development of these subjects makes them very different from what they might have been if handled by one of the little Dutch masters who would at best have translated them into some agreeable genre picture. There is some secret probably due to those years of study and technique which in itself does not suggest anything calculating or contrived. These two big canvases representing, one a corner of the tapestry factory of St. Isobel, and the other, a room in the Royal Palace with Velazquez himself painting the portraits of Philip IV. and his second wife, Maria Anne of Austria, are unique works; they are, in their way, without precedent and unrivalled in later days, including enough material to provide endless lessons to the succeeding generations of painters. In the foreground of one the spinners are occupied with their work while in the background under a quite different light and in a different plane, deer, whose presence seems accidental, have just entered the factory and gaze on the tapestry representing themselves. The whole gives a sort of fairy-like sense of apparition without being marred by any discord or feeling of incongruity. In the other picture the whole foreground is occupied by three elegant and charming figures: a little infanta, stiff in her rich attire, and two ladies in waiting pressing forward to serve her. In the shadows are two dwarfs and a big dog. It is usual to call the picture *Las Meninas,* even though the supposed subject is that of Velazquez painting the portraits of the king and queen. Velazquez is indeed there, but

in the second plane and in shadow, the back of the huge easel before him cutting the whole left of the composition. It is not easy to find the august models. In the background in the depths of the chamber under a light subdued by the window curtains there are, side by side, two bright rectangles, one lighter than the other, which come from an open door on a staircase in which is standing a man turned towards us and a mirror in which is reflected the far-off image of the king and queen posing for their painter. We are confronted with the enigma of this painting in its subject and intention, or apparent absence of intention, but his art re-acts on us as a magic evocation of truth and light.

Good painters continued in Madrid for some time under the impulse given by this master. Velazquez's son-in-law, Mazo (1615–1667), to whom is now attributed the charming little picture in the Louvre, *Meeting of Thirteen Gentlemen,* and Carreño de Miranda (1614–1685), who was a good portrait painter, were of them, but a great genius does not found a school, and twenty-five years after Velazquez's death art in Madrid had faded into mediocrity. (*See* VELAZQUEZ.)

Murillo.—It was in the south, in Seville, the birth-place of Velazquez that during his time he met a rival in Esteban Murillo (1617–1682) and to contemporary eyes the latter may have appeared even the more admirable of the two, for his popular sentimental art was much better calculated to touch the heart of the public than was the lucid, intelligent, unemotional and infallible mastery of the painter of *Las Meninas.* But in truth he was rightly admired with enthusiasm and gratitude by a pious Spain to which after the reign of the great court painter he gave an art which expressed in simple language the tender ecstasy and adoration of an innocent and profound faith. He, too, following Zurbaran, began by painting in a realistic manner, which he did not entirely abandon even later in those roguish subjects which he found in the streets of Seville. The *Young Beggar* of the Louvre and other pictures in the same style are enough to show us on what a solid foundation of observation his ideal creations rested. His first compositions were pious, such as the *Miracle of San Diego* in the Louvre. He found a way of uniting in a harmony that has all the appearance of spontaneity, a realistic execution with mystic sentiment. Therein lies one of Murillo's greatest merits. Perhaps in the past his *Immaculate Conception* in the Louvre was overrated, but one should not exaggerate one's criticism in the negative direction. Murillo was one of the most suave painters of the Madonna we have seen, besides Velazquez, who might be compared to Raphael. Murillo holds about the same rank as Andrea del Sarto and after him decadence came quickly. Only Valdes Leal (1630–1691), with his dramatic talent which sometimes bordered on the horrible, stood out against the vapidity that invaded religious painting. In the 18th century in Spain there were only second-rate French painters summoned there by the Bourbon kings, the German, Raphael Mengs, a good portrait painter, and for a short while, Tiepolo, the last of the great Venetians who came from Italy to decorate the Royal Palace, and who died in Madrid. (*See* MURILLO.)

Goya.—Goya (1746–1828) had an entirely different type of temperament from that of Velazquez, and in his personal style is unequalled. It is through him that the fine Spanish tradition, which for nearly a century and a half almost disappeared, was renewed. He was less perfect, less sovereign but infinitely more varied. No effect that could be attained by means of painting was unknown to him and all of his inequality was the result of extreme fecundity. He was as original a draughtsman, etcher and lithographer as he was painter, but unlike Velazquez he did not arrive easily at mastery. At first he abandoned himself to a life of pleasure at any price. In spite of his unrestrained coarseness, his strong personality, gaiety and humour attracted everybody. Though he was married and his wife gave him twenty children he was to be found anywhere but at home. He frequented both bad and good company; he became the lover of the Viranas and he eloped with the Duchess of Alba. Then, having quarrelled with her, he revenged himself by mocking her in drawings and paintings, insolently, impudently and cruelly. But everything was forgiven him. At the age of thirty he was painter to the king and an academician, though had he died at the age of forty it is possible he would not have left a single one of the works which made him famous. That is a significant fact, for this impulsive man, therefore, we may believe, was a thinker. He was of those who, being born to create a new form of art, have no other masters than themselves and their own experiences in life. He was one of the three great geniuses of Spanish art and even more than the great Velazquez he reminds us of the most illustrious name in his country's literature, Cervantes, because of the blending in the works of both of them of lyricism and grotesque pathos and satire. Like Greco and Velazquez, he was an admirable portraitist. One might even go so far as to say that portraiture was the basis of his art; that even in his works of pure imagination the understanding of character peculiar to the portraitist persisted everywhere. It was so in the two typical masterpieces of Greco and Velazquez, and the *Family of Charles IV.* brings this out strongly, for it seems only a collection of portraits, a good-natured old king, a queen with the bearing of an imperious sorceress, princes and princesses of all ages loaded with silk, velvet embroidery, necklaces and precious gems. The animation of the brushwork, the sparkling and mysterious colour scheme so entirely new, are in themselves sufficient to distinguish this unique composition, but all these admirable inventions of the colourist and virtuoso are stripped of half their beauty if we do not perceive, first and foremost, all the brilliant and subtle variations on the tragi-comic theme of human psychology. Goya renovated and innovated everywhere; whether working for the churches or painting political pictures, he was always doing the unexpected. His cartoons for tapestry show that he had studied Boucher and Fragonard; but there was nothing conventional in him. In the scenes he painted—gallant, joyful or dramatic—everything—costumes, types, attitudes—has an accent of convincing realism. His constantly renewed inspiration found a fruitful field in his little genre pictures, though the term is inadequate to describe these little masterpieces of invention, observation, emotion, and irony. In *La Romeria de San Isidro,* a landscape unique in its time, as much for the fine clearness of its atmosphere as for the free spiritual and precious notation of the hundreds of tiny figures on foot, horseback, or driving, sitting, eating, drinking, speaking or gesticulating, we get the illusion of being in the middle of this Madrilenian crowd on a public holiday on the borders of the Manzanares. Then there are the carnival scenes, like the *El Entierro de la Sardina* and street processions like the *Flagellants,* interiors of prisons and lunatic asylums, and so many other subjects, strange, melodramatic, romantic, anecdotal and satirical which are a constant surprise and revelation. If we wonder how such subjects would have been treated by other painters we appreciate the more what this magician has done with them by producing such marvels of fantasy and mystery. There is something nocturnal in the imagination and sensibility of Goya as there is in the colour he employed. The etchings, *Los Caprichos* and *Desastres de la Guerra,* give this impression to the point of nightmare, and the same quality can be found in certain of his portraits. It is not merely because one of these two pictures represents an execution at night by the light of a lantern that we are impressed by that feeling in those two pathetic works inspired by his country's misfortunes: the *Dos de Mayo* and the *Tres de Mayo* (the Charge of the Mamelukes and the Fusillade). In spite of the luminous and voluptuous lights of the flesh tints it is again this nocturnal atmosphere which pervades these two celebrated figures of *La Maja Vestida* and *La Maja Pynuda.* This extraordinary man was the author of the most beautiful nude existing in Spanish painting, and to complete the universality of his genius, this profligate and libertine had his hours of Christian inspiration. The *Last Communion of St. Joseph of Calasanz* is perhaps the most beautiful religious painting executed during the 18th century. It palpitates with emotion, reminding one of Rembrandt. But never does the mystery come, as with Rembrandt, from a source of light flowing from the shadows, but from the infinite gradations of a grey twilight—once more a nocturne. For San Antonio de la Florida, Goya provided his religious and decorative masterpiece. The ecstatic angels robed like court ladies and singing like beauti-

ful cantatrices are more of his most delightful inventions. Never has anything been seen similar to these greys and blacks which play the part of the bass "sotto voce" in a clear, airy harmony. Nocturne, always nocturne. Goya was the father of the 19th century art and of all modern art. In his place he left only one clever imitator, too servile but with a certain animation, Eugenio Lucas (1824–1890). In France are to be found his best and most faithful followers. At the 19th century court, however, apart from the brilliant but dry narrow art of Fortuny, one felt that Spain always held the germs of possibilities capable some day of favouring the production of a great painter. (*See* Goya, Francisco.)

FRANCE

The first part of the 17th century was in almost all countries a time of varied geniuses including many of the greatest originality. What remarkable chance unites by date such masters as Caravaggio, Rubens, Van Dyck, Rembrandt, Hals, Velazquez, Ribera, Murillo, Poussin, Claude Lorrain, and Le Nain. If the word "Renaissance" had not in France the special meaning belonging to the great classical Italian movement and its consequences it is to the 17th century that it should be applied. The 16th century marked the period of stagnation in painting. Only Italians or Italianized Flemish of the first and second Fontainebleau schools seem worth mentioning. Authentic French taste could be found in the little portraits of the Clouets, Corneilles of Lyons and their disciples. How can this eclipse of creative genius be explained? The fact is most singular in so brilliant a reign as that of the Valois whose leader merited the name of Father of Letters and Arts. Did Francis I. and his successors summon the Italian painters to France because France no longer had talent to offer or, on the contrary, was it the king's personal preference for Italian art that sterilized French genius? The first hypothesis seems the more probable, for despite the lack of painters the sculptors and architects show a remarkable originality. Strange enigma that painting alone should have fallen so low in a country that produced Ronsard, Rabelais, and Montaigne, the architects of the castle of the Loire, the sculptors Germain Pilor and Jean Goujon!

Simon Vouet.—It was the artists so strongly influenced by Italy who, after a long sojourn beyond the Alps were the founders of this Renaissance in France. Simon Vouet (1590–1649) was extremely precocious. At fourteen he had already such a reputation as a portrait painter that he was invited to go to England to paint a portrait of a lady of quality. He had similar success in Constantinople where he was attached to the French embassy, in Venice, and in Florence where he received the title of Prince of the Academy of St. Luke, and lastly Genoa where he decorated the Doria Palace. Recalled to Paris by Louis XIII. in 1628 he was covered with honours, and for twenty years he exercised a sovereign power over the arts, decorating palaces, churches and castles. To-day most of his decorative works have disappeared and his glory is almost forgotten. We look at him through Poussin's eyes and Poussin, not loving him, saw in him only the father of academicism. Doubtless he let himself be carried away by his facility but his light palette and decorative feeling have played a part in the evolution of French painting. He had much more influence than Poussin himself on Le Sueur, Le Brun, and Mignard and consequently on the work of Louis XIV.'s reign—the decoration of Versailles. Boucher derived much from him and through Boucher a large part of the 18th century art as well.

Poussin.—Poussin (1594–1665) was but four years younger than Vouet but his influence was not felt until considerably later; he was one of those great men who required time for thought and meditation and whose inspiration came only with maturity of mind and body. Knowledge of Poussin's career dates from about the time of his arrival in Rome in 1624 to study Raphael. He was not disappointed in the master of the Farnese, but Titian was a revelation to him and from that moment he seemed to have sought to reconcile the spirits of these two great artists. Applying the theory expressed in his celebrated letter to Monsieur de Chantelon, he appeared to have alternated between two magnetic poles, at one time favouring the linear element derived from Raphael, and at another the warm colourful atmosphere which was Titian's. To-day this dual admiration appears natural to us, but this was not the case in 1624 when the artists, gathered together in Rome, understood only the academic art which sprang from the Bolognese and the brutal naturalism of Caravaggio. Poussin detested the one as much as the other and with his philosophic frankness condemned them unconditionally. Of what seemed to him empty virtuosity he accepted only Domenichino on account of his seriousness and modesty, and because he believed him to be nearer to Raphael than to his brilliant colleagues. Thus this indefatigable champion of classicism was in reality original and independent.

Going to Rome to study, he venerated and adored the Eternal City, its monuments, the surrounding country and its imposing history, understanding this city better than the Italians themselves for in it he saw in his imagination the descendant of Greece, a sort of golden age, he thought, of poetry and human art. Thus the love of antiquity, in spite of all the scruples for accuracy he imposed on himself, was for him not a pretext for vain and cold aping of archaeology, but a source of living, new poetry. The only man who can be compared with him in artistic expression so influenced by the love of antiquity is Goethe. It was the memory of Titian and Giorgione which inspired him to new discoveries. He was one of the greatest landscape painters known in the history of painting. His drawings made in the course of walks in the Roman countryside or done from memory in his studio can be compared with the finest of Claude's and, in the opinion of the writer, are even superior. Some are done with two or three strokes of the pen and a few touches of wash, reminiscent of the quick notes of Turner. With a background of fact, seized with emotion and neatly defined, Poussin painted landscapes such as the marvellous Homeric and Virgilian poem which is the setting of his *Polypheme* and the Elysian glades that contain the dancing processions of his *Bacchanals* or shade his sleeping nymphs. Like Titian, Poussin found in nature things corresponding with the thoughts and passions of men, though he was inferior to the great Venetian in richness of palette as well as in sureness and purity of form.

Claude Lorrain.—Claude Gelée, called Claude Lorrain (1600–1682), was not so great as Poussin but his genius cannot be denied and he was an original inventor in the classic manner. He lived nearly all his life in Rome, but was not over-influenced by the Italian painters. In his essential personal quality he created the French landscape, and for more than two centuries all those in France who have sought to express the beauties of nature have thought of Claude and studied his works. Among them were Joseph Vernet in the 18th century, as well as Corot in the 19th. Outside France it was the same and in England among many enthusiastic disciples were the great landscape painters from Richard Wilson to Turner. There is mystery in the vocation of this little almost illiterate peasant who knew French no better than he knew Italian and who made notes on his drawings in a queer language all his own.

What attracted him to Rome and what held him there? Could he not have painted in Nancy, Paris or elsewhere, his *Village Fairs, Aeneas Hunting the Stag on the Coast of Libya,* or even his *Cleopatra Disembarking at Tarsus,* his *Enchanted Castles* and *Sea Ports?* For this admirable painter drew most of his pictures from within himself, though he worked from nature at times, and in his pictures the imaginative side predominated more and more, in proportion as he became conscious of his own genius.

His first masters were the German, Wals, and a Florentine, Tassi, pupils of Adam Elsheimer, and they transmitted to Claude the doctrine of this man who, though not a great painter himself, was the first to paint landscapes wherein a radiation coming from the depths of the shadows formed the center of interest, if not the whole significance of the landscape. Elsheimer's was a great destiny and he was less honoured for his talent than for his ideas—ideas which though not entirely expressed in his own paintings showed the way to both Claude Lorrain and Rembrandt. When Claude Lorrain started he had rather a timid style; the leaves of his trees were painted with a minute finish and were somewhat

hard. It was Poussin who freed him from his shackles while they lived almost next door to each other on the Pincio, and this quick absorption of the lessons of Poussin perhaps indicates that this illiterate dreamer had more intelligence than might have first been suspected. Listening to Poussin and watching him paint, he grew to understand that a sort of intellectual background would add to his dreams and visions, and from that time, about 1639–40, he composed his most unforgettable masterpieces, the *Sea Ports,* a combination of water and sky and light transforming them in a frame of noble buildings which resemble no actually known spot.

Besides these two great painters a wealth of original French artists came into being during the first part of the 17th century, repaying her for the sterility of the preceding century. Poussin held an incomparable prestige, but his influence was remote and, with the exception of his own disciples, Gaspard Dughet, called le Guaspre, and Jacques Stella, served only as an inspiration. When one sees the intellectual and classical simultaneously arising in literature it is easy to believe that the painters would have followed this trend even without the influence of Poussin, but the general influence of his dominating genius set an example to all but a few of the painters who died too young, or for some other reason escaped its inspiration, such as Valentin de Boulogne, called le Valentin (1591–1634), who like Poussin spent nearly his whole life in Rome with plenty of opportunity of seeing his great colleague's work but who preferred that of the realistic, violent, brutal Caravaggio, whom Poussin had refused to recognize. Apart from his skilful and robust execution le Valentin's picturesque scenes, the *Inns* and *Card Players,* interest us mainly because they form a link between Caravaggio and the Le Nains.

Jacques Blanchard (1600–1638) was another who did not succumb to Poussin's influence. Dying young, he has left us only a few brilliant examples, such as his *Cymon and Iphigenia,* in the Louvre, inspired by the Venetians but still French in character.

The French school has always possessed good portrait painters perhaps because of the national inclination for the establishment of precise fact. In the 16th century when the future of painting in France seemed jeopardized, portraiture alone continued to live. Later, at the end of the 17th century when academic convention threatened to stifle any originality, Largillière and Rigaud painted pictures, full of life, strength and beauty, of the princes, great ladies and magistrates of the time. Two men who follow each other in succeeding generations, Philippe de Champaigne (1602–1674) and Robert Nanteuil (1625–1678) were not brilliant painters like the former, but as portraitists or recorders of fact they were superior in the seriousness and gravity of an art which disdained embellishments. Philippe de Champaigne, born in Brussels, was only nineteen when he went to Paris. His work, completely imbued with French spirit, showed traces of the advice which he received from Poussin and he was another of those who profited by the master's genius without the slightest loss to his own personal style. He was strongly influenced by his religion, and his admirable portrait of *Cardinal Richelieu* and of the gentlemen and nuns of the Port Royal, besides being essentially French, have left to us invaluable documents on Jansenism. Inspired by paternal and religious sentiments, he painted in a bare cell a picture of his daughter, *Sister Catherine of St. Susan,* cured in the presence of Mother Agnes Arnauld by the miracle of the Holy Thorn, which is an austere and moving masterpiece unique in the history of painting. (*See* PORTRAIT PAINTING.)

Nanteuil was more draughtsman and engraver than painter, and there is not a single oil painting which can be absolutely authenticated as coming from his brush. This matters little, however, since with his pencil, his pastels, or his engraving points he has produced portraits, particularly of men, which are among the finest and most profound in the history of art. His pastels are of such merit as to have established him as the precursor of the brilliant school of French pastellists of the succeeding century. His portraits were only heads, but what concentration of emotion and insight he could apply to the drawing of an eye, the crease about a mouth, or the wrinkle in a forehead!

Although some years earlier Jacques Callot (1592–1635) was another engraver and an independent draughtsman of genius; there are no pictures in oils that can be attributed to him with certainty, which is a surprising fact when one sees what real pictorial qualities he put into his etchings, and when one notes that it is those painters, who are so entirely painters, Watteau and Goya, who seem long afterwards to have best remembered his lyrical masquerades and his *Miseries of War.*

Sebastien Bourdon (1616–1671) is a sort of Proteus of painting. He imitated Poussin, the little Dutch masters, and the Bolognese. Indeed he imitated everyone available, with intelligence and brilliant facility, but in his self-portrait in the Louvre, or Touquet's at Versailles, or the *Portrait of an Unknown Man* at Montpellier he imitated no one.

Eustache le Sueur (1616–1655), born in the same year as Bourdon, died before attaining the age of thirty-nine. He had a less brilliant but more engaging personality; his sweetness, attaining a delightful suavity, seldom becomes feeble, and he was truly original in all his art. A pupil of Vouet, he made frequent use of the light tonality learned from his master which was an outstanding feature in an age when a dark palette was generally in favour. The candour of his tender pious soul as that expressed in the 15th century manuscripts may be seen in his picture *The Virgin Appearing to St. Martin,* very much akin to the feeling and spirit of the paintings of Fra Angelico, a feeling of religious emotion unique in the works of the time. In his series of pictures of the *Life of St. Bruno* and in the charming decorations he did for the Lambert Mansion, *Love's Bower* and the *Chamber of the Muses,* there is the freshness of the primitive in colour and innocent grace.

Had Poussin ever seen a picture by the brothers Le Nain, he would doubtless have passed it by, and it is sure that he would have felt that his biographer, Felibien, honoured them too greatly when speaking of them in his descriptions, thus: "The Le Nain brothers painted portraits and scenes, but in a style of little nobility often representing simple subjects and without beauty." But these simple pictures portraying the lives of peasants, which appeared to lack beauty during those days, we find to-day serious and full of a modest and penetrating poetry. To divide between the three brothers' works, which had come down to us under the general signature "Le Nain Pinxit" for a long time seemed impossible, but the writer believes that he helped a few years ago toward the solving of the problem. Antoine le Nain (1588–1648), pupil at Laon of a "foreign painter" (probably Venn of Flanders), composed little panels in a style and with a palette more or less derived from the Flemish, in which were assembled in modest interiors groups of people of the middle classes, rather than rustics. His style, though a little archaic, one can readily see, shows the love of humble truth which is the source of inspiration in the most original and beautiful works signed by these brothers. Louis (1593–1648) was the man of genius. It was he who, between 1640 and 1648 painted those gatherings of peasants around their tables, before their houses or in their fields, which are expressed so frankly and with so much dignity and understanding of humanity and which are notably different from those painted of similar subjects by Italians and the followers of Caravaggio, as well as the Spaniards, the Flemish and the Dutch. Mathieu (1607–1677) had less depth, although his work shows him to have been almost as good a judge of human character. He preferred family groups drawn from the higher classes in the same rustic surroundings.

After this generation of original and independent men, it might be said that the social state of French art changed under the influence and patronage of an absolute monarchy. King and nation were united. The French believed the best way to promote their glory consisted in working for the honour of their king and thus in 1648 was inaugurated the French Academy in Rome, an act of Colbert's inspired by Le Brun at the instigation of Louis XIV. When the young king saw the magnificence which Le Brun accomplished in decorating the castle of Vaux-le-Vicant for Superintendent Fouquet, he realized that here was the man he required Charles Le Brun (1619–1690) really possessed few of the qualities that lovers of painting most prize. Though he had done some excellent portraits and good pictures, ingenuously composed in

various styles, none of them give us the satisfaction, or inspire us with the emotion that more apparently modest works are capable of doing. Nevertheless, his place in the history of art is great, and curiously this father of academicism executed a work which can only perhaps be compared to the construction of cathedrals of the middle ages, and to the great works of the Acropolis under Pericles and Pheidias. At Versailles his was the master mind commanding an army of architects, painters, sculptors, goldsmiths and upholsterers, showing that he possessed a genius for decoration, of which the Gallery of Mirrors at Versailles and the Gallery of Apollo at the Louvre are glorious examples. Supported by the royal confidence for twenty years he reigned over the empire of art.

Pierre Mignard (1610–1695) on returning from Italy, where he had been brilliantly successful for twenty-two years, tried to contest Le Brun's leadership in a personal rivalry, though not one of doctrines, for both were equally hide-bound in Italianism, and while claiming to be followers of Poussin they were really more influenced by the Bolognese. Both were clever but Le Brun had the energy, ambition and foresight of a leader and one can well perceive the value of his conception when his disagreeable colour schemes and impersonal touch is replaced by a material beautiful in itself. There are few tapestries more beautiful than the series of the *History of Louis XIV*. When Le Brun was no longer there to animate the troop of painters, upholsterers, etc., an immediate lack of his uniting personality was felt, similar to the almost parallel phenomena, one hundred and twenty years later, when the pupils of David, another painter of despotic temperament, lost his rule. Happily for France, however, no sooner did Le Brun disappear than the reaction against Italianized academicism manifested itself in the quarrel between the followers of Rubens and those of Poussin. Poussin's name was wrongfully evoked by the supporters of Le Brun. A part of the French school discovered that there were ideals better than these Italian ones, that colour had as much value as drawing and that grace, intimacy and freedom are elements of art as well as nobility and grandeur. Jean Jouvenet (1644–1717), Antoine Coypel (1661–1722), and Charles de la Fosse (1636–1716) were pupils and collaborators of Le Brun, but in colour and sentiment the proclaimers of the 18th century. The portrait painters also followed the movement and Jean de Troy (1645–1730) painted animated and delightful portraits. Hyacinthe Rigaud (1659–1743) added to him virtuosity and often grandiose composition without injury to the statement of facts or the expression of his style as is seen in the celebrated portrait of Bossuet. Nicolas de Largillière (1656–1746), who was born in Paris, studied at Antwerp and later in London with Sir Peter Lely, was an excellent technician and vivid colourist in the French style. Nattier (1685–1751) was less veracious and painted amiable princesses adorned in mythological disguises, translating into painting the decorative style of the Regency.

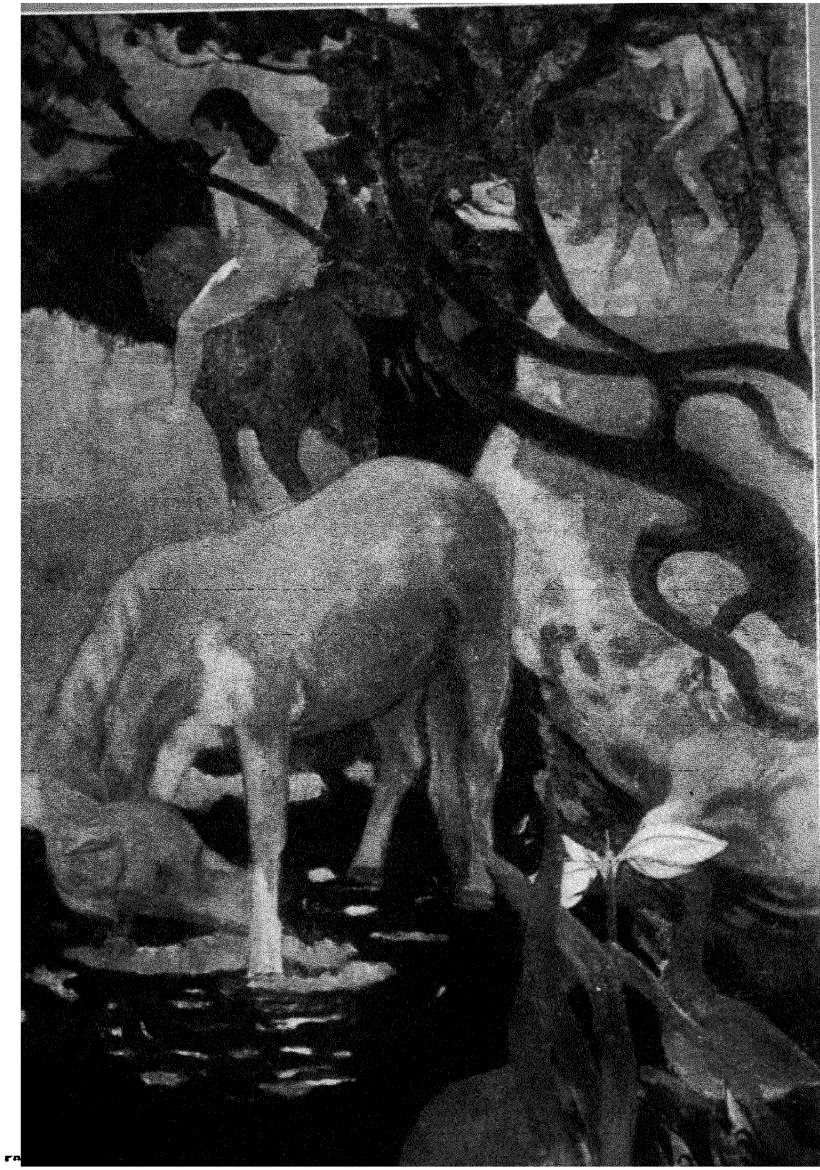
The animal painters, Desportes (1661–1766) and Oudry (1686–1755) adapted to this style Snyders' hunting subjects, the greatest merit of which in our eyes lies in the very modern feeling they had of landscape. In Largillière's masterpiece, the *Painter's Family*, the sky behind his charming daughter who is standing with a roll of music in her hand, her eyes raised, singing, reminds us of Watteau, as well as of the romantic quality in some pictures by Charles de la Fosse.

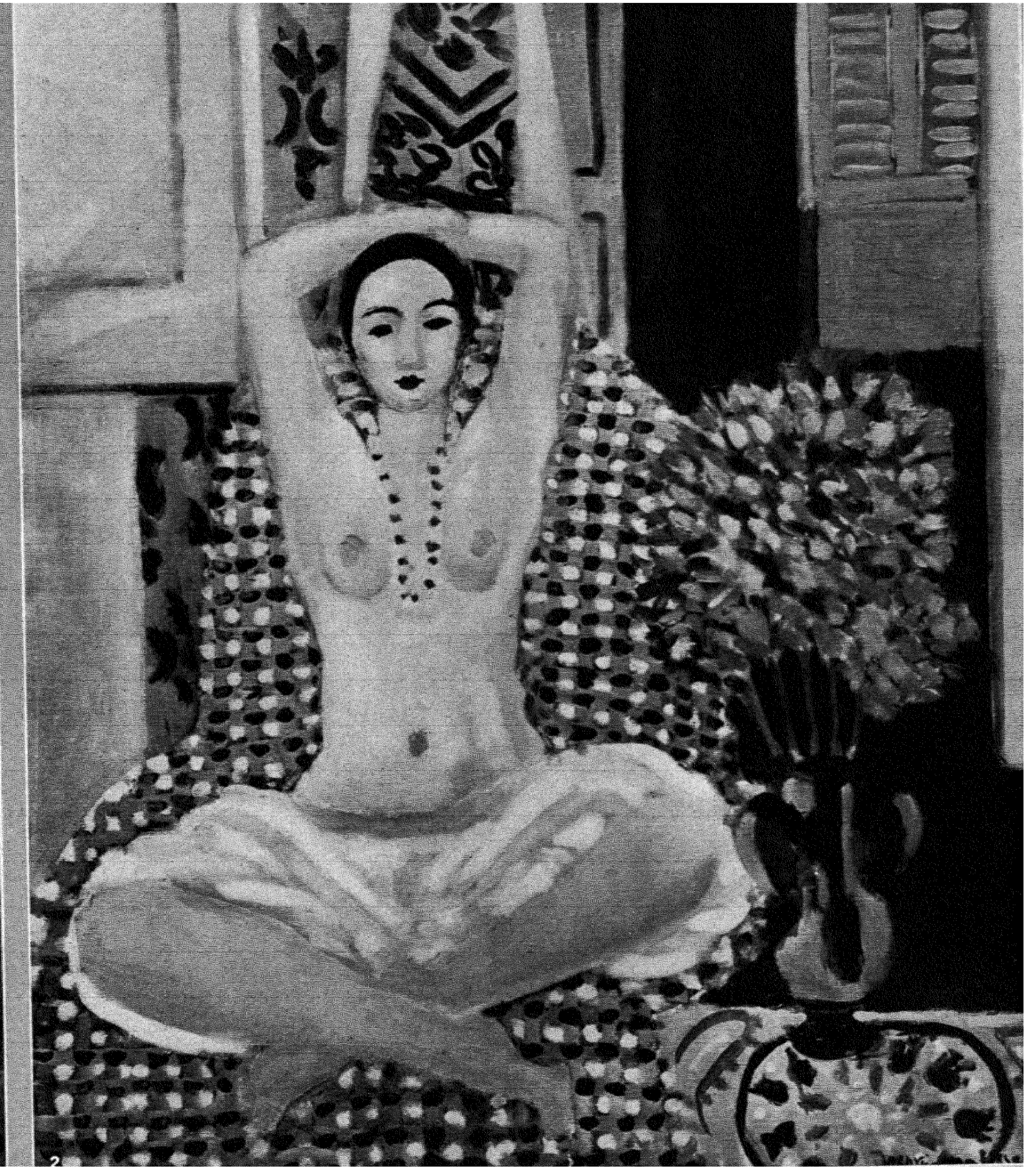
Watteau.—Watteau (1684–1721) was the incarnation of every grace and poetic spirit of the 18th century, during which French taste triumphed over the whole of Europe. Of him we may say that he stood alone, and had he not existed doubtless things would have taken a different turn, and the little masters Lancret, Pater, Bonaventure de Bar would have missed their line of destiny. Their work was not less charming than Watteau in the depiction of dances, *fêtes galantes* and gatherings in parks. Doubtless the same decorative taste, the same light paintings with gallant nudities and amiable mythologies, though not at all in the spirit of Watteau but harmonizing with architectural transformations, would have developed without him. The immense galleries and solemn apartments so loved by the early kings were replaced by elegant drawing-rooms and boudoirs, but on the other hand, if Watteau had not existed a unique enchantment would have been lost. He had inherited some of the Flemish traits which predisposes him to understand Rubens better than anyone else and in fact the first idea of his *Fêtes Galantes* might have been found in the paintings of Rubens, two variations of the *Garden of Love*, for when he was employed in Audran's studio at the Luxembourg he studied Rubens' *Life of Marie de Medicis,* and later at Crozat's he copied drawings of this master and compared them with those of the illustrious Venetians. *Jupiter and Antiope* shows the amalgamation of the Antwerp and Venetian influences together with a strong originality. Watteau also studied under Gillot the painter of masquerades, but none of these facts account for the harmonious softness and mystery which was his own. His drawing was replete with poetry and an exquisite atmosphere of pathos in which his landscapes are plunged—great trees in parks or glades, marble basins and statues which veil the glances of lovers; that aristocratic grace of the *Indifferents* and *Finettes,* of these young women and men arrayed in satins and laces whom he invests intentionally with something of his own spirit, for he was a slender invalid doomed to an early death, absorbed, incapable of looking after his own affairs, ironical and tender in turn, with the innocence and ingenuity of a child. After all, this idea of enchantment, comedy, comedians and actresses, fantastic disguises and furtive serenades, the beauties courted by gallants full of emotion and uncertain of their fortunes, the aimless walks and departures for unknown isles, was just as true as is our daily life. All this suffices to make him famous, but two or three years prior to his death this young genius who had no time to lose became bolder. The *Embarkation for Cythera* is a termination, not a beginning. It is like the climax of a romantic fairy tale, but Watteau was not content to remain the painter of the *Fêtes Galantes.* He felt he could make poetry of the subjects of everyday life and painted the *Gilles,* another theatrical character, but the spirit had altered. Then followed the *Gersaint's Shop-sign,* a picture of people in the dress of the time looking at pictures in a shop, which may go under the heading of genre. Watteau continued to aim high and then realized an unprecedented masterpiece, the sequel of which was to follow much later, and the dream of which in the 19th century was developed by Courbet, Degas and Manet. Thus realism, inherited from the old French artists, was reconciled to style.

Boucher.—François Boucher (1703–1770), cannot be ranked with Watteau, for whereas Watteau was essentially a poet, Boucher was an artist whose ambitions are obvious and absolutely in proportion to his faculties. He wanted to please his contemporaries, to ornament walls and ceilings for them, and in his best moments he succeeded perfectly in what he set out to do, creating a success so striking that he was barely able to execute all his commissions, and he wore himself out before his old age. As Le Brun had served Louis XIV. so he served Louis XV. He had a genius for decoration and a gift for composition, easy, elegant and always perfectly balanced, and his versatility included the accomplishment of an immense production, as well as the illustrating of a book, of a fan, in either of which he could compose amiable mythologies or people the sky and waves with roses and fair nudities. His masterpiece in this manner is probably the *Triumph of Galatea* in the Stockholm Museum, but he also painted excellent portraits as the *Young Lady with the Muff*, in the Louvre, and treated with brilliance and precision intimate scenes like *Le Déjeuner*, in the Louvre and *Modiste,* in Stockholm, of which a replica is to be found in the Wallace Collection in London With the exception of his later years when his work shows fatigue, his brush was sure and his colouring, though not refined, was rich, light and brilliant. What was missing to make of him a great painter? He loved his art and he worked hard. As a decorator he has gifts not inferior to those of his fascinating contemporary, Tiepolo. His cartoons for tapestry were admirable and, worked by the virtuosos in wool, his finest pieces have a fairy-like beauty. Though he was preceded in his path by a man of talent, François Lemoyne, he was an inventor. He had two illustrious pupils who owed much to him, Fragonard and David and through them his influence, more or less deviating, reached the 19th century. What therefore was missing that he could not be really great? Perhaps

A FESTIVAL PROCESSION IN VALENCIA, BY SOROLLA

A mural painting by Joaquin Sorolla y Bastida (1863–1923), distinguished as a painter of brilliant sunlight effects. He depicts here a festival in Valencia, his native province, showing the native costumes, gay trappings of the horses and banners bearing the arms of Valencia, which give vividness and colour to its fête days. This is one of a series of mural decorations representing Spanish festivals and other scenes in the life of the people painted by Sorolla for the Hispanic Society of America





TWO LEADERS OF POST-IMPRESSIONISM

1. "Le Cheval blanc" by Paul Gauguin (1843–1903). In the Luxembourg Gallery, Paris
2. "L'odalisque au vase de fleurs," by Henri Matisse (1869–). In the collection of Paul Guillaume

it is that his work only expresses satisfied pleasures, and art which in the language of the hopes, dreams and passions of restless humanity requires more. His *Le Déjeuner* and *Modiste,* dated 1739 and 1746 respectively, were not isolated in that epoch, for they had been preceded by Carl van Loo's *Hunting Breakfast* shown in the Salon of 1737, and others. Thus, even amongst court painters a vein of realism derived from the Flemish was seen in France side by side with gallant mythologies and decorative pastorals.

In 1750 Oudry painted the *Farm,* a picture that had been commanded by the Dauphin which was shown in the Salon of 1751 under the significant title "Picture in the Flemish Style." In the generation which followed, Lépicié continued the same movement of realistic peasant portrayal in his *Farm Courtyard* in the Louvre. All these painters proclaim more or less the little Dutch masters who were at this time in favour amongst the French amateurs.

Chardin.—Chardin (1699–1779) did not wait for these examples to demonstrate his ability as a painter of small subjects. In 1728 he was received into the Academy with two big canvases which were still life—the *Skate* and the *Buffet.* The technical quality is the first thing in his work which strikes us. They are pieces in which all the richness and subtleties of oil painting are wonderfully handled, and already one senses that intimacy and the poetry of humble things which placed Chardin apart from the thousands of others who painted still life and genre. He is notably superior to his contemporary Jeaurat, who treated the same subjects agreeably but not without hardness, and with a tendency to an anecdotal conception. Chardin was a truly original artist and purely French. His perception was more like that of Louis le Nain a century earlier than that of the light, superficial, brilliant spirit which dominated the so-called realism of his times. Unlike his predecessors, he did not search for his models among the peasants but painted the Parisian middle classes, in the surroundings in which he was born and lived; but this difference, small as it was, did not prevent him from depicting the same modest virtues. One gets from him almost as much as from Le Nain's picture *Blessings.* But more than a century had passed, the customs were gentler, the middle classes far removed from the austere peasants of the Le Nains. Chardin's housewives are simply but well dressed, and the same cleanliness is to be seen in the houses they inhabit. The spirit of good-natured elegance is the charm of these pictures of domestic life, which are superior to the masterpieces of the little Dutch masters, Vermeer excepted. At an equal distance of time from Louis le Nain and Corot, Chardin attained, without rhetoric or philosophic pretensions, this charming quality. In more than one of his contemporaries, however, metaphysics, which was then invading literature and which is one of the greatest enemies of good painting, was making itself felt both in France and in England.

Greuze.—Greuze (1725–1805) corresponds to Hogarth. It was not that he had been subjected to the direct influence of the author of *Marriage à la Mode.* It was rather his misunderstanding of Chardin that roused him to outbid this painter in a choice of subjects and scenery which he felt to be more interesting and moving. The public agreed with him and the writers applauded this mixture that was something new in painting, and in literature. The *Village Marriage,* the *Father's Curse,* the *Son Punished,* these almost too ingenuous compositions in which every detail is like an actor playing a part, were borrowed, as one imagines, from some tearful play or melodrama of the period. In spite of the cleverness of execution there was a weakness and falsity of sentiment in them, and they lacked the passion to overcome the unquestionable risks of literary painting. It was the bitterness of Hogarth's satire that saved him, and nothing like this could be expected from the mediocre soul of Greuze, who was, the writer believes, the first example of a painter who gained success bordering on glory which has not been ratified by posterity. He had, however, qualities as a painter which doubtless might have been happily employed had he not strayed into a false conception of art. Apart from their artifice and sentimentality, his young girls' heads possess a certain charm, and he was a good portrait painter.

La Tour.—Maurice Quentin de la Tour (1704–1788) was more draughtsman than painter, and, for a man so disposed as has been seen with Nanteuil and will later be demonstrated with Degas, pastel is the best medium for releasing an artist from the encumbrance of oil painting. In drawing, La Tour was indifferent to his medium, and crayon or pastel were only a means of securing the personality of his model, for human faces and expressions were all that he cared about, and these he loved passionately, with a sort of impartial frenzy. This man who understood others so well described himself in an often-quoted phrase and one that deserves to be remembered: "They believe I catch only the features of their faces, but I dive into their depths without their knowledge and I get them absolutely." Sometimes in his big portraits, in trying to be too precise and perfect he was liable to impart an impression of overwork; but his head studies which he termed "preparations" really answered to the words by which he confesses his aim. Nanteuil might have been more serious and profound, but Nanteuil could never have grasped so well the combination of vivacity, nobility and sparkle of the 18th century. Perronneau was neither a faultless constructor of faces nor a passionate analyst of expressions, and was far inferior to La Tour, being often careless, but what charm he had at his best! Vivacity animated his portraits no less than those of La Tour, but it was expressed with a less sensitive touch. He was, however, a born colourist and he had not the same reasons as his illustrious forerunner and rival for showing a preference for pastel. He painted a number of excellent portraits in oil, but La Tour having made pastels the fashion, Perronneau and many others decided to follow it. Pastel with its delicacy and unalterable freshness seems to be an invention harmonizing with the spirit of this age, the light woodwork of the apartments, and the elegance of feminine fashions, and it was left to Perronneau alone to discover charming colour schemes in it.

It was in this century in which women dominated, that women painters conquered a position which had never before been assigned to them, dedicating their talents principally to portraiture. In Watteau's time the Venetian Rosalba Carriera, was brilliantly successful in Paris and contributed to making pastel fashionable, subsequently introducing her crayons and amiable mannerisms into all the European capitals. In Fragonard's time a Frenchwoman, Madame Vigée le Brun (1755–1842), reigned supreme in portraiture and shows us all the graces of this dying century in her pictures of kings and great ladies, and particularly in the canvases where she depicted herself with her daughter. She travelled as Rosalba had done and was triumphantly received all over Europe. This brilliant school of French portraiture received reinforcements from foreign lands. Sweden, which up till then had been more or less ignored in the history of art, formed contact with Paris, with the portraitists and miniaturists, Roslin, Holl and Lafrensen—who in France was known as Lavreince. The last two named had the honour of giving a decided impulse to an art which had already had a fashion in the preceding centuries, and which, renewed, filled with grace, refinement and life, became one of the most charming expressions of the taste of the 18th century.

Fragonard.—Among these amiable artists, Fragonard (1732–1806), delightful, impertinent, inconstant, nonchalant, impetuous, a painter to his fingertips, closes in a shower of fireworks the art of the 18th century which was opened by Watteau with fairy poems of love and sadness. This man had so much grace and knew so well how to delight us that he was allowed a daring gallantry on certain subjects that would have been insupportable in the work of another. At times he threw off a canvas with the abandon of an improviser in an hour; at others he painted with the most delicate precision some tiny picture full of charm and mystery. At Grasse he decorated a house with five large panels which showed him almost a rival of Goya, the Goya of the cartoons and tapestries. His drawings have an exquisite delicacy, transparency and grace. In landscape he was rivalled by his Roman comrade, Hubert Robert (1735–1808), who made of the art a decorative theme derived more or less from the antique ruins by the Italian Panini, with an added romantic charm and a luminous harmony which is a far off reflection of Claude.

The first signs of a change may be noted in these paintings; a

return to the painting of fact which became the keynote of the 19th century. Already Desportes' studies were remarkable for their respectful feeling for nature. Vernet (1714–1789), in his French *Ports,* and in the *Rotto Bridge,* and the *Castle of St. Angelo* (Louvre) shows what he might have done had he been able to withstand the influence of fashion. They form a link between Claude's *Campo Vaccino* (Louvre) and the studies by Corot done during his visits to Italy. Louis Moreau, known as Moreau the Elder (1731–1805), a relation of the Vernets, noted very simple motives with delicate touch and forecasts the coming of Rousseau; and lastly, the charming picture in the Carnavalet Museum, the *Demolition of the Centre Arches of Sevres Harbour* shows the brilliant decorator, Hubert Robert, to have been a landscape painter who portrayed nature without mental reservations. Only the stimulus that eventually came from England was necessary to develop the centre of art in France in the 19th century.

French taste had spread all over Europe in painting, architecture and furniture, and her artists were called by royalty to Spain, Russia, Sweden and Germany, while Germans, Dutchmen, Flemings, Swedes, Italians, Swiss, and Russians flocked to France to study.

OTHER COUNTRIES

Sweden.—The Swedes, Wyrsch, Liotard and Angelica Kauffman, Roselin, Holl and Lavreince studied in Paris, while Pilo (1711–1793), Elias Martin and Wertmuller remained more loyal to their native taste.

Russia.—Russia at this time showed both Italian and French influences; and the fashionable Viennese portrait painter, Lampi, was then popular. For centuries the Russians had constantly repeated the mysterious beauty of Byzantine Ikons. Dmitry Levitsky (1735–1822), was influenced by French tradition and his portraits, and more especially the paintings of the school girls of the Smolny Institute, are full of tender romantic charm. This school, like many others founded on French art, was chiefly that of portrait painters, though in Russia a certain realism naturally led in this direction. Borovikovsky (1758–1826) though somewhat reserved was an observant painter of state portraits, and even the genre painters like Venetzianov (1780–1847) were portraitists in their way. The best Russian painting of that epoch was due to them, until, from another source, the rays of French impressionism penetrated to Moscow and St. Petersburg. Elsewhere a group of artists somewhat after the manner of the reforming musicians known as the "Five" set out to create a more authentic Slavic art impregnated with Oriental picturesqueness.

Germany.—Germany was dominated for some time by a charming French painter now almost forgotten, Antoine Pesne (1683–1757), a portraitist and the decorator of the music room of the Palace of Sans Souci. Then a new ideal, inspired by the archaeologist Winckelmann, attracted artists to an arbitrary and pedantic Hellenism beside which the academicism—that of David—appeared full of suppleness and life. Winckelmann's influence is comparable with that of Viollet-le-Duc a century later. Both were scholars and initiators who truly helped the progress of art, one bringing back the spirit of the Greek and the other the principles of the Gothic, but the influence was the reverse of that intended, for in trying to deliver artists from the influence of the frivolous contemporary art they succeeded only in subjecting them to an infinitely more withering pedanticism.

The first and most regrettable victim of aestheticism *a priori* in art was Raphael Mengs (1728–1779), who had the gift of painting as is proven by his portraits, but lost all of it in the academic compositions which enhanced his reputation. Until the middle of the 19th century Germany bore the brunt of another mistake that was continued in a cold style by the Overbecks (1789–1869), the Corneliuses (1783–1867) and others known as the "Nazarenes" who, under the pretext of consecrating themselves to Christian and Germanic themes based on the Italian primitives, rather than on the Greeks, believed that they were reacting against Winckelmann's influence. However, the paradoxical result of this return to the antique was the emancipation of the national schools which until then had taken their cue from France. Actually France was just as overwhelmed by the infatuation for the Greek ideal, but the movement was more fruitful, thanks to David's strong personality, and in the other countries such artists as Mengs, Thorwaldsen in Denmark and Canova in Italy should have gone to the Greek originals for they did not require David's assistance. Strangely enough, by another paradox, when this artificial classicism tumbled of its own weight the schools that attempted to show their own national character only revived by again joining up with the French tradition as was the case, in Scandinavia, of Christian Krohg and Anders Zorn. Under Frederick II., about 1850, Adolphe Menzel who was a better draughtsman than painter departed from both the Winckelmann and Nazarene schools using true observations in even his pseudo-historic compositions as did Wilhelm Leibl, scrupulous painter of peasants, and Hans von Marees, a descendant of French Protestant refugees, in his poetic and decorative compositions not unlike Puvis de Chavannes and Gauguin; and finally impressionism influenced the art of the north countries through such artists as Liebermann.

FRENCH PAINTING—18TH AND 19TH CENTURIES

As indicated in the discourses at the Academy by the Count de Caylus on Watteau's life, it was apparent that reaction had started against the influence of the antique and of the frivolously graceful type of painting. It was in 1748, several years before the discoveries of Herculaneum and Pompeii which had enraptured the scholars in 1755, and even before Winckelmann's first publications, the *History of Art Amongst the Ancients,* wherein he recapitulated ten years of his work (although his *Reflections on the Imitation of the Greeks in Painting and Sculpture* was already known in France), that Madame de Pompadour copied antique cameos under the direction of the engraver, Day, and encouraged the great change in architectural and interior styles. Thus came about the great period of "Louis XVI." actually started in the middle of the reign of Louis XV. whilst that called "Empire" was practically formed under Louis XVI. Vien (1716–1809) found inspiration from Pompeian painting. His rather feeble archaeology he transmitted to many pupils.

David.—David (1748–1825) worked in Vien's studio but owed little to him; Vien's authentic pupils, Vincent and Regnault, are nearer to Prud'hon than to David. The future author of the *Horatii* and the *Leonida at Thermopylae* was a pupil of Boucher before going to Vien, and until his departure for Italy when after persistent trials he obtained the "prix de Rome," his paintings were fairly docile imitations of Boucher, showing a slightly greater taste for the antique subjects. At Rome he suddenly adopted Winckelmann's doctrines with all the uncompromising enthusiasm of his nature amplified by the French writer, Quatremere de Quincy, whose pen was no less authoritative than David's brush in his *Considerations on the Arts and Drawing in France,* written in 1791. These two set the standard of the new aesthetism, the truly beautiful of the Greek masterpieces, and accepted the reasonable form in them dependent of course chiefly upon sculpture, as Greek painting had disappeared, and consequently proclaiming the superiority of drawing over colour. These influences are shown in the *Oath of the Horatii* (1785) which proclaimed David's name to the skies and indicated the promise of a revival in art of what was then called republican virtues through an heroic ideal; and David became the author of the most radical rupture in French aesthetic tradition, aided by the support of that terrible political revolution, in which he played an important part. David, a true artist, was strong in passions, and more dictator than theorist, and though Frenchmen love a game of ideas in which they often excel, they are too fond of life and realism to be dominated long by the abstract.

David harmed others more than himself, for being weaker than he, many who showed in their sketches the qualities that animate true painters, stripped themselves in their large canvases to obey the rigid aestheticism of the master. David was saved by the love of truth which inspired him to excellent portraiture, and many of these portraits have nothing to do with the antique ideal, such as *M. and Mme. Pécoul* and others, extending until the last years during his exile in Brussels when he did *Mme. Morel de Tanguy and Her Daughters.* Perhaps nothing is more realistic than the

An example of the work of Hilaire Degas (1834–1917), a French painter of the Impressionist school, best known for his many paintings and drawings of ballet dancers. In the Louvre

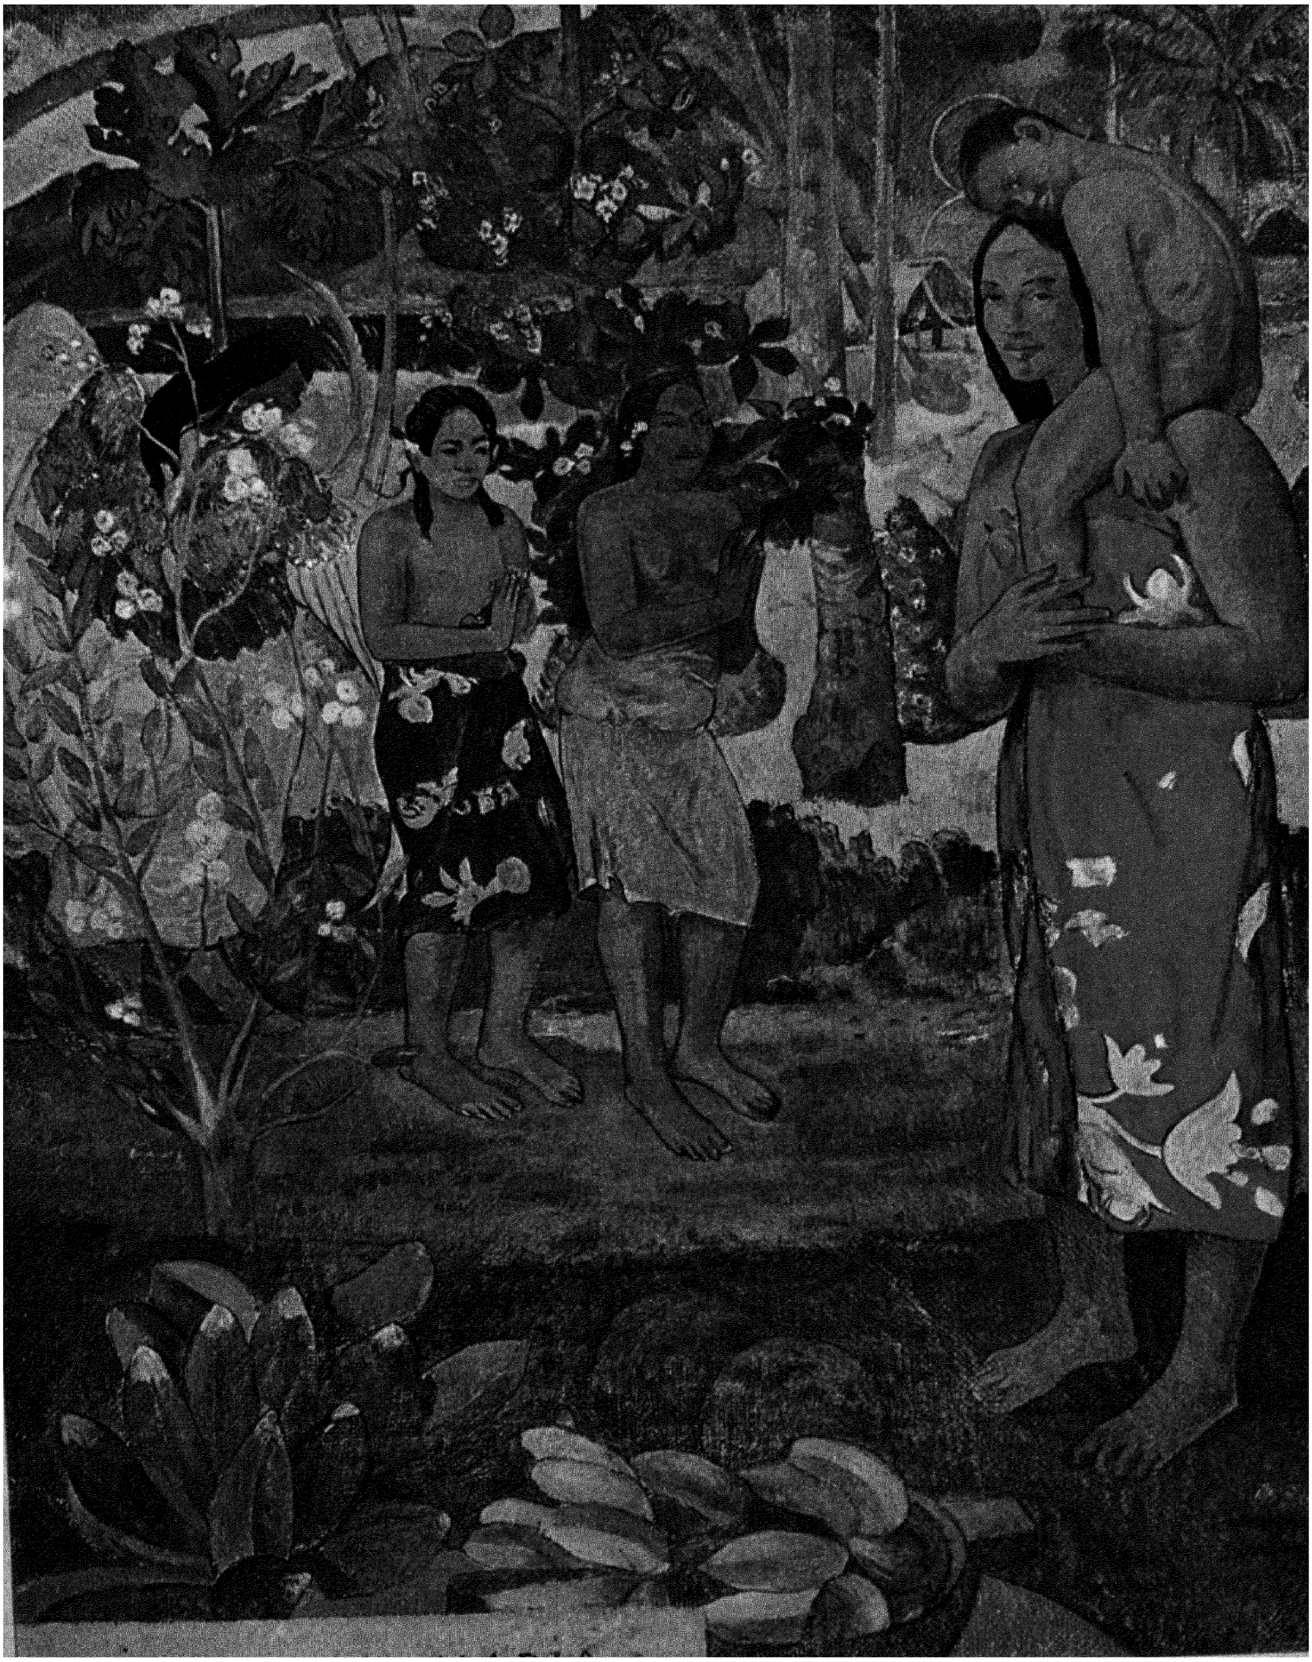
We must not forget that in Protestant England preaching was not as in the Latin countries reserved to the priests and confined to the churches. England is a country where everyone at any hour or place appears to have the right or duty to moralize and reprimand his fellow creatures. That spirit which oscillates from utilitarian moralism to poetic fantasy embodying all that is most individual to the English school produced Hogarth and Blake, two geniuses of incontestable originality and of equal strength and rarity. Hogarth's case is curious. The famous series of paintings the *Harlot's Progress*, 1732, the *Rake's Progress*, 1735, and the *Marriage à la Mode,* 1745 are examples of moralizing which seem to us absolutely out of bounds in the dominion of art, particularly of art as it is understood by the moderns, though perhaps some such examples could be recalled in the middle ages—more particularly in literature than in painting; but even the popular productions of the middle ages show a higher spirituality. In Hogarth the moral preoccupation was infinitely more important than art or beauty and he took the trouble to tell us so himself. He painted "comedy" and considered it a work of "public utility." His moralising was composed of good, coarse, practical truths untouched by any trace of the heroic. This devil of a man put into it all such a verve and powerful vitality! He defines and puts into motion before us such a gallery of violent types and characters that they dazzle our eyes; all criticism is silenced and the reserves of the sensitive are overpowered. A comparison between the grand and noble Nicolas Poussin, philosopher and poet, and this pamphleteer whom no triviality, no coarseness frightened, seems a challenge to good sense, but Hogarth was, the writer believes, the only painter who possessed to the same degree as Poussin the faculty of inventing human drama wherein each actor had the gesture and expression his part demanded. He did not compose from the Doric, Ionic or Lydian styles, or from any of those that the author of the *Ballo della vita umana* believed to be borrowed from the Greek. His was the cynical style, but the difference of eminence in taste does not diminish his rare merit as a painter of human comedy. He had, like Poussin himself, an impersonal craft with just the necessary colour and matter to interpret his ideas. Many details of still life, drapery, or landscape, show that Poussin, if he had cared, could have produced in his pictures all the harmonies, riches and brilliance attributed to great painters, but his conception was opposed to materialistic charm. Hogarth by instinct, no doubt, obeyed the same law of reason. He had all that was best in a painter or colourist as can be seen in the few portraits he left to us, and in the celebrated study known as the *Shrimp Girl,* but in his satirical and moral pictures he was content to use the more sober and most simple means without colour effects or obvious virtuosity, thus obtaining his objective all the more surely.

Reynolds.—This dictator, this disdainer of all culture, this Englishman who would be naught but English, had an influence on the most cultivated, refined, intelligent, learned and cosmopolitan of the great painters: Sir Joshua Reynolds (1723–1792). It is impossible to imagine a greater contrast between two men and their works, yet it might be said that Reynolds was in a way the legitimate heir and successor of Hogarth. All that was required to place this original school upon an equal footing with its rivals was science and elegance of taste, and Reynolds was the predestined man to give the most perfect expression to the highest aspirations of his country in a manner up to this time impossible. He achieved his aim by introducing into English art the treasures of experience accumulated during centuries by other schools. He was influenced more by Hogarth than by his estimable official master, Thomas Hudson (1701–1779), but his debt to the great masters of the past was even more considerable—to Titian, Rembrandt, even Raphael, Michelangelo and the Bolognese, not to mention Rubens and Van Dyck, who to an Englishman of those times hardly seemed like foreigners. He studied them not as a dilettante but as an aesthetic practitioner, and assimilated all that their genius and technique could give, to endow his country with an art worthy of its other traditions. In his writings he has set up the doctrine of imitation for which he has sometimes been reproached, but unjustly, since he knew how to assimilate to his own personality what he borrowed and make of it a composite creation of homogeneous personal and national character. In England the different nations melt into a sort of unified entity that she designates as "the Continent"; for this reason imitation is less dangerous to her, particularly when practised by a Reynolds, gifted with much intelligence and good taste. The only danger in imitation for an artist lies in being entirely under the sway of one master, but on account of their diversity and distance Europe's influences when they reach England have already undergone a metamorphosis.

At the age of ten Joshua was already reading works on the theory of painting. After his studies in London several years of travelling gave him an even more profitable culture. On his return to his country at the age of twenty-nine his memory, imagination and hand were ready to serve him in any enterprise of his art; and because the Englishman of those times could think of no other use for his talent he became a portraitist. He tried historical painting, adding a little to his fame, but he invented an original conception of portraiture arranged as for a picture so that thus understood the portrait required no less imagination than historical painting. In those fine pictures of great ladies with wonderfully dressed hair and beautiful gowns, important men, soldiers or scholars, delightful children, fair and rosy, there are horses and dogs as elegant as their owners, smiling or stormy skies, great overhanging trees, princely parks, terraces, columns, draperies of silk and velvet, ribbons and laces; everywhere an ingenuous composition ceaselessly renewed; everywhere a rich and subtle craft which only errs through excess of complication. The supreme aristocracy of his art lay in spreading over all the luxury and elegance an air of familiarity, amiable abandon and romance; and one day this virtuoso seemed to forget all his calculations and depicted his dream of womanhood in his most perfect painting, the portrait of *Nelly O'Brien* (Wallace Collection).

Gainsborough.—Thomas Gainsborough (1727–1788) was four years younger than Reynolds and his rival in fame. With nothing about him of the theorist, doctor or schoolmaster, he remained uninfluenced by the masters of the foreign school. He never left England and after a few years' apprenticeship in London passed the greater part of his youth at Sudbury where at the age of nineteen he married a seventeen-year-old Scotch girl, a natural daughter, it is said, of the Duke of Bedford. Later he went to Ipswich and Bath and lastly returned fo London. At Bath which was then the haunt of fashion and the most elegant society he had ample opportunity for the exercise of his art as a portrait painter and his success was so great that he was without loss of time admitted to the Royal Academy which finally brought him to London in 1774. He had, however, a French master at the age of fourteen, Gravelot, who had a studio in London. His drawing was not impeccable; his compositions were not as scholarly and balanced as those of Reynolds. Often his figures seemed to be carelessly posed on the canvas. But he had charm. He was instinctively a poet of ceaselessly vibrating sensibility, capricious and fantastic but always natural. Though he did a few good portraits of men he was above all the painter of women and children. He had a profound admiration for Van Dyck and took him as his model, but this robbed him of none of his originality. Doubtless he thought of Van Dyck whilst painting his *Blue Boy*, but this celebrated painting enchants us by its poetic mystery and musical quality to which the prodigious author of the *Charles I.* portrait was an entire stranger. The *Blue Boy* might be a young brother to Watteau's *L'Indifférent* rather than of the supremely elegant but absolutely realistic young *Princes* of Van Dyck. It is unfortunate that this picture has not a name taken from one of Shakespeare's comedies for the *Blue Boy* deserves it hardly less than that pearl of feminine pictures by the same painter, the portrait of the lovely actress who was the Prince of Wales' mistress, *Perdita,* which masterpiece of Gainsborough is in the Wallace Collection.

During the years of his youth at Sudbury and Ipswich Gainsborough acquired his love for the beautiful country so that almost without thinking about it he became the true creator of the great English school of landscape painting.



"I GREET YOU, MARIA," BY GAUGUIN

A Tahiti study by the French painter, Paul Gauguin (1848–1903), one of the pioneers of the Post-Impressionist movement. The last years of his life were spent in Tahiti, and to this period belongs his most mature and characteristic work. In the Adolph Lewisohn Collection

Richard Wilson (1713–1782) was fourteen years older than Gainsborough and started landscape painting late having first concentrated on portraiture. He visited Rome where he remained for six years and was encouraged by Zuccarelli and Joseph Vernet, and there painted his first landscapes. Returning to England he continued his career in the classical style, sometimes varying his reminiscences of Italy in favour of the beauty of the country of Wales where he was born, but always remaining faithful to the formula derived from the Italianized Dutchmen, particularly Claude.

In spite of monotony one must admit that Wilson's canvases reveal a charm of noble serenity, especially those in which light from his immense limpid skies is reflected in the waters of a lake framed by harmonious lines of mountains. Gainsborough also began by imitating the Dutch when he painted Harwich Road or the country around Sudbury, but it was his style which English landscape art followed, more especially in those canvases painted between the ages of twenty and twenty-five which already suggest Constable's early works He put into his pictures *The Watering Place* and *Returning from Market* an accent of nature which was then unknown.

After Gainsborough and Wilson there were a number of landscape painters in England. Nasmyth (1758–1840) and Thomas Barker (1765–1847) deserve notice, particularly the latter because of his robust unforced colour. John Crome, known as Old Crome (1768–1821) was entirely different. Except in 1815 while in Paris where he painted a fine picture, the *Boulevard des Italiens,* he resided in Norfolk and established there a tradition which became the keynote of the 19th century. He conceived nature from the viewpoint of a portrait painter, renouncing conventional arrangements and distinguishing between resemblance and expression, between the objective and the subjective, which during the 19th century continued to grow, allowing the most original variations from Constable and Turner to the French impressionists. Crome, uneducated and the son of a workman, learned his craft without a master by studying the works of the Dutch whose influence can be felt in his first pictures. He divided the elements of landscape into three divisions: (1) the sky with its infinite gradations; (2) the ground structure; (3) the trees. Only Théodore Rousseau loved great oaks as Crome did. Of Crome's pupils, Cotman, Stark and Vincent, the first was the most gifted, and it was he, with Thomas Girtin and Cozens, who revived the watercolour, a form of painting which later became an institution.

At the same time three men of very different calibre showed themselves as much more original; two geniuses, Constable (1776–1837) and Turner, and a charming painter, a delightful colourist who had he lived long enough would doubtless have become great —Bonnington. John Constable, the first to be influenced by the Dutch, owed much to Rubens' landscapes, so full of passion and vigour, but his real model was Gainsborough. It was not that his choice of subjects was so original, for his *Watering Places, Fords,* and *Hay Waggons* show the same motive as those of Gainsborough, but he inaugurated a new era both in technique and sentiment. With the exception of François Desportes, who at least a hundred years earlier painted a number of little fragmentary studies which have only come to notice lately, Constable was the first to consider that the essential duty of a landscape painter was to study directly from nature. On a certain day, at a certain hour the artist stops before a natural spectacle which impresses him either on account of its serene beauty, or because of its dramatic aspect, or some other shade of expression, and the picture that he could make and feels that he wants to make appears before his imagination. So as to lose nothing, nor allow the emotion he feels to cool, he tries to fix with a few rapid sweeps of the brush, lines and colour representing masses, and light, and it is this momentary expression, the most individual and least reproductive, which, contained in his study, becomes the soul of his future picture, and in the more or less slow work on the big canvas it is his goal to enrich and complete rather than transform or construct. In his work he attempts to keep the first freshness. It was to these two preoccupations, what might be called the research in the field, and its development and construction in the studio, that Constable gave himself up, with a kind of lucid intoxication developing the palette of an original colourist and a vibrating technique proclaiming from afar the advent of the French impressionists. He audaciously introduced an almost acid green into painting which had known until then blue, yellow and more often brown spectacles. Sometimes in his passion not to neglect detail he compromised the unity of his picture, but he always dazzles and refreshes us, and those inestimable treasures, his sketches, are so fresh and vivid that they seem to have been painted only yesterday.

From 1820 criticism started to relax and in 1824 Constable exhibited several important canvases at the Paris Salon where they triumphed. Constable's paintings were a revelation to Eugène Delacroix, the proof of which can be seen in his *Journal* and *Correspondence.* It is said that after seeing the canvases of this illustrious English painter the day before the Salon opened he hurriedly repainted the background of his large picture the *Massacre of Scio.* So strong was Constable's influence that all painters of the 19th century were affected by it excepting only Corot. (*See* COLOUR PLATE—LANDSCAPE PAINTING.)

Bonington.—Bonington (1801–1828) formed a more marked connecting link between England and France. From the age of fifteen he studied at Calais with Louis Francia, a good teacher and clever water-colour technician. Then he entered Gros' studio in Paris and at the age of nineteen was admired by Delacroix who was then working on his *Dante's Barque.* Thirty years later in a letter to Th. Silvestre, Delacroix still talked of that charming young man who was so marvelously gifted. During fully the last seven years of his life Bonington travelled in France and Italy executing water-colours which are little masterpieces of brilliance and limpidity, and oil paintings no less seductive. He painted *Francis I. and the Duchess d'Estampes* and *Anne of Austria and Mazarin,* investing them with a grace and conception of colour that were entirely his own, and lastly in a few landscapes, such as the *Lake at Versailles* and the *View on the Normandy Coast* (Louvre), he showed a broadness of vision and a sureness of touch that indicate the great painter he might have become had he not died, leaving fame to both the English school and the French, at the age of twenty-six.

Turner.—Turner (1775–1851) was equally precocious. At the age of fifteen he had already exhibited a *View of Lambeth* and soon after made a reputation as an amazingly clever water-colourist. A disciple of Cozens and Girtin, he showed in the choice and presentation of his compositions a picturesque imagination which seemed to indicate a brilliant career as an illustrator, for it was the fashion in England at that time for artists to do illustrated albums showing stages of a voyage or celebrated views, and all his life Turner was a prolific illustrator of voyages. His most famous collection was the *Rivers of France* (1833–1835), but he travelled in Germany, Switzerland and Italy and after studying profoundly all of Claude's canvases that he could find in England he copied and imitated them in a marvelously perfect way, and out of admiration for this master he asked that his *Sun Rising through Vapour* (1807) and his *Dido Building Carthage* (1815) be placed beside one of Claude's masterpieces in the National Gallery, where they are still to be seen. There was a secret affinity between Claude and Turner: the light, the immense sky spreading over mirroring waters, the frame of noble architecture and fine trees amongst marbles—a scene for a mysterious opera whose songs have never been heard. All that was in Claude is reflected and multiplied in Turner. He was composed of contrasts, difficult of humour, though capable of generosity, avaricious, and yet showing the most fastidious, magnificent disdain of everything, even his fame, though he did recognize with most meticulous precision the programme of posthumous honours due to him. Thus he was filled with irreconcilable aspects but was always imperturbably himself. At the height of his glory and fortune this great artist died in an extraordinary manner under a false name in a garret where after having donned shabby clothes he went to find a woman who was neither young nor beautiful to whom he gave just enough to prevent her dying of hunger, and who thought him a member of the provincial middle class. One could dream for-

ever over such an unprecedented adventure as one might dream before the picture *Ulysses Deriding Polyphemus* or the *Palace of Caligula*. He never told his secret, and doubtless organized this double life in a madness for solitude, a longing for liberty, a wish to escape the narrow conditions under which he had to live surrounded by honours, luxury, flattery and applause, which though first intoxicating always welds chains of servitude in the end. He clung, however, to his golden chains as much as to his miserable incognito, plunging into the troubled depths of the ocean and then, when he wished, rising to the surface radiant and majestic. Who has not dreamt under one form or another of escaping himself, and is this not the explanation of the desire for travel which seems to us so natural and normal in the artist?

It was only in 1819 that Turner visited Italy for the first time and then again in 1829 and 1840, and it was the beauties of the country that helped him in his art more than the influence of any painter or school of painters. He could not have dreamed the light of his skies before the iridescence of a sea-shell, and it was undoubtedly in Italy that he acquired much of the colour which could never have been imagined in England. Humanity really only inspired him when united to an idea of death, but a singular death and a lyrical swoon like the close of an opera. Compare his *Polyphemus* to that of Poussin. Turner's picture fascinates us, but we think of nothing precise or human—all is phantomlike in unforgettable colour. What a theme for Turner was the *Funeral at Sea of Sir David Wilkie,* one of his most striking compositions: those two vessels alongside each other in the misty radiance of the setting sun, and the coffin disappearing into the depths of the waters!

England had at that time other visionaries, in turn or together puritanical and romanticist. Milton, Shakespeare and the Bible were their principal sources of inspiration, but none of them had gifts comparable with Turner's. The Swiss, Henry Fussli, known in London as Fuseli (1741–1825), writer and painter, belonged to this school with its fantastic style. One of his pictures is called *Nightmare* but nearly all, even those supposed to illustrate some delightful scene of *Midsummer Night's Dream,* might have the same title. John Martin (1789–1854) illustrated *Paradise Lost,* though his talent is more evident in his mezzotints. His painting displayed an imagination in composition far superior to the academic dementia of Fuseli. His most celebrated picture is the *Feast of Belshazzar*.

Blake.—William Blake (1757–1827), poet, draughtsman, engraver and painter, was animated by similar pre-occupations. His art was formed of the same elements—Gothic art, German dreaminess, the Bible, Milton, Shakespeare, Dante, and a certain taste for linear drawing which through Flaxman brought to him the great classical movement begun by Winckelmann and continued by David. This is the only point of contact between Davidian classicism and English art, and how indirect, how different the spirit! Blake was the only mystic of the English painters, perhaps the only real mystic among painters of those times. He was ingeniously so and transcribed in his personal imaginations or in his interpretations of the poets a pure and candid soul, like the title he gave to his first work of poems which were composed, illustrated, and put to music by himself: *Songs of Innocence*. But he attained grandeur and strength, and above all depth in certain paintings, such as his *Spiritual Form of Pitt Guiding Behemoth* For a long time he was misunderstood and his works considered the incoherent ravings of a madman, though today he is accepted as one of England's most illustrious and original artists.

Besides such individuals as Turner and Blake the second generation of portraitists came into being: Romney (1734–1802), Hoppner (1759–1810), and Raeburn (1756–1823) who were excellent painters, and only the unique genius of Reynolds and Gainsborough obliges us to place them in second rank. Romney has left us innumerable pictures of the celebrated Lady Hamilton and he displayed a distinguished talent in his family group. The pictures of young men and girls painted by Hoppner are full of charm. And Raeburn had a rich warm palette and his touch was broad and accented. He arranged his sitters with decision and really had the talent of a great painter. But we must also mention Beechey, a clever practitioner but more ordinary, and there were many others in England, at this happy time, who did good portraits: Benjamin West, who succeeded Reynolds as president of the Royal Academy; Gilbert Stuart, Opie and John Russell, who was the pastellist of the school. To Russell's amiable but somewhat insipid art add the worldly elegance of the miniaturist Richard Cosway (1742–1823) and his disciples Engleheart and the Plimers. (*See* MINIATURE PAINTING.) Downman (1750–1824) hovered between the pastel and miniature painting, between which there seems to be a certain affinity, for in France there was also a return to the miniature at the time of the great pastel fashion.

Lawrence.—Lawrence (1769–1830) carried his triumphant brush into all the courts of Europe and thus the first century of the English art of portraiture terminated with a great name. This painter of kings, princes, diplomats, warriors and even the Pope presents his sitters with a sovereign reserve and elegance. The *Holy Alliance* is among the thirty-four canvases of Windsor Castle in the collection of official portraits. Lawrence surpassed Reynolds in success and in precocity, though he did not possess the thoughtful science and rich, fine imagination of his predecessor. At the age of ten he was a portrait painter and at twenty-two he had painted the ravishing picture of Miss Farren, later Countess of Derby, and he quickly became a member of the Academy and a favourite of the king. He has as much coquetry in painting as many of the beauties whom he painted and these two coquetries made a pact for our pleasure. There is superficiality in it all, and artifice, but an artifice manoeuvred with such allurement and life that it becomes naturally beautiful. This clever fastidious courtier was refined and intelligent. He collected a remarkable group of drawings. In 1825 Eugène Delacroix, aged twenty-seven, was received by Lawrence in London. He was charmed by the man and admired his talent, for though Lawrence was a snob in his painting, it was his way of being himself and English, and in spite of these qualities we have a striking evidence of the impression he made on the young artist from France, for in the portrait Delacroix made of his friend, Baron Schwiter (National Gallery), this famous Englishman's influence is visible in the colour, the arrangement on the canvas, the model's pose, and even the will to attain elegance accented by elongating the proportions, though in the facial expression and the drawing of forms Delacroix was himself with all his complexity and inward excitement—those spiritual things to which Lawrence paid no attention. In England there were only feeble imitations of Lawrence, and later in the time of the pre-Raphaelites he was accused of empty virtuosity, but when Delacroix went to London, seeking to reconstruct traditions of France which had been compromised by the systematic dryness of the Davidian school, Lawrence showed him that in a return to harmony, richness of colour and grace of touch not unlike that of the old masters, an entirely modern art could be created. Thus Lawrence stimulated French energies with as much efficacy as Constable, and later had an influence on Carolus Duran and Sargent.

After this period in which English painting led the world there was a decline, partially due to a most praiseworthy effort the result of which proved it to be in vain. It might be said that the pre-Raphaelites were a prolongation and transformation of the idealistic movement oscillating from the fantastic to the mystic, from which came at the beginning of the century Fuseli and Blake. Thomas Stothard (1755–1834), with his pictures inspired by Shakespeare or Chaucer, in a way continued this movement. A little later Ford Madox Brown (1821–1893) painted his first Gothic pictures with dry precision and scrupulous attention to detail. In 1848 the new school or brotherhood found its name, for, under the influence of John Ruskin, who was a fanatic and in a way a poet, impregnated with puritanism and aesthetic spirit, the group took on an almost religious character and each adherent had to follow his signature with the initials P.R.B. (Pre-Raphaelite Brotherhood). They wanted to react against the facility and frivolity of the art sprung from Lawrence, but they precipitated decadence and a result far removed from the academicism for which Raphael himself was responsible, and an artifice, more literary than plastic, made itself felt everywhere in their works. CÈZANNE AND MONET

Left: "L'Estaque" by Paul Cézanne (1849–1906). Cézanne was trained under Pissarro in the principles of Impressionism. He later departed from the Impressionist technique, however, placing his emphasis on form and colour in a manner which has exerted a strong influence upon painting in the 20th century

Right: "Fruits" by Claude Monet (1840–1926), French, leader of the Impressionist school. The Impressionist technique is well illustrated here in the use of colour to indicate the effect of various lights upon the white surface of the table-cloth

haps this was because in the origin of their school was strongly felt the influence of two literary men, Ruskin and Dante Gabriel Rossetti, who was a poet and even a journalist before being a painter. Strange association uniting an enthusiastic *doctrinaire* as narrow as Cromwell's Roundheads and the son of a revolutionary refugee in London, ambitious, unquiet, voluptuous, subtle and uncertain! The miracle lies in the fact that from these two contrary elements sprang an art of truly English character. The P.R B. group contained a serious Christian, Holman Hunt (1827–1910), who was a painter after Ruskin's heart, but his works were cold in style and crude in colour. John Millais (1829–1896) was superior to Hunt and Rossetti as a craftsman, but finally changed, almost surpassing his pre-Raphaelite precision in the painting of sentimental anecdote laboriously made into the form of a large canvas, and ended by doing portraits. All that poetry which was too literary but at times sincere in emotion, was to be found in Rossetti and Burne-Jones (1833–1898), and these two created a new type of feminine appeal, more trouble in the former, purer and more chivalrous in the latter, a type of girl in which there was more mannerism than plastic force but whose enigmatic charm is undeniable; true quintessence of English sentimentality, which, one knows not how, persuades us that the race of Virgins or Botticelli Venuses had their natural descendants on the borders of the Thames, and to have created a type of woman is something in an artist or school that posterity can never forget.

Pre-Raphaelitism bore fruit beyond the domain of painting into decorative arts, thanks to William Morris and Walter Crane. George Frederick Watts (1818–1904), with the resources of modern painting, tried to express his rather lofty and confused ideal and introduced the symbolism that developed in France and elsewhere during the last years of the 19th century. His portraits are his best works Leighton (1830–1896) and Alma Tadema (1836–1912) retained something of the scrupulous precision of this school, but with them it became pure academic virtuosity and only served in inserting an elegant insipidity into conventional archaeology Whilst Burne-Jones was continuing his rather morbid but distinguished dreams, whispers from outside changed the English atmosphere little by little. They came first from France as realism and then impressionism They came also from America where was discovered, re-discovered, indeed, those brilliant truths in painting that an idealistic interlude had made England forget for a time

AMERICAN SCHOOL

The first American-born painters worthy of mention belong to the latter half of the 18th century. Gilbert Stuart (1754–1828), who painted Washington and most of the heroes of the War of Independence, Benjamin West (1738–1820) and Copley (1737–1815), though they extended their careers in London where they obtained success and honours, but none of these were distinguishable from the moderate English painters of those times, and only after 1870 the founding and rapid enriching of large museums and great private collections created an atmosphere more favourable to artistic vocations. At the moment the prestige of the Barbizon school, especially Millet and Rousseau, was immense, and American artists preferred to travel in France than in England However, the greatest American name combined the influences of both countries with work that was incontestably original.

Whistler.—James McNeil Whistler (1834–1903) had the gift of seizing with a subtle intuition the vital current of ideas that periodically agitate the world of art. Living in Paris and then in London directly after the Universal Exhibitions of 1855–1857, in which the arts of China and Japan were shown, he began to divine sources of renewal and original inspiration they offered European artists (*see* ART—*Far Eastern Methods;* CHINESE PAINTING; JAPANESE PAINTING AND PRINTS; CHINA, AESTHETIC DEVELOPMENT; POTTERY, NEAR AND FAR EAST) Whistler's father was an engineer in the Russian service, and at the age of twenty-one his son, after having led a nomadic childhood, arrived in Paris and almost immediately his independence and irregularity caused him to sympathize with the young artists of the day, Monet and Fantin Latour. Of the preceding generation he admired Courbet and Troyon. His bitter sarcasm made him many enemies, especially in London, and among them Ruskin put up a violent opposition to the painter who ridiculed the pre-Raphaelite commandments. Whistler was also witty with his pen—his *Gentle Art of Making Enemies* is a record of bitter polemics. In France, on the contrary, the friends of this youth remained faithful to him and it was from there that we have canvases that are celebrated today, as the portraits of his *Mother,* that of *Carlyle and Miss Alexander* which obtained the first favourable notices from the critics. The portrait of his mother was acquired by France and kept in the Luxembourg until it went to the Louvre. After 1890 he was much preoccupied with landscape. He had long been a master of etching; and the training he had undergone enabled him to use to the best advantage all that was individual in his perception of landscapes, interiors and the nude. His painted landscapes also serve to express that element of his soul, so aristocratic, so disdainful of noise, agitation, and almost of life itself. He required the calm and mystery of night as expressed in his nocturnes, harmonies in blue and gold, etc Despite his relations with Degas and others, he escaped the influence of impressionism, though he created a sort of impressionism of his own, mysterious, intimate and spiritual, which was just the opposite to that of Claude, Monet and Renoir (*See* PAINTING, MODERN)

Mary Cassatt.—After Whistler, the name that brought the most honour to the United States was that of a woman who found in impressionism the necessary atmosphere for her development Like Whistler, Mary Cassatt (1845–1926), surpassed her circle and, founding her method on his, using pastel both as an incisive instrument of drawing and as a means of obtaining fresh though sometimes heightened colour. She had a personal style with a frank and healthy sentiment in depicting mothers with their children and children in nursery scenes, which were her favourite subjects.

Sargent.—John Singer Sargent and William Dannat, contrary to the mysterious subtle and aristocratic Whistler and the intimate Mary Cassatt, represent all that is most exterior in painting—skill, broad vigorous sweeps of the brush and brilliant and fluid colour They both studied with François Carolus Duran. A few of Sargent's portraits in the Tate Gallery in London are comparable to those of Lawrence with somewhat greater depth and less facility, and he was a master of true water-colour. (*See* WATER-COLOUR PAINTING.)

Amongst landscape painters, George Inness must be mentioned as well as the Canadian W. J Morrice, who came under Whistler's influence in Paris. Walter Gay was more French in feeling and painted interiors that required no human presence to give an impression of life, with a charming distinction, but up to this time Whistler is the only American who had made an outstanding original addition to the treasures of universal art. His name dominates all others, as did that of Edgar Allan Poe in poetry. It is to be noticed as a curious fact explanatory of the genesis of America that the two brilliant personalities did not speak in the naive language one might expect from a young people, things unheard till then arose from two subtle and rather disabused souls who expressed themselves as though they had centuries of culture behind them

After a period of misunderstanding Whistler's influence was great in England and contributed to upholding the painters of that country in an aristocratic tradition It was also great in France and the effects are distinguishable in Eugène Carrière, Charles Cottet, Jacques Blanche and even Albert Besnard. An even higher French suffrage pleads before posterity for Whistler, that of Stephane Mallarme The poet of suggestion recognized in the painter of Nocturnes at least some part of the magic mystery which was to him the essence of art

EUROPEAN SCHOOLS

English School—End of 19th Century.—In England at the end of the 19th century the most distinguished painters were those influenced by Whistler's mysterious radiance Thus did J. W. Morrice paint his views of Canada, Paris and elsewhere. Thus also does Walter Sickert with his refined twilight palette

make from Whistler and Degas a personal mixture. In spite of his variation of colours, his violent contrasts of shadow and light and his romantic predilection for pirates and adventurers, Frank Brangwyn, painter and etcher, is also of Whistlerian origin. Wilson Steer is a landscape painter who used diffused light and broken colour to portray creations of brilliant imagination. Augustus John ushers in a new orientation, and henceforth Whistler is not thought much about for British artists have turned again to France, but with a determination not to lose their national accent. Thus the English school, though not maintaining the height it reached from Hogarth to Turner, keeps its independence. It almost ignored David, Ingres and Delacroix; the classic and the romantic, and even the impressionism had a rather late effect.

Belgium: 19th Century.—In spite of his virile genius, David was very nearly responsible for the emasculation of French art. England escaped this pseudo-classicism. Yet this same David, exiled as a regicide after the return of the Bourbons, spent the last eight years of his life in voluntary exile in Brussels, and by his influence helped to create a new school in this great centre where art now seemed on the point of extinction. If the name "Flemish" be reserved for the art of the great earlier masters it may be said to have been dead, but the moment that Belgium was gaining her independence a new school was born to flourish throughout the 19th century and promise future possibilities. (*See* DAVID, JACQUES LOUIS.)

François Navez (1787–1869), though he kept his liberty, became an admiring disciple of David, giving an individual rendering of the lesson of the master, just as Ingres was doing in France at that very time. His masterpiece "The Hemptinne Family" is not unworthy of comparison with some of the finest portraits of David and Ingres.

In Switzerland, notably in the case of Léopold Robert (1794–1835), David's influence plus a sugary realism hardened into pretentiousness and culminated in anecdote.

Decline of Romanticism.—The new Belgian school kept step with French painting, though it had not the benefits, unfortunately, of a Delacroix. Romanticism in a superficial form developed antiquarian imagery. Instead of an artist who, without care for a nice adherence to facts, reproduced in plastic form the emotion which meditations on the great events and heroes of history produced, there were only chroniclers who through petty details aspired to reconstruct little more than an authentic record. This spirit spread over Europe and brought fame to painters now relegated to oblivion. It started in France with Horace Vernet (1789–1863) and Paul Delaroche (1797–1855). In Germany it produced the Düsseldorf school of which Rethel (1816–59) is the most sincere representative, retaining something of the old Germanic spirit. Piloty (1826–86) and the Munich school followed. Its influence extended to the Slavonic countries and was prolonged to the end of the century by the Viennese Makart (1840–89) the Pole Matejko (1836–93) and the Hungarian Munkacsy (1844–1900). Gallait, a pupil at the Tournai Academy of the Frenchman Hennequin, himself a pupil of David, is of all these devotees of romantic imagery the one who most closely resembles Delaroche; but soon, in a similar formula as literary and falsely historical, Henri Layse (1816–60) showed by pictorial means that the old Flemish inheritance was not altogether lost, influencing humbler subjects like the little genre pictures of Madou and F. de Braekeleer. In the wake of these honest journeymen of the brush, under the influence of the French masters of 1830 and later of Courbet and Millet, Belgian painting returned more and more to that realism natural to the Flemings. Charles de Groux (1825–70) in his *Pilgrimage of St. Guido,* recalling Courbet's *Burial at Ornans,* blends this realism with sober sentimentality, a pity for the poor—to which Constantin Meunier (1831–1905) was to give new expression—showing at the same time a reality more external and intimate. Interiors were painted with or without figures by Henri de Braekeleer (1840–1888), rivalling Pieter de Hooch, Alfred Stevens (1823–1906) and Jan Steen, and at times expressing an ardour of emotion sufficient to justify his minuteness and wealth of technical virtuosity. Alfred Stevens was a society painter and more modern: his portraits of women generally show Parisians. Stevens was a friend of Manet and of French men of letters, and it was he who directed the artists of his country toward the movement *L'Art Libre.*

Landscape took an increasingly important place in painting. Hippolyte Boulanger (1837–74), who died too young, painted the forest glades with a vigour and naturalism derived from Théodore Rousseau and in turn fathered a succession of good landscape painters in French naturalism and impression: Émile Claus and Albert Baertsoen. The *Art Libre* movement was succeeded by what was known as the *Libre esthetique,* reacting to the influence of Paris and including symbolism as well as impressionism. The allegories of Léon Frédéric with their multitudes of figures are saved by their Flemish realism and their colouring, which is fresh to the point of crudity. Evenepoel, who died young, displayed the artistic gifts of a portrait painter. Félicien Rops (1833–1908) is more draughtsman than painter and some of his surreptitiously circulated work has won him a dubious celebrity. He was part, however, of that strange tendency which, currently with the realism characteristic of the time, carried an entire group of Belgian artists into visionary satire and mystic ideology. Henri de Groux combines the nightmares of delirium with dreams of the sublime. Eugène Loermans introduces Brueghel-like figures into his landscapes; but the greatest artist of this period and the only one who synthesized its confused or contradictory elements was James Ensor, who was fantastic, violent and subtle, the authentic creator of a new mode of feeling and as inventive in colour as in vision. From him derive the best of the succeeding generation from Rik Wouters to Constant Germeke. He held in their eyes an analogous position, though more variously endowed to that which the Austrian Kokoschka held in the art of Germany.

Holland, 19th Century.—In the middle of the 18th century the Dutch school seemed to be dying slowly of anaemia. There is no name worth mentioning after the death of Cornelius Vroost (1697–1750), a mediocre painter of amusing comic scenes. First, David's, at the beginning of the 19th century, and then the romantic influence was felt by way of Belgium, but both were lifeless and impotent. Two artists of this time had, however, a great influence on modern painting: Jongkind (1819–91) and Van Gogh (1853–90), and both by a curious chance or fateful instinct came to France in their youth where in truth their art is more native. Jongkind paved the way for impressionist landscape, for he was original though no theorist. At first he was the pupil of Isabey, but though gentle and childlike he was obstinate and independent. His water-colours which are perhaps the finest of his works aided him to discover a freer method. On his larger canvases his touch was heavy but his little pictures are so full of air and light and so freely handled that Jongkind is one of the most original artists of his age.

Van Gogh.—Van Gogh (*q.v.*), who appeared at the beginning of the impressionist triumph, wasted no time in imitation and made discoveries with which he expressed the mysticism and lyricism through which his vivid genius envisaged nature. Not the least surprising part of his story is that to only a few years of his short life belonged all that made him a great painter. He was already twenty-seven when he made up his mind to be a painter. Up to that time he had hesitated between art and religion but found it impossible to master the rudiments of theology. However, another side of his personality is shown in the most unbridled violence of his quarrel with Gauguin which ended in his cutting off one of his own ears, and another was the insensate act by which he terminated his life. But this madman had a simple goodness of heart and for a space of three or four years displayed genius. After wandering through Holland and Belgium in February 1886 he came to Paris and found the brilliance of French art. Then his originality blazed up like an explosive thrown into a fireplace. At Paris, at Arles and at Auver-sur-Oise he painted extraordinary pictures in composition, in colour and in feeling which will be the wonder and inspiration of many generations of painters.

During the romantic age another son of Holland, Ary Scheffer

WORK OF MODERN EUROPEAN AND AMERICAN PAINTERS

1. "Landscape in Southern France" by André Derain (1880–), French
2. "Every Saturday" by Arthur B. Davies (1862–1928), American
3. "Tormore" by Rockwell Kent (1882–), American
4. "The Way of the Cross" by Albert P. Ryder (1847–1917), American
5. "The Earring" by Ambrose McEvoy (1878–1927), English
6. "Ennui" by Richard Walter Sickert (1860–), English
7. "Emma and her Children" by George Bellows (1882–1925), American
8. "Intimacy" by Jean Edouard Vuillard (1868–), French
9. "Portrait of Dr. Schwarzenwald" by Oskar Kokoschka (1886– Austrian
10. "Rue d'Alésia" by Maurice Utrillo (1883–), French

JUNGLE PAINTING BY HENRI ROUSSEAU

"The Repast of the Lion" by Henri Rousseau (1844–1910), exponent of French folk-art. A naïve simplicity and directness like that of the primitives characterises his work. The illustration is from one of the many fantastic paintings of jungle life made by Rousseau during his last six years. Now in the collection of Adolph Lewisohn

1785–1858) became a Frenchman by adoption, but during the arlier and better part of his career he trod a little too closely in he footsteps of Delacroix, though his romanticism had his own ote of mystical sentimentality. He painted the *Souliot Woman* hree years after the *Massacre of Scio.*

About the time when Jongkind was leaving his country there ras at The Hague a group of good painters who followed with dmirable proficiency the path which they had chosen. These rere Joseph Israëls (1824–1911), Jacob Maris (1837–99) and is brothers, Willem and Matthijs; Anton Mauve, Bosboom, 3lommers and Mesdag. Of course, France had some influence; sräels studied Millet, and Maris, Mauve and Mesdag were ware both of Rousseau and Dupré, but whether painters of mndscapes or interiors they brought a sober and rather enigmatic nelancholy not unlike a kind of alliance of mysticism and realism vhich is the soul of the art of Van Gogh. All those who count or something in modern Dutch art, from Verz Cate (1858–1907) o Toorop, have followed the trail blazed by that unhappy genius.

Italy, 19th Century.—David's influence was not required to pread classicism in Italy, for it was in Rome that the classicism riginated by Winckelmann had its birth, and found an illustrious xponent in the sculptor Canova. Unfortunately, no painter of hat time produced any work comparable to those which in pite of his partiality to a certain academic grace, placed Canova n the ranks of great sculptors. Appioni of Milan has only a ertain scholarly aptitude. The Florentine Benvenuti (1769–844), a pupil of David's, is even more lifeless and Camuccini 1768–1844) is no less so. A romanticism not derived from Eugène Delacroix but from Paul Delaroche did not succeed in reathing life into this academicism and did no more than divert he art of painting towards sentimental anecdote of which *The Kiss* by Hayez (1791–1882) is the best example. Later, even vhen the school of realism known as "verism" took the place of cademic traditions, this spirit remained the goal of painters who vere otherwise quite efficient, such as Paolo Michetti, Ettore Vito, and Emma Ciardi. The last is the name of a woman and t is in her work that the lyrical note is most clearly heard. The im of these painters differs little from that of the contemporary Spanish virtuoso, Fortuny. De Nittis (1846–84) though less kilful in technique, was a true and delicate artist who caught he atmosphere of Paris where he lived most of his life. But the ionour of Italian art in the 19th century is vested above all in hree men of much stronger personality, who kept apart and ollowed their own dreams without thought of immediate success: Antonio Mancini, master of impasto and of painting in polyhrome touches, who attained an element of mystery in this echnique; the austere Segantini (1858–99), the apostle and iermit of the mountains to whose harsh grandeur he gave expression: and Antonio Fontensi (1818–82), landscape poet, who s not without affinity to Ravier of Lyons.

French School, 19th Century.—In France the reaction igainst the too rigorous authority of David began while he still ived. Prud'hon (1758–1823), who had neither the force nor iuthority of David but who had charm and almost feminine ensitiveness, preserved the treasure of French tradition and iardly acknowledged David's ascendancy. Prud'hon was also enthusiastic for the antique, but his viewpoint was that of the elegiac poet rather than the archaeologist. His portraits of vomen resemble the Muses and yet acquire that most living expression of the particular charms which these women had in he eyes of their lovers. Delacroix has justly devoted one of his est essays to him, for Prud'hon before Gros and Géricault, prepared the way for the reaction against David, which, thanks o the genius of the painter of the *Massacre of Scio* and of the *Barricade,* restored in France the true principles of the fine art of painting—suppleness of composition, charm of touch, richness ind harmony of colour.

Gérard (1770–1837), in his allegorical and mythological composition is still academic, but once at least when he painted a celebrated canvas *L'amour et Psyché* (Cupid and Psyche) he ichieved elegance and charm. This charm lends value to his portraits which are the best part of his work, more especially those of women, *Mme. Récamier* (Museum at Versailles), *La Comtesse Regnault de Saint-Jean d'Angely* (Louvre), and in the painting of Isabey with his little daughter, he almost equalled the true masters of portraiture. Gros (1771–1835) was more forceful and a master technician with a feeling for drama. There is true tragic grandeur in his vast canvases *Pestifères de Jaffa* and *La Bataille d'Eylau* in which he appears as the authentic precursor of romanticism and of Delacroix. But a curious fidelity made him fall under the influence of David and paralyzed his natural impulses in the latter part of his career. Géricault (1791–1824) had the stuff of a great artist in him and found under David's influence the foundation of classic art into which he breathed passion and life, but unfortunately he died too soon (*See* GÉRICAULT.) *Le Radeau de la Méduse* (1819) proves what he would have been, as does his painting *The Derby at Epsom* which was the happy result of his journey to England in 1821

Delacroix.—These three artists understood and encouraged a young man destined to become one of the great French painters, Eugene Delacroix (1798–1863). There is not one of his early works in which there is not evident the influence of Géricault, not excepting the finest and most original from *La Barque de Don Juan* and the *Massacre of Scio* to *La Mort de Sardanapale,* and even to that masterpiece which seems without a precedent, realistic and lyrical at the same time, the *Barricade,* but his passion is less physical; its springs are loftier and more complex than were those of the painter who so influenced him. Delacroix had the advantage of being a great intelligence as well as a great painter and was predisposed to critical analysis and psychological introspection not entirely necessary to artistic genius. He was not content to publish writings about art and artists nor with being its brilliant talker in the salons of his time, loved and admired by some and feared by others. He has left us a book, his *Journal,* in which at more or less regular intervals he confided his thoughts, and which forms a book that links up Delacroix with such writers as Montaigne and Stendhal as well as being a sincere confession of his moral, spiritual and intellectual life. There was at the same time in France another favoured artist, Baudelaire, who by a rare coincidence first understood and explained Eugène Delacroix's genius, and his profound and brilliant pages are the masterpiece of art criticism in the 19th century. This duality of poet and critic blended into harmony in both artists marks them as being among the elect. (*See* DELACROIX, EUGÈNE.)

The rivalry between Ingres and Delacroix occupied nearly the whole of the first half of this century and the champions of classicism in the controversy which arose claimed to be the defenders of order, and accused the romantics of anarchy. In reality, however, romanticism was an inspiration toward some liberty, poetry and lyricism Ingres himself was romantic and Delacroix repudiated the title of leader of a school and prided himself on being a pure classic. Nor was he wrong and it might be said that in spite of appearances and the honest belief of contemporaries the more classical of the two was he who was both acclaimed and decried as the leader of the triumphant revolution

Ingres.—Ingres (1780–1867) made a brilliant beginning at portrait and historical painting under the influence of David, and there is a picture of the Horatii which bears their combined signatures, but Ingres soon emancipated himself and in 1805 he painted the portraits of *Monsieur, Madame and Mademoiselle Rivière* (Louvre) and *La Belle Zélie* (Rouen Museum), showing an original talent which is a little mannered but with a manner full of charm and the undulating delicacy of line which is as far as possible from the harsh realism which gives strength to David's portraits. Ingres was the high-priest of the cult of Raphael and a great admirer of the classic sculpture of Greece and the masterpieces of the Italian Renaissance, but his secret preference was for those little objects which are not without a certain preciosity: intaglios, cameos and Greek vase paintings, at that time called "Etruscan." He was one of the first to collect the works of the painters of the *Quattrocento* which were inexpensive at that time and it was his taste for the archaic and curious which his unfriendly contemporaries were criticising when they called him a "Goth" and a "Chinaman." The sculptor, Preault, said that he

was a "Chinaman astray in Athens." There is a certain strangeness in some of the finest works of Ingres. A pedant looking at the back of the *Grande Odalisque,* the neck and arms of Thetis in the picture *Jupiter and Thetis* (Aix Museum), the neck of Angélique in the picture in the Louvre where that lovely victim is rescued by Roger, and certain exaggerations of form in the *Turkish Bath,* would cry out at the faults of drawing in this incomparable draftsman but they are not faults. These elongations and distortions, these slender and fragile arms, distended throats, which appear to be cooing like turtle-doves, are the means, though mannered, with which an artist of extreme sensibility has attempted to translate his passion for the bodily beauty of women. In the assembling of a large number of figures, such as the *Apotheosis of Homer* or the *Age of Gold,* Ingres never attained to that ease and freedom, vitality and unity which claim our admiration in the superb decorative compositions of Eugène Delacroix, but in those pictures in which he depicts a single image, erect or recumbent, of that female form which was the enchantment and torment of his whole life, there is an original taste and aptly fertile invention. *La Grande Baigneuse, Venus Anadyomene* and the *Source* are not unworthy of being set beside the most radiant daughters imagined by the painters of Italy.

An ardent docility of nature explains why Ingres was a great portrait painter, one of the greatest that France can boast of, and his technique in precision was suited to this art which he rendered not only with great accuracy in faces, figures and costumes but in which he revealed the intimate secrets of the soul. Finally, his original efforts placed him beyond the flat and harsh colouring which the critics often censured in other works. Such pictures as *Bertin l'Aîné* and *Mme. de Sénones* are solid, profound masterpieces which need never fear to face the caprices of popular taste. (*See* INGRES, JEAN.)

The development of landscape painting is one of the most significant features in French painting of the 19th century. "Historical" landscape painting was soon disavowed by Rousseau, Dupré, Huet, Decamps, Flers, Cabat, Diaz, Troyon, Chintreuil and Daubigny, who represented nature in a grand or familiar aspect. Millet, too, should be added, though he was late in beginning to paint pictures in which landscape was the principal feature. They commenced to paint the country about man as he appeared in the clothes and attitudes befitting labours in the fields. Some of them were hardly known to Paris, such as Ravier, of Lyons, and Morestel. This group also banished from the realms of art the literary and historical scene and even discredited attempts at intellectual seeking in composition. However, they equalled the Dutch landscape painters of the 17th century and one man rose above his peers.

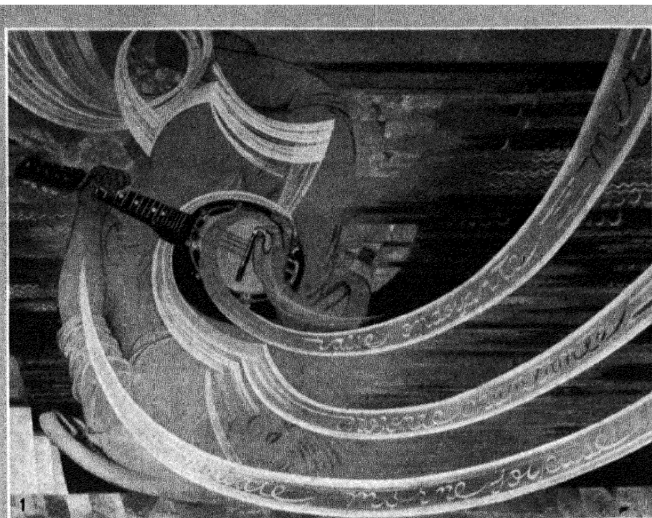
Rousseau.—Théodore Rousseau (1812–62) is a French Ruysdael. He profited from the works of Delacroix, but in him there was a philosophical spirit which lends to even his minute work an appearance of austere grandeur. Beginning with almost scientific analysis, Rousseau ends in generalizations which turn the edge of the forest or a mass of chaotic rocks into a microcosm expressing terrestrial force. One would think that before painting the trees of his forests at Fontainebleau he approaches them, touches them with his hands, feels them, and measures them, while his spirit senses the pulse of the world.

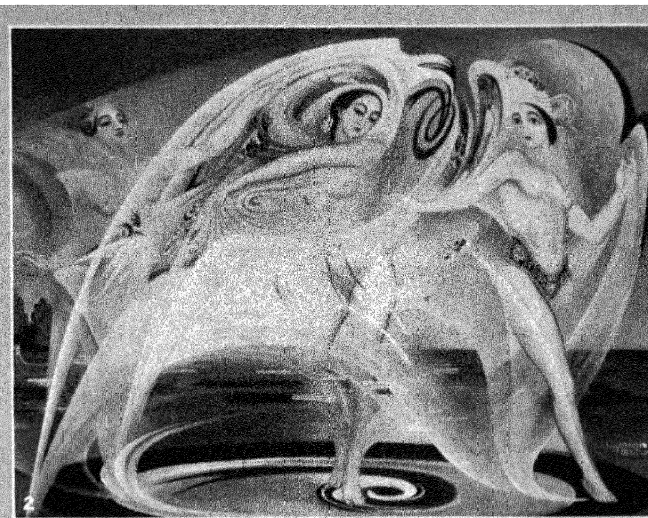
Corot.—Corot (1796–1875), in spite of appearances, was not entirely foreign to this group of landscape innovators. He belonged to another generation, but the leaders of the new school accorded to their elder all the marks of great deference as much on account of his enduring simple goodness as on account of the perfect dignity of his life. Yet they would doubtless have been surprised had they been able to see how posterity has admired the most delightful landscapes painted at that time. The writers of the period poured their sarcasm upon Bidault and Bertin, who was Corot's master and held in high regard by his pupil. Corot's position with regard to the innovators is analogous to that of Eugène Delacroix and his relationship to Ingres. Corot is perhaps the most thorough classic French painter of the century, though he was also prompted by a humble devotion to nature and even in his mythological or allegorical paintings, such as *Danse des Nymphes, Diane au bain, Concert Champêtre, La Toilette,* he lends a fresh sincere quality of life to the noble inspirations springing from Poussin and Claude Lorrain.

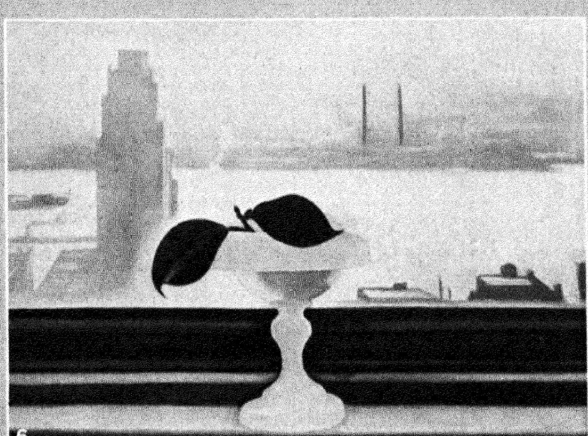
Whether they recognized it or not, Manet and the impressionists, Cezanne and those who reacted against impressionism, as well as those like Puvis de Chavannes, who attempted to find a new classic order in the association of human figures with landscape, are tributary to the painter called the "*bonhomme Corot*" just as in the 17th century they said "*bonhomme La Fontaine.*" They all derive from Corot, who, setting up his easel out of doors in 1826 and 1830, painted *Forum Romain* and the *Cathédrale de Chartres* and forty-five years later with the same young heart painted *le Beffroi de Douai.* (*See* COROT, JEAN BAPTISTE CAMILLE.)

Millet and Daumier.—Millet (1814–1875) and Daumier (1808–1879) introduced the painting of manners not in the form of anecdote as in genre painting but with a dignity previously found only in the works of Chardin and the Le Nain brothers, and in Eugène Lami (1800–1890), before reaching Meissonier (1815–1891), who is one of the most extraordinary, most precious, most impeccable virtuosos of painting without a soul. Doubtless there was mingled in both Millet and Daumier (*qq.v.*) a little of that mystic humanitarianism which inflamed many hearts in the year 1848. It was this which made Delacroix and Baudelaire mistrustful toward Millet, who painted in an epic style the peasants labouring in their fields and following their domestic lives. Millet expressed himself by saying, "A peasant I am, a peasant I shall die." He had meditated on the Bible and on Virgil. He became a student of the most differing masters but was especially devoted to Michelangelo and Poussin. Beginning with painting in the romantic manner, very lofty in tone, little by little he divests himself of the unessential, simplifies his drawing and colour, but always preserves through study his contact with nature. He is one of those rare beings who have engendered in the life of art the subjects of their inspiration and have created at the same time a language without which this inspiration could not have been communicated to the world. This task is so difficult that one must not be surprised if there is at times a certain laborious painful quality, a kind of heaviness or dryness in his paintings; but his drawings are always forceful and graceful as are his water-colours and etchings. His oil paintings which were entirely composed in the studio are rather the creations of a reflecting will assisted by memory methodically applied. *The Gleaners* is perhaps the most consummate example of this bare art, almost meagre, chosen to deliberately express in all its primitive power profound, grave, and primitive feeling. After 1865 he slightly modified his manner, developing more freedom, more suppleness and more clearness. The pastels increased in number and landscape painting became more and more important. In *Le Printemps* there is a perceptible attempt to seize an effect of light as the impressionists do, a fugitive effect and an exceptional effect which has never before been observed nor represented with so much truth. In it there is no symbolic figure, but swift drama extending from sky to earth: the rainbow is painted against the storm and makes the young foliage wet with rain gleam and seem detached, almost as if varnished against the dark background of the sky where fleecy clouds are floating. (*See* colour plate LANDSCAPE PAINTING.) But Millet does not seem in the least affected by the new movement in impressionism. He did not like to be associated with Courbet, and Courbet did not trouble himself about this comparison. He probably did not see what the young painters in the group around Manet were doing, nor did the impressionists seek in his example any support for their theories. It is a curious fact that it is rather Puvis de Chavannes who was indebted to Millet for he was struck by the harmony, which was new at that time in the *The Gleaners,* between a true landscape and sculptured figures with simplified gestures.

Daumier in a longer life but a life consumed by the demands of lithography could unfortunately devote only brief hours to painting. He has left few canvases and still fewer completed paintings, but they are animated with such a spirit of life, they are composed







BY COURTESY OF (3) MRS. PAUL REINHARDT, (4) JOSEPH STELLA, (5) MRS. FRANKLIN LOCKWOOD, (6) ALFRED STIEGLITZ, (7) THE FERARGIL GALLERIES

PAINTINGS SHOWING THE NEW INTEREST IN RHYTHM

1. "Méditerranéenne" by Louise Janin. Images of things normally separated, coalesce to evoke a familiar mood that the lilting rhythms intensify. The viewpoint is from above looking down on a seated figure
2. "Ballet" by Louise Janin. The rhythms of the dance are suggested by abstract "veils"
3. "Two Girls" by Marie Laurencin. The repetition in form creates a pleasantly passive rhythm
4. "The Bridge" by Joseph Stella. An excellent example of the beautiful rhythms to be found in modern construction
5. "Blue Dancer" by Maurice Sterne. A similar use of forms to Fig. 2 but less extensively carried out
6. "Pink Vase with Green Leaves" by Georgia O'Keeffe. Contrasting two rhythms, the vase and leaves in flowing curves and the background in straight horizontal and perpendicular arrangement
7. "Into the Moving Night" by Arthur B. Davies. One of the most successful uses of abstract rhythmical forms applied to the human body

on such a structure of design, so expressive and so true does his brush apply the colour and with such imperious intensity, that nothing more could be wished for in these powerful rough drawings.

It was at the beginning of 1848 that Daumier made his public appearance as painter, taking part in the competition which had been announced by the management of the Department of Beaux-Arts, for a figure representing the Republic. His sketch which one can see in the Louvre was a powerful woman seated on a throne, with head erect. She holds the tri-coloured banner in her hand and is nursing at her breasts two hearty infants. Daumier's *La République* has a certain similarity to Millet's which expresses the bonds of sympathy which naturally united these two men. They resemble each other particularly in the quality of design and in their search for a certain secret grandeur in familiar objects.

Daumier is at bottom more completely a painter than Millet, and his technique approaches more nearly that of Decamps (1803–60), whom he admired and who is neglected to-day because of the tedious virtuosity of his genre painting. Also Daumier prefers to show peasants in a *Wagon de 3e classe* rather than in their native fields and he observes them with the mocking eye of a city dweller. His landscapes too were unimportant and none were done directly from nature, though some of his pictures such as *Emigrants* show invented horizons in tawny tones as do also his numerous *Don Quixotes* in drawings, water-colours and oils.

Daumier loved the cities and the people of them and he was, perhaps, the first to explore in the strange world of the theatre, with its noble, tragic and ridiculous passions. His chief work, the *Drama,* shows an understanding of both the spectacle and the audience. The effect of the footlights interested him, for he was always looking for novelty in his work. An artist before his easel, a laundress bending under her load, or any other human subject interested him, and with a perfect ease in a stroke of the brush, a gesture which seems involuntary, or a wrinkle around the eyes or mouth, he reveals to us secrets which were at that time still unknown after all the centuries since mankind first became the proper study of man, and thus he had affiliations with Manet, Degas and Lautrec. As Romanticism ruled the first half of the 19th century, so does Impressionism in the following period, and it was Gustave Courbet who, although not without a certain romantic effervescence in his naïve and confused soul, was to become the ensign-bearer of those who felt that Romanticism had come to an end with all its dramas of history and Oriental picturesqueness.

Courbet.—Gustave Courbet (1819–1877) seemed at the beginning to follow the manner of painting of the old masters, and in his large, robust style he naturally opposed the imitators of Delaroche. Thomas Couture (1815–79) began with similar endowments but if Courbet's head was not very steady Couture's was even less so, for though he only did excellent bits he believed he was a modern Veronese, and the success of his immense canvas *Les Romains de la Décadence* served to make his error irremediable. His future career became a succession of plans and failures. It was Courbet's misfortune, on the other hand, to encounter certain metaphysicians and aestheticians of realism, and had it not been for these he would probably have continued to produce masterpieces of good painting without any indirect purpose, such as *l'Homme à la ceinture de cuir, l'Après-dîner à Ornans, l'Enterrement à Ornans,* and *les Demoiselles de la Seine,* and the world would have gained by this as well as himself.

A misunderstanding between artist and public dated from about 1830, which seems almost monstrous to-day, developed and became the rule in their relationship. Delacroix was the earliest of the illustrious victims. He was disdainfully amazed at the malice and unfriendly stupidity of the things that were being written and said. Corot was treated in a different manner. There were little or no polemics in his honour. The canvases which he sent to the Salon were hardly noticed. That genius may not be perceived is understandable, but at this time France showed hostility rather than indifference and did not recoil from any means to travesty the great artists of the day and make them something grotesque or odious. Courbet, however, attracted the attention of Ingres and Delacroix who admired his skill, and in spite of the fashionable groups who felt that his subjects were too vulgar, satisfactory relations might have been established between himself and the public, but Courbet under Prud'hon's persuasion allowed the social revolution to turn his head and felt that he had a mission to fulfill in employing his brush for the emancipation of the people. But luckily he forgot Prud'hon most of the time. He gained the respect of public officials and had the satisfaction of repelling them ostentatiously. But when the uprising actually took place it was no longer a case of showing one's colours. It was necessary that he become a revolutionary in deeds. After the victory of the regular government he came out of prison, unhappy, exhausted and broken in spirit and went to Switzerland where he dragged out his last days. *L'Atelier* represents his greatest effort and is one of those audacious paintings which in spite of bizarre and incoherent features may be ranked among such masterpieces as Rembrandt's *The Night Watch.* No one has ever equalled him in representing the mysterious influence of music on people as he has done in *l'Après-dîner à Ornans.* Who has ever revealed as he has done in *la Curée* or in *La Remise des chevreuils* the elemental poetry of a winter evening falling upon triumphant hunters in the solitude of the forest or in the mist of snow? And thus he stands unrivalled in his own age and perhaps in his century.

Ricard (1823–73) and Monticelli (1824–86) had rich and learned technique and though they were both interested in tonal graduation, harmony and contrast, the expression of a spiritual ideal was the main aim to which they devoted themselves, which to Monticelli meant visions of strange princesses walking in fairy parks and to Ricard the divination of the depths of the soul. Fantin-Latour (1834–1903), whose career ran parallel with the impressionist movement was the painter of middle class family groups. Among painters still living, Ernest Laurent, who, with Aman-Jean was a product of the post-impressionist group in which Seurat was evolving the elements of the new style, was to be the tender and subtle interpreter of the feminine soul.

Russia, 19th Century.—Until late in the 19th century modern Russian painting was unknown to western Europe. What had been seen of it in international exhibitions showed the traditions of primitive European art, with a distinct vein of barbarism. In the early 'fifties, painters were less bent on art than on political agitation; they used the brush as a means of propaganda in favour of some political idea. Peroff showed us the miserable condition of the serfs, the wastefulness and profligacy of the nobility. Vereschagin made himself the advocate of the soldier, painting the horrors of war long before the tsar's manifesto preached universal disarmament. Art suffered from this praiseworthy misapplication; many pictures were painted, but very few rose to the level of modern achievement in point of technique. It was only by the St. Petersburg art journal *Mir Iskustwa,* and by a small exhibition arranged at Munich in 1892 by a group of Russian landscape painters, that it was realized that a younger Russian school had arisen, fully equipped with the methods of modern technique, and depicting Russian life with the stamp of individuality. At the Paris Exhibition of 1900 the productions of this young Russian school were seen with surprise. A florescence similar to that which literature displayed in Pushkin, Dostoievsky and Tolstoy seemed to be beginning for Russian painting. Some of these young painters rushed into art with unbridled zest, painting with primitive force and boldness. They produced historical pictures, almost barbaric but of striking force; representations of the life of the people full of deep and hopeless gloom; the poor driven by the police and huddled together in dull indifference; the popes tramping across the lonely steppes, prayer-book in hand; peasants muttering prayers before a crucifix. There is great pathos in *The Karamasow Brothers,* or *The Power of Darkness.* At the same time we feel that a long-inherited tradition pervades all Russia. We find a characteristic ecclesiastical art, far removed from the productions of the *fin de siècle,* in which the rigid tradition of the Byzantines of the 3rd century still survives. And, finally, there are landscapes almost Danish in their bloodless, dreamy tenderness. Among the historical painters Elias Repin is

the most impressive In his pictures, *Ivan the Cruel, The Cossacks' Reply to the Sultan,* and *The Miracle of Saint Nicholas,* may be seen—what is so rare in historical painting—genuine purpose and style. Terror is rendered with Shakespearean power; the boldness with which he has reconstituted the past, and the power of pictorial psychology which has enabled him to give new life to his figures, are equally striking in *Sowing on the Volga* and *The Village Procession.* He was the first to paint subjects of contemporary life, and the work, while thoroughly Russian, has high technical qualities—the sense of oppression, subjection and gloom is all-pervading But he does not "point the moral," as Peroff did; he paints simply but sympathetically what he sees, and this lends his pictures something of the resigned melancholy of Russian songs. Even more impressive than Repin is Philippe Maliavine. He had rendered peasants, stalwart figures of powerful build; and, in a picture called *Laughter,* Macbeth-like women, wrapped in rags of fiery red, are thrown on the canvas with astonishing power. Among religious painters Victor Vasnezov, the powerful decorator of the dome in the church of St. Vladimir at Kiev, is the most distinguished figure. These paintings seem to have been executed in the very spirit of the Russian church; blazing with gold, they depend for much of their effect upon barbaric splendour. But Vasnezov has painted other things: "The Scythians," fighting with lance and battle-axe; horsemen making their way across the pathless steppe; and woods and landscapes pervaded by romantic charm, the home of the spirits of Russian legend. Next to Vasnezov is Michael Nesterov, a painter also of monks and saints, but as different from him as Zurbaran from the mosaic workers of Venice; and Valentin Serov, powerful in portraiture and fascinating in his landscape. It is to be remarked that although these artists are austere and unpolished in their figure-painting, they paint landscape with delicate refinement.

Schischkin and Vassiliev were the first to paint their native land in all simplicity, and it is in landscape that Russian art at the present time still shows its most pleasing work. Savrassov depicts tender spring effects; Kuindshi light birch-copses full of quivering light; Sudkovski interprets the solemn majesty of the sea; Albert Benois paints in water-colour delicate Finnish scenery; Apollinaris Vasnezov has recorded the dismal wastes of Siberia, its dark plains and endless primeval forest, with powerful simplicity.

A special province in Russian art must be assigned to the Poles. It is difficult indeed to share to the full the admiration felt in Warsaw for the Polish painters. It is there firmly believed that Poland has a school of its own, owing nothing to Russia, Austria or Germany; an art which embodies all the chivalry and all the suffering of that land The accessories are Polish, and so are the costumes. Jan Chelminski, Wojcliech Gerson, Constantine Gorski, Apolonius Kendzrierski, Joseph Ryszkievicz and Roman Szvoinicki are the principal artists. We see in their pictures a great deal of fighting, a great deal of weeping; but what there is peculiar to the Poles it is hard to discover

IMPRESSIONISTS

Manet.—Manet (1832–83) was attacked by the press and regarded as a revolutionary and this group, Degas, Renoir, Monet and the rest, including Cézanne (*see* CÉZANNE) who stands a little apart, were deluged with the sarcasm of the critics. (*See* following article, PAINTING, *Modern.*) How was it that in this century the breach continually widened between the artist and the public? Formerly the artist had worked for a select class, for a king, for princes, for a court, or his other noble patrons of art and he found no difficulty in adapting himself to the needs and wishes of that select class. The artist because of his superior gifts was better understood by aristocracy though he may have suffered from their caprices and arrogance But the coming of democracy changed all this, and the public to whom he must make himself understood no longer represents the highest civilization of the day, with tastes similar to his own. The artist may be the child of the people but nothing can efface the brilliant sign which he wears on his brow, and even in the midst of poverty and misery he is a privileged being. Therefore, as such, he is a suspect. Thus true artists gradually passed from anger or regret to contempt or indifference, and they no longer strove to be understood except by a small number of initiates, endowing their works with a secret and esoteric character. Some good may arise for art out of this false situation, for by being isolated and being driven back upon himself the artist has thought himself justified in concentrating on the one thing which seemed to him as essential—the development of his own personality, and if tendencies toward eccentricity, aestheticism and abstraction are to be feared, never, on the other hand, has there been seen such originality as that evident in the works of Manet, Degas, Cezanne, Renoir, Monet, Berthe Morisot, and, in the next generation, Gauguin, Van Gogh, Seurat, Lautrec.

Degas.—Degas (1834–1917) contemporary of Manet and man of the world, though at the same time solitary, was more reserved, deeper, more restless and less happy. He is perhaps the only painter of the 19th century deserving to be placed not far from Delacroix in the category of great minds and had not only creative imagination but a gift of critical analysis. Manet and Degas had some of that universality which characterized the great artists of the Renaissance and we feel that had destiny not permitted them to be painters they would nevertheless have been leaders. After their time particularism becomes more dominant.

Degas was less impressionist than Renoir and was really a draughtsman to be compared with Holbein and Dürer. He was a painter of dancing girls, laundresses, women at their toilet, modistes, singers, café-concerts, and jockeys as well as horses, seizing in each, with an extraordinarily definite and expressive brush stroke, certain gestures or movements which the eyes of painters had not noted until that time. He was an amazing portrait painter achieving an impression of a striking unvarnished truth. Moreover, he had important effects in the development of modern painting through his experiments in technical execution.

Morisot.—Berthe Morisot (1841–95) was one of the impressionists who showed the most original woman's talent of all times, due undoubtedly to the fact that this woman of the upper class did not try to be a man but remained a woman, and a woman of the world.

The name of impressionism (*q.v.*) had been bestowed upon this group by chance and in derision, but they soon accepted it as a rather apt rallying-cry and it became charged with a philosophical meaning extending beyond the field of painting. It had the distinction of exasperating the opposition which chose to forget that it had invented the name It was attacked with violence. People saw a school whose followers seemed to obey a mysterious rule and practise a new method of painting which disconcerted the *habitués* of the *salons* and even of the museums. They made little distinction between the painters and took as criteria only those three methods—*plein air* (out-door painting), *peinture claire* (painting of light) and *division du ton* (breaking up or separating of colours), though we to-day on the contrary particularly admire the individual distinction of these artists, while impressionism as the doctrine of a school interests us comparatively little.

Renoir.—Renoir (1841–1919) showed an affiliation with Delacroix. He was the most sensitive imaginative and richly endowed colourist of the group and he openly declared that *les Femmes d'Alger* was one of the finest paintings in the world, and it was this which inspired his first attempt at an important composition.

Monet.—Claude Monet (1840–1926) is the true founder and only teacher of this so-called school and he exercised extraordinary authority upon his comrades, but what we love in him to-day is his brilliant genius as a colourist, his ingenuous feeling for feminine charm that is a trifle animal but very young and healthy, his desire for abundance in composition, all of which was quite contrary to the principles of impressionism.

Cézanne spent a term of his career in impressionism and then turned even farther away from it than Renoir when he proclaimed that they "must return to the ancient masters by way of nature" and that they "must make of impressionism as firm and lasting an art as that of the museums." (*See* CÉZANNE.)

To whom, then, can we accord the right of fully representing the name of impressionist? There remain only the pure landscape painters, or those who were first and foremost landscape

painters—Monet, Pissarro (1830–1903), Sisley (1839–1899), and indeed at one time so nearly alike did these three paint that without seeing the signature it was difficult to tell from which source a canvas had come, though with their best works this was of course not the case. Sisley was in no sense a theorist, but a charming minor poet of the country and the seasons in the spirit of the gentle Lépine (1835–92) and the good Corot himself. Monet's passion and energy made him, against his original intentions, a visionary and a lyric poet.

Pissarro too did not adhere strictly to pure impressionism and even in certain of his paintings where a first glance reveals only his preoccupations with technique, we discover his will toward order and organization which the doctrine of impressionism did not encourage. Because of this he was worthy of the curious and glorious rôle of mingled actions and reactions which he played by turns next to Cézanne.

It would, however, be an injustice to impressionism to deny that in spite of the defeat of its doctrine it has bequeathed precious acquisitions by which painters have profited and will continue to profit whatever their conception of art, and their vision of nature and of life.

Seurat.—Seurat (1859–91) as expressed by the very name of his technical invention *Neo-impressionism* owed much to Claude Monet. This technique consisted of an almost scientific systemization of the division of colour. To-day all these differences are only external aspects of the same thing in our eyes but we recognize Seurat's personal contribution, the force and dignity of his art; and his intellectual reaction was necessary at this time

Chavannes.—Puvis de Chavannes (1826–98) was endowed with a genius for monumental painting and it has been shown how his technical influences and achievements as a colourist were kept alive in the art of impressionism.

Gauguin.—Paul Gauguin (1849–1903) found his point of departure in the combined influences of Puvis de Chavannes and impressionism His character, life and work are alike marked by contrasts which were doubtless in his blood from his birth and the characteristic features of his power are summed up in his father, a little French *bourgeois* and journalist of liberal leanings and in his grandmother, the beautiful, passionate, adventurous Flora Tristan, born in Peru of a good Spanish family, who in France became an apostle of Saint-Simonism and of revolution. Gauguin after being in the navy and in finance became a painter late in life with a fierce violence and a mingling of brutality and refinement, of impetuousness and reflection. He boasted of being a savage and settled in Tahiti where after years of fury and enchantment he died in wretchedness Initiated by Pissarro into the secrets of impressionistic vision and technique he later met at Pont-Aven, in 1886, Émile Bernard who had invented a method called *synthesism* or *cloisonnism* based on the simplification of design and colour, using flat areas of colour with strongly defined outline, giving an effect similar to enamel or stained glass. The movement which was first called *Symbolism* sprang from Gauguin rather than from Cézanne.

Eugène Carrière (1849–1906) tried to make the emotional significance of painting supreme and even went so far as to dispense with colour. Vincent Van Gogh (1853–90) applied paint with violent impast while Henri de Toulouse-Lautrec (1864–1901) applied it as lightly as one does a pastel, but in both cases the whole is made up of striped and hatched tones. Yet the brilliant and irreducible originality of Lautrec as a draughtsman and as a biting satirist, and the unequalled colouring and daring invention of powerful pictorial hallucinations of Van Gogh make them interesting.

At the conclusion of a survey of this agitated period it is evident that it is individual artists and not schools which must be examined. It is impossible that schools could exist in our day and it will be long before the traditions of a fine art or craft will be transmitted and perpetuated from master to pupil for personality asserts itself more and more clearly. Thus we realize how much painting has become transformed in the course of the century since the time when it was scarcely separated from sculpture and architecture which have been governed by basic laws. The mediums of music and painting are infinitely more flexible and indeterminate. Apparently the field of suggestion will open up without limit for painting as for music until at last following our present stage of evolution painting will become music, and music, painting. (*See* Biographies of Painters.)

MODERN PAINTING

The first twenty-five years of the 20th century have been marked by an extraordinary ebullition in art. Formerly, art movements, even in France, progressed in a more or less leisurely way, reaching a logical conclusion. They attained their zenith and declined as their interest waned, as stimulus was lost and the principles they practised degenerated into mere formulae. This was followed by a reaction and a new movement came into being

The classicism of David and his disciples was succeeded by the romanticism of Delacroix, Géricault, Delaroche, etc., and in landscape by the Barbizon School (*q v*) of *plein air* with Corot, Rousseau, Daubigny, etc. At the same time the Realist movement with Courbet at its head, was developing. With Courbet were Daumier and Millet; or the latter may be said to have belonged to both groups, as it was not always possible to separate completely one from the other.

The school of Corot developed, under the impulse of certain discoveries made by Chevreuil concerning the simultaneous contrast of colours, into the Impressionist movement (*see* Impressionism) with Monet, Manet, Pissarro, Sisley and others as the chief exponents This movement had a very far-reaching influence on modern art, as it introduced a fundamental change in colour perception, in the treatment of light and atmosphere, and changed the point of view of painters in regard to art and nature.

At the beginning of the 20th century, the direct influence of Impressionism as a creative force of a marked character was on the decline. Its true influence had been absorbed and was no longer a separate activity. In the hands of painters like Maufra, Moret

and Loiseau it had degenerated into a formula, not without charm, but no longer life-giving or inspiring.

Neo-Impressionism had proved itself in the hands of Georges Seurat, a sensitive and even flexible medium for the expression of minute truth of atmospheric and light effects not only in landscape but even in groups of figures on a large scale. It appears to have been a highly personal method which ended with Seurat, who was its greatest and most perfect exponent. As practised by Paul Signac it degenerated into a formal and almost mechanical use of a fantastic and unrealistic nature and far removed from its original purpose which was the realisation of the exact truth of natural conditions at a given moment.

There were other painters who practised *pointillism* more or less incidentally, such as Maximillian Luce, Theo van Rysselbergh and even Camille Pissarro employed it, with beautiful effect on a few canvases.

Although Ernest Laurent, La Sidaner and Henri Martin adopted a variation of the method for pictorial purposes, theirs was not a true *pointillism* and the end was no longer inevitably related to the means.

Influence of Cézanne.—The true development of Impressionism was quietly proceeding in another direction through the work of Paul Cézanne, who had been a pupil of Camille Pissarro, from whom he had learnt the principles of Impressionism in their strictest form. Cézanne died in 1906 but he, even more than any other painter, has influenced the art of the present day; not only in his own country but throughout Europe and America.

Cézanne gradually discovered what was the inherent weakness of Impressionist art; its lack of solidity and, frequently, of design. His determination to give to art—meaning—"Impressionist art as he felt it"—"The solidity and enduring quality of ancient art"—"Of the art of the museums" has been often quoted. His principles have been usually misunderstood and misapplied. The path that angels fear to tread has been trampled by the feet of most of the younger artists of the day.

Cézanne approached his solidarity by way of the most subtle and refined colour analysis and he produced pictures of landscapes and figures, interiors and portraits, of a rare beauty in which the perception of colour is almost incredibly sensitive and profound. His imitators have produced ugly pictures, coarsely treated, in which the colour approximates, as nearly as possible, to that of mud. They have, on occasion made a method of his mannerisms—as has happened so often before in every branch of art. If Cézanne used a blue outline to correct or recover his drawing then the canvases of his imitators were covered with blue outlines.

The twentieth century opened, then, with the waning influence of Impressionism and the growing influence of Cézanne, the child of Impressionism, who had but recently, and late in his life, received recognition.

POST-IMPRESSIONISM

Development in France.—Modern art in all countries is essentially French. All the movements, great or small, have originated in France. France is like a great central fire sending sparks all over the world which fall on a variety of fuel and burn with varying force and character. It is therefore but logical to consider France—the home of strange-isms—before other countries.

The demand for something new on the part of young artists is natural and inevitable. The old is no longer stimulating or exciting. But the new has no intrinsic value as such. No work of art has survived merely or mainly because it was new in its time. Novelty has a value, a different value—it may lead to something that is fundamentally and universally important. Usually it does not. But at least it keeps art alive and excites interest, which is not bad for art. But posterity, or should it be eternity, demands something more.

The first twenty-eight years of the twentieth century have been remarkable for the number of new movements that have arisen. Some have sunk and left no traces, others have modified or changed the direction of art to some extent. But it must be remembered that art—the essential art—goes on inevitably. Velazquez and El Greco may be the chief or only survivors of the Spanish art of the 16th and 17th centuries, but there were hosts of other painters and no doubt movements, ebullitions, -isms. The essential art is what is finally and permanently distilled.

So it is, too, with modern art. That which seems so important to the inventors of and participators in, new movements may be forgotten possibly as quickly as the movements have arisen. (*See* POST-IMPRESSIONISM.)

Fauvism.—The first definite revolt against Impressionism was made in 1906 when a number of artists, who were tired of the prevailing influence, revolted against discipline of any sort. They were called, once again in derision, *Les Fauves.* There was no special technique which distinguished the movement. They revolted from what they considered the limitations of Neo-Impressionism. The movement was merely a restatement of the universal demand for "Free Speech." The leaders of the movement were Matisse, Braque, Van Dongen, Vlaminck, Dufy and Friesz. They reacted not merely against Impressionism but against academic and all other rules of art.

Instead of the conception of art as nature seen through a temperament, they wished to substitute a temperament which no longer served nature. It was a revolt against naturalism in art, which they regarded as no better than an inventory of natural effects. They pretended to choose from Delacroix's *dictionnaire de la nature* only what would help them to the production of works of constructive art which would add to the conquests of the Old Masters, aesthetic revelations unknown to those Masters.

In their enthusiasm they studied the works of the Greeks and the Egyptians, of the Byzantine period and even negro art. The passion of modern collectors for negro art dates from that period. Good and bad resulted, for art, being an expression of the artist's personal impression of nature, may or may not be fed by a variety of things. And the attempts to feel things with the emotions of a past age are inevitably still-born.

Naturalism.—Concurrently and opposed, though possibly unconsciously, to Fauvism, there developed the school of Naturalism. One branch, merely sensual and concerned entirely with material things, was described by Adolphe Basler as the "School of the Greasy Dishcloth." The painters were more or less academic. All of them had studied to some extent at the École des Beaux-Arts. Such artists as Bouche, Gromaire, Conrad Kickert, Gritchenko, etc., were members. One group, known as "L'École du Pré-Saint-Gervais" was led by Loutreuil, who died quite young in 1925, after a miserable existence. His companions were the painters Billette, Chotin, Caillard, etc. In dismal and dirty tones they expressed the misery of life.

Cubism.—The most important movement, and one which had considerable vogue for a time, was one which, strictly speaking, had little to do with art. Its conception was either intellectual or pseudo-scientific. It supported the portentous name of Cubism with which it was endowed, it is believed, by Matisse If it was conceived as a *jeu d'esprit,* its inventors had hard work to live up to its cubic reputation, for it was taken quite seriously by certain dealers of the Rue de la Boëtie and by certain collectors who believe what dealers tell them. Seldom has a joke reacted more painfully on its perpetrators. It was supposed to be an attempt to reduce nature to its geometric elements. What became of art as a means of expression or how the personalities of the practitioners survived these geometric dreams is not clear

Picasso himself, who is credited with being its inventor, told the writer that it was a sort of "impressionism of form." He showed him, on one occasion, several paintings which were incomprehensible until Picasso arrived at one which he seemed to recognise as a view from the artist's window in Montmartre. However, the writer was mistaken. It was a symphony in form derived from different objects on various pages of an illustrated catalogue of furniture!

One of the claims made for Cubism was that it made no attempt to imitate or organise nature—in this it was quite successful—another was that it produced works which were complete and beautiful in themselves just as a diamond is intrinsically beautiful and needs no setting or other aid to reveal its quality. The beauty

of the object is said to exist in the eye of the beholder and some eyes are peculiar!

It was an attempt at "objective" art with an ignorance of the contradiction in terms which such a thing involves. Art being an expression of the artist's personal feelings about, or his reaction to, nature, the use of the term "objective" art is merely an expression of ignorance.

The chief members of the conspiracy were, besides Picasso, Georges Braque, Albert Gleizes, Jean Metzinger, Juan Gris, Fernand Léger. They made their début about 1910.

The principles of the movement were, amusingly enough, supposed to derive from the paintings of Cézanne That painter had died in 1906, so that his child, born four years later, was too posthumous for its parentage to be entirely above suspicion

The only artist who has emerged from Cubism and actually derived something from it, is Georges Braque. One does not, of course, count Picasso, to whom Cubism were merely one of many incidents Braque, definitely influenced by Cubism, has evolved an art of design, which is derived from nature, although it takes liberties with its subject, and is harmonious and complete in itself Some years later there was an aftermath in which the mannerisms of Cubism were imitated without any reference to their supposed utility. So there appeared on the market, angular, distorted, outlined paintings by such men as Marcoussis, La Fresnaye, Herbin, Picabia and Filla

Futurism.—In 1911, the art world, scarcely recovered from the birth of Cubism, was compelled to submit to the onslaught of a new movement, originating this time from Italy. It was known as Futurism, chiefly because the impressions of the immediate past were involved in its productions Its conception was mainly due to the exuberance of the hysterical poet F. T. Marinetti, who had issued his first manifesto at Turin in 1910 He organised an exhibition in 1911 of a group which consisted of Umberto Boccioni, Carlo Carra, Giacomo Balla, Luigi Russolo and Gino Severini It was, according to its creator, a species of plastic dynamics, but it was nothing more than instinct become self-conscious It reviled and repudiated old and petrified art.

"The simultaneousness of states of the soul at a given moment (that is, the moment of producing a picture) is the basis and end of our art"

In painting, for example, a person on a balcony, the Futurist painted not only the scene actually before him, but the feelings engendered in him by the happenings in the street and also the emotions left in his mind by the happenings of the night before Obviously such an art, founded on confusion, had in itself the germs of the ridiculous

It had a brief and laughter-provoking career, its entrance almost synchronising with its exit Although its origin was really Italian (it had something full-blooded and lacking in reason, foreign to the French nature) it made its début on the Parisian stage before coming to London, where it made a bright and brief appearance at the Sackville Gallery and where an entertaining dinner was given to Signor Marinetti.

Symbolists, Synthesists and Eclecticists.—After Futurism a group of artists of already proved ability were associated in a movement which has been called Symbolism, Synthesism and Eclecticism Their aim was to fuse naturalism with the idealistic tradition of the museum, that is, to serve up realism in a classical form, to see contemporary life through the eyes of the past. It involved discipline and imitation and was, in effect, realism limited by pastiche The idea attracted many artists, some of whom have developed some definitely personal style from it, such as Gauguin and André Derain Other artists of renown who followed the movement were Maurice Denis, Emil Besnard, Odilon Redon, K X Roussel, Felix Valloton Many younger artists were attracted and, naturally, individual preferences among the classical painters were followed Favory followed Rubens, Alix and Georg were inspired by Daumier, Friesz was haunted by his remembrance of Poussin and Delacroix

Modigliani, a charming artist who died young, painted figures in strange and frequently distorted poses Dufy, Dufrenoy, Frelaut, etc., had their preferences.

Intimistes.—The Intimistes formed a small group but hardly a movement. They chose simpler subjects of ordinary life and painted them, as it were, for their own sake. They included Charles Cottet, painter of the life of Breton fisher folk; J. E. Blanche, an intimate portrait and genre painter; Le Sidaner, painter of scenes of village and town life, mostly under artificial light, Prinet, who painted incidents of home life, and also René Ménard, Ernest Laurent and others

Orphists.—Orphism, or abstract painting, in which the painters sought to paint without subject, expired for lack of interest.

Purists.—Purism derived from Cubism or was, perhaps, a protest against the later abuse of it The leaders were Ozenfant and Jeannert; they were followed by Peri, Servranck and Bauermeister. Their principles were the purification of the plastic language and the selection of forms and colours for the creation of a key-board of expression, which should be necessary and sufficient, combining economy with intensity They sought to determine the ideas and sentiments naturally associated with forms and colours. They produced arabesques which expressed, in simple terms, the natural forms of objects without denaturalising them In this respect, Purism departed from Cubism which held itself free to distort or to discard nature if and when it suited its purpose to do so. Purism created an object within a picture, while Cubism created a picture which was a complete object in itself. It sought to make a distinction between painting that pleases and painting that moves and certainly the paintings produced in its name, lack any kind of charm

The lyricism which may be produced by an association of mere shapes, with limited attraction of colour, such as the "purists" produced is inevitably limited in its appeal The attempt to find a close analogy in expression between painting and music, is really an unnecessary confusion In Purism the colours were rigorously designed—a certain form of red, for example, was held to correspond exactly in its use with the *la* in the diapason in music

Certain colours were considered to be exciting and dynamic—such as the pure colours of the spectrum; others were constructive and human (natural earth colours, for example), etc But a picture composed of colours having their special properties was ineffective unless the spectator was already enlightened as to their purposes It became a mere code which was meaningless except, perhaps, to those who possessed the key

Dadaism.—In time of such artistic unrest, one movement followed another, without producing any enduring satisfaction Dadaism was born in 1920 A certain Spanish painter Joan Miro, who later became the head of the Surrealist school, was the inventor of this diversion It was a noisy and amusing demonstration which had a momentary success owing to the fact that it was well organised and extensively advertised It produced a lively revue "391" and a ballet by Picabia, called "Relache," which was produced by Rolf de Maré and danced by Jean Borlin It had no definite technique and no principles and left nothing but the memory of a few charming and spirited compositions With Miro and Picabia were associated Marcel Duchamp, Jean Crotti and Ribemont-Dessaignes

Surrealists.—The next movement, if it may be dignified by such a name, originated among certain writers, who had been affected by the picturesque confusion of the Dadaists They indulged in all sorts of romantic and ridiculous extravagance They called themselves the Surrealists They were a product of the time of unrest following the World War and it had been predicted that the movement would come to an end with the settlement of affairs They were reinforced by a section of painters who were influenced by the romantic movement, having its origin in Germany, known as Expressionism Technically they imitated Braque, Picabia and Picasso, although they were opposed to Cubism and attempted to substitute for its objective conception one which was entirely subjective.

In their productions, technique counted for very little The Surrealist doctrine, derived from Freudism, believed in the expression of thought without the control of reason and sought to paint dreams and states of mind by any means whatsoever Its

followers sought to suggest the mystery of the subconsciousness by translating ordinary objects into strange, horrible or sentimental forms.

A number of painters, Pierre Roy, Viollier, Masson, Malkine, etc., of varied abilities, combined under the leadership of Joan Miro, who declared *Je veux assassiner la peinture,* an elegant ambition which he may or may not have achieved, and at one time Giorgio de Chirico, a painter of rather more ability, came under their influence.

"Popular" Painters.—A symptom of the times—of the rise of democracy—was the interest shown in the work of certain untrained painters of humble rank, who were engaged in other occupations. These painters were not associated and cannot be said to have formed a movement, yet they have had considerable influence particularly on some of the younger painters in England, who have deliberately cultivated a school of self-conscious naïvété.

This outbreak of painting among the lower classes, which was called in France *l'art populaire* has been fostered by the facilities for art study and by the exploitation of such painters by dealers. It has developed during the last twenty years following the success of the *douanier* Rousseau, whose canvases were the remarkable and unaffected expressions of a childlike vision. Following Rousseau, who was the first and most important of the "popular" painters, came André Bauchant, a farmer in Touraine, whose work with all its naïvété is curiously reminiscent of the museums. His subjects are drawn from history and not from the daily life of his environment. He held his first exhibition in 1921 and was elected a member of the Salon d'Automne—an instance of the new liberal-mindedness of such institutions.

The early work of Utrillo—landscapes in the Parisian suburbs—painted with a direct and untutored naturalness might come under this category. Utrillo was the son of Suzanne Valadon, who had been an acrobat and had posed for Puvis de Chavannes and Renoir before taking up painting herself. Her own work was "popular" in feeling, although there is some trace of sophistication in it, due to the fact that she had seen so many paintings and known so many artists.

Other painters of *l'art populaire* are Bombois, a navvy, who only recently felt the desire to paint. Like all primitive painters he excels in painting lights and reflections. His work has a certain purity of style that is certainly innate. Emile Boyer is a seller of fried potatoes. Unlike most "popular" painters, he dislikes anecdotal subjects. Le Gay, the *agent* and Emile Gody, the chimney sweeper, are other painters of the same class. Their work has a sincerity, a directness and freshness of vision and often a power of invention which gives it a value sometimes greater than that of the followers of the pretentious movements which have been described.

Current Painting and Painters.—As might be expected in the turmoil following all the movements which have agitated French art in the 20th century, the work of the younger artists is confused and uncertain. Their aims are varied. There is no school or movement. Cubism, which perhaps had in it some germs capable of development, is too recent either to be considered judiciously or to give birth to a genuine reaction.

The sane belief that each artist should seek the means of his own personal expression, contains within it an element of doubt—a fear that something is being missed. The tendency is towards forming groups or movements which actually more often than not act as a deterrent to free expression, committing the painter to certain doctrines and methods which do not truly represent his personality.

It is a period of transition. The lessons of the discoveries, reiterations, follies and suggestions of the immediate past are in process of being digested or repudiated. The main force inspiring the young is still Çézanne, but he has yet to be really understood, the majority of the younger painters still being in the stage of imitation or misinterpretation.

So we have a number of young painters, of varying degrees and ability, groping for expression. Perhaps the note which is common to all their work is a certain Romanticism which has, perhaps naturally, been evident since the World War. R. T. Bosshard (b. 1889), a painter of nudes, is an eclectic combining various influences going back to Courbet and not without some trace of futurism. André Beaudin (1895–) is a decorative painter who might be described as a symbolist, who seems to derive from Odilon Redon and the Chinese, but who is still seeking a completely free means of expression. Jean-Francis-Laglenne (1898–) is an interesting artist who owes much to Vuillard and something to Braque and Matisse; Auguste Mambour (born at Liège in 1896–) whose nudes have weight and volume and sometimes an aggressive solidity, represents a classical strain developed through Cubism. Menkès expresses a kind of mysticism modified by Cubism. In the work of Roland Oudot (born about 1898) one sees the ideas of Renoir inoculated with the modern ideas of volume and, in his figure paintings, a remote echo of Le Nain. Térechkovitch, born at Moscow in 1902, an imitator of Van Gogh; Pascin, born in Bulgaria in 1885, of Spanish and Italian parents; Suzanne Roger (born about 1899); Soutine, with a fondness for subjects of the kitchen and the butcher's shop; Halicka, (1894–), whose work shows conflicting aims; Moïse Kisling (1891–) influenced chiefly by Picasso and Modigliani, are the most promising of the younger artists.

So rapidly have events moved that the painters of yesterday, who were regarded as innovators, have become old-fashioned to-day.

Dunoyer de Segonzac is now sober and solid if a little dismal. André Derain, influenced by the Cubists, is found to be somewhat Spanish in the sobriety of his still-life paintings and somewhat classical in his solid stylistic landscapes with their limited range of colours. Marquet, another stylist, founded on Matisse, is noted for the economy of his means and his restraint; Dufresne is a romanticist and an interesting painter who has gathered much from many sources. Raoul Dufy is a pattern maker, with a calligraphic style, and a frank imitator of Matisse. Vlaminck's work, often violent and crude in his landscapes, has developed something of the qualities associated with pavement artists. Van Dongen disguises the mediocrity of his mind under a certain flamboyant extravagance. All these artists are now well-known and accepted, and it has become extremely difficult to be revolutionary.

Although it is natural that strange movements by their novelty and violence should attract most attention, the current of art moves on inevitably and certain painters of established reputations have pursued their paths unperturbed though, perhaps, not entirely uninfluenced, by the ebullitions of the more youthful elements.

Such painters as Bonnard and Vuillard, derived originally from Degas and the Impressionists, produce works of an intimate beauty Aman Jean, the gentle sentimentalist, with his refined and delicate colour; Lucien Simon, with his appreciation of native character and a fluent and vivid style, are still painting. Prinet, a Degas without poetry, Milcendeau, Desvallières, with his confused symbolism; Pierre Laurens; Odilon, with his exquisite flower pieces and mystical paintings; Maurice Denis, the symbolist; K. X. Roussel, with his charming lyrical spirit; Lebasque, the warm colourist of the South; Charles Guérin, Jean Puy and Flandrain are the best of what may be called the older school of painters.

Matisse, who started as a realist of a more or less academic kind and has developed a simple crystalline form of expression with the strictest economy of means, has shared with Cézanne the honour of having the most vital influence on the younger school.

MODERN DEVELOPMENT IN ENGLAND

In English art, although it was influenced by France and, later, by the general state of affairs, the agitation was less extreme. Compared with the placidity of the 19th century, when the Pre-Raphaelite movement seemed a desperate revolution, the time would have appeared full of turmoil. The Royal Academy pursued its dull path without excitement and without change. The brilliant if superficial cleverness of J. S. Sargent had a certain influence but not a salutary one. The New English Art Club, founded by W. J. Laidlay in 1886, offered an opposition to the Academy and provided a place of exhibition and a point of con-

centration for the more independent and younger painters. The main influence, at the time, was that of French Impressionism although it was neither strong nor extensive in England.

Some years later, about 1910, a number of painters combined to form a centre and meeting place for painters of a more modern tendency, and their friends. They held weekly exhibitions at a studio at 19 Fitzroy St., London. The chief promoters were Walter Sickert and Spencer Gore. Lucien Pissarro joined them later and Augustus John was a member at one time. Other members included Gilman, Ginner, Manson, Bayes, Drummond. The influence of the group, although not immediately apparent, led to other things. Lucien Pissarro brought from France a new influence, that of French Impressionism, which, previously, had had little effect on English art. Walter Sickert, now known as Richard Walter Sickert, one of the most genuine and most personal of modern artists, had practised a form of Impressionism (not strictly based on colour values) which was nearly akin to that of Degas and related to that of his artistic French cousins Bonnard and Vuillard, who, however, were looser, both in perception and handling, and more inclined towards a lyrical expression of colour. And P. Wilson Steer, one of the leading artists of the New English School had exploited French Impressionism in the 1890's to abandon it, soon after, for the native English form which derives from Constable and Turner.

The fine exhibition of the French Impressionists held at the Grafton Galleries in 1905, which contained splendid examples of all the masters of the school and included pictures such as "La Loge" by Renoir, Manet's "Eva Gonzales," "Wandering Musicians," etc., Degas' "Carriage at the Races," which have since become world-famous, attracted attention but had little influence.

In 1911, the members of the Fitzroy Street Group, desiring to obtain wider publicity for their work, formed the Camden Town Group, with Spencer Gore as president. The desire to enlarge the group, in order to include other and more modern phases of art, led to the formation, in 1913, of the London Group and its first exhibition at the Goupil Gallery in 1914. The Group has now considerably increased in size and influence and includes in its membership the more prominent of the "advanced painters."

A remarkable exhibition, which had an immediate and definite influence on the younger English painters, was the Post-Impressionist Exhibition held at the Grafton Galleries from November 1910 to January 1911. Many artists, who have since been recognized as masters, were introduced to the majority of English painters for the first time Cézanne, Gauguin, Picasso, Van Gogh, Matisse were remarkably well represented and Manet, more familiar, was seen in many phases of his development. His pictures included the famous "Bar aux Folies Bergères," now in Mr. Courtauld's private collection.

The influence of the exhibition was seen mainly through Roger Fry and the small group who followed and supported him: Duncan Grant, Vanessa Bell, Keith Baynes, Clive Bell (writer), etc. The effect was a little too immediate to be entirely logical or convincing.

The painters began to talk of their "reactions." They became self-conscious about the matter. That which should have worked sub-consciously was dragged into the full consciousness of reason and the "reaction" was sometimes, in consequence, of doubtful genuineness and led to the suspicion that it was made to suit the school, so remarkable was the resemblance, at least at first, between the works of the different artists. Solidity was aimed at, rhythm was cultivated and, curiously enough, only so-called ugly things provided "reactions" on the group. Colour as an essential means of expression disappeared.

The work developed, the artists gradually becoming more individual. They were later combined, with the addition of F. J. Porter, Bernard Adeney, etc., forming the London Artists' Association. This was a scheme by which certain collectors guaranteed the artists a certain income based upon the probability of their sales.

Too Much Encouragement for Young Artists.—The time is notable for certain things whose effect on art, *per se*, is problematical. There is a remarkable increase in the facilities for exhibition, the increase of small art galleries, the support given to young and often quite untrained painters. It is often a case of fools rushing in. In former times a painter had to be qualified to some extent before he could hope to exhibit. Now it is a question of competition to secure something new and naïve that can be exploited before it is proved to be utterly worthless. But there is no one employed who is capable of deciding who is worthy of help and the young student is taken from the cradle and "helped" by the Contemporary Art Society, by funds and by well-meaning, but quite ignorant, collectors. And the young student, before he has mastered the rudiments of his art, before he has had any experience, before he has had time even to digest the elementary principles which his master has tried to implant in him, is taken up, fed on the fruits of success and poisoned by his own choked-up artistic "lazy colon." A virtue is actually made by a certain small number of artistic "snobs" of collecting the works of the so-called "naïve" school—a contradiction in terms; a confirmation in folly.

Post-Impressionism, one of the vaguest terms ever used in the strange jargon of art critics, covered a multitude of incompetence. It operated mainly in one direction and that, strangely enough, was supposed to receive its impetus from Cézanne. Cézanne was an exquisite colourist; the quality which his so-called followers neither perceived nor felt, was colour. Cubism influenced two painters worth mentioning: Wyndham Lewis and W. Roberts. The former, with his brilliant cleverness, exploited a bastard version of Cubism until it ceased to amuse him; the latter developed a system of angular construction which, though nothing to do with Cubism in essence, was amusing for a time. That sort of thing meant a small gain and a real loss—a gain of pattern and, perhaps, of strength; a loss of mystery, poetry and truth.

The philanthropic impulse towards young artists, characteristic of the age, is very dangerous. It seems that a young painter receives a reward without having earned it and without having proved his worthiness for it. It stultifies development. It has been fostered by the most prominent art masters of the period through a spirit of philanthropy and the desire to make use of what funds are available.

Mural Painting.—Another modern development, and one worthy of encouragement, is the increasing demand for mural decoration In 1912, a movement, fostered by Charles Aitken, director of the National Gallery, Millbank, resulted in an exhibition of designs for mural decoration; many of them sent in for competition. A certain number of mural paintings had been executed before this exhibition; notably those in the Chelsea Town Hall under the direction of J. S. Sargent and Charles Sims; and others of a more modern tendency by Duncan Grant, Etchells and A. Rutherston working under Roger Fry at the Borough Polytechnic. The exhibition bore little immediate fruit, but in 1928 and previous years there have been many instances of artists, particularly young artists, being employed for the mural decoration of buildings.

The chief of these were the decorations in the Refreshment Room at the Tate Gallery by Rex Whistler; the Refreshment Room at Morley College by Royal College of Art Students under Prof. W. Rothenstein; the Peel Institute by Prof. Tonks's students; lunettes for the L.C.C. Hall by the pupils of Walter Bayes, etc.

Schools.—In regard to the teaching of art, the Royal Academy's methods have from time to time been the subject of much adverse criticism, principally on account of the "academic" outlook of its art standards. Despite its remarkable effort in electing Augustus John and Richard Walter Sickert to its ranks, it has not changed its methods or its qualities; for two swallows could not make an artistic renaissance in Burlington House.

The best schools were the Slade, the Royal College of Art and the Westminster School of Art. At the former, Professor Henry Tonks succeeded Professor Fred Brown. The tradition of teaching the students at this school to draw like old masters was uniformly carried on. The teaching of Professor W. Rothenstein at the Royal College has been most fruitful, while at the Westminster Sickert carried on a tradition which was essentially artistic,

teaching a student to find his inspiration in real life and giving him a flexible means of expressing his perception. Sickert was succeeded by Walter Bayes, a sound constructor of pictures, in whose teaching scientific means predominated over emotional perception.

An event of artistic importance was the opening, in 1926, of a wing for Modern Foreign Art at the Tate Gallery.

Current Painting.—In London, as in Paris, the younger painters are undecided. The two main influences are Matisse and the *douanier* Rousseau. The latter is the more popular as being easier. After all, he was untrained, and had a great posthumous success. The former influence is fatal. The victims of it endeavour to imitate the end without having known even the beginning. Two young painters, Ben and Winifred Nicholson, attempted to combine both influences. Only one painter, C. R. W. Nevinson, attempted to imitate the Italian Futurists, after their exhibition in 1912. He had a brief success and became a realist, of uncertain quality, more or less after the Central Continental pattern. Two other painters who have had success in the dawn of the Post-Impressionist movement were John and Paul Nash—particularly the latter. Although he is sometimes an artist within a strictly limited range, he is more often an illustration of the limitations of this method—which is its tendency to substitute ingenuity for art.

As is the case in Paris and elsewhere, the main stream of art flows on almost undisturbed by the agitations which make copy for journalists and so agitate the desires of the collector. The few undoubted and accepted artists of the time pursue their own line of development. Richard Walter Sickert, Lucien Pissarro, P. Wilson Steer, Ambrose McEvoy and Augustus John are names on which the historian can rest with some degree of certainty. Although the French influence has been a predominating factor in modern English art, it has been proved that English art is at its best when it is purely English.

MODERN PAINTING IN GERMANY

The Germans are an intellectual, philosophical and musical people. But their artists (painters and sculptors) have been few. Curiously enough, they have always taken an interest in French art and long before French Impressionism had dawned on England, the German collectors had been acquiring masterpieces of that school of painting. They have had two good first rate painters: Adolf Menzel and Max Liebermann. But they have always been extremely active in following French development and have attempted to originate movements of their own.

In 1900 the predominating influence on German painting was the newly founded "Berliner Sezession." It was organized by Max Liebermann and Paul Cassirer, the prominent art dealer. The main interests of their exhibitions from 1900 to 1908 were provided by the paintings of Manet, Monet, Degas, Renoir and Liebermann. Their influence caused the formation of the German Impressionists under Louis Corinth and Max Slevogt.

Coincidentally with the developments in Paris there arose in 1908 a movement which sought to abolish Impressionism, both French and German. The leaders of the new movement were Oscar Kokoschka of Vienna and Max Pechstein of Berlin. They were stimulated, if not directly influenced, by the paintings of Van Gogh, Gauguin and Matisse. Another influence came from Russia from such painters as Javlensky, who became known in Berlin at the time.

Expressionism.—The movement was called "Expressionism" in contradiction to "Impressionism." The Expressionists, then unaware of Cubism, painted in crude colours and in an exaggerated manner. They united with an association known as "Brücke" (Bridge): Otto Heckel, Eugen Kirchner, Schmidt-Rottluff, Otto Müller and Emil Nolde. Various sub-groups were formed; one of them called "Sturm" (Tempest), under the leadership of the writer Herwarth Walden, pushed matters to such extremes that the movement became grotesque.

About 1910, Picasso and the Cubists made their appearance in Germany. A new Sezession was formed in the Rhineland, known as "Sonderbund" (Special League). They exhibited Picasso and other Cubist painters. But Cubism had little success in Germany and few—the chief of whom is Lyonel Feininger—still practise it. The influence of Futurism was as short-lived in Germany as in France and England.

Expressionism survived but in modified forms; it took on an academic complexion with Weisgerber of Munich; a semi-cubist manner, with Franz Marc, also of Munich; Renoir's and Matisse's influence was noticeable on August Macke of Düsseldorf. All three painters were victims of the war.

The most active of the later followers of Expressionism were Kandinsky, a Russian naturalised in Germany, who practised a kind of abstract painting, consisting of lines and patches of beautiful colour, Paul Klee, Heindrich Nauen and Campendonck.

After the war an attempt was made to introduce a new movement, "Neue Sachlichkeit," corresponding with the French "Surréalism," which marked a return to naturalistic forms, not in an impressionistic but in a naïve-realistic manner. The movement received some impulse from the work of the *douanier* Henri Rousseau. This new realism attracted some gifted painters and is still in force to-day. Its chief representative is Otto Dix.

MODERN PAINTING IN U.S.A.

North America.—The art of North America has submitted in turn to many influences. At first, in the 18th and early 19th centuries, the influence came from England and some of the leading painters, such as West, Copley, Gilbert Stuart, actually took up residence in England and played prominent parts in the art there. Others, like Matthew Pratt, Trumbull, Vanderlyn, remained in the U.S. and practised sound tradition with success.

As the younger painters migrated to Europe for the purposes of study, the centre of influence was shifted; at first, in the 1850's, to Düsseldorf, Munich and Antwerp, where such painters as Eastman Johnson, Dielman, Chase, Duveneck worked. The last named had a school in Munich, with J. W. Alexander, Vinton, De Camp, etc., as his pupils. The influence of the French Barbizon School then began to be felt in the work of W. M. Hunt, George Innes and La Farge. This was succeeded by the potent influence of French Impressionism which has had beneficial effect on the work of Alex. Harrison, Benson, Alder Weir and particularly Childe Hassam.

The establishment of the Society of American Artists in 1877 with La Farge as President did much to organize and strengthen American Art.

This brief review of 19th century art in the U.S. shows that American artists have always received educational stimulus from Europe. The same is true to-day, but the influence is now derived almost exclusively from Paris. In spite of the claim of many American writers, there is no art that can be acclaimed as definitely and peculiarly American. The American stock in art is fundamentally academic and it is particularly susceptible to European influence.

Three or four names are especially prominent in American art, but they, strictly speaking, belong to the late 19th century both in theory and in practice. North America's greatest practitioner, Winslow Homer (1836–1910) was influenced mainly by Courbet. He was a strong realist. Certain distinguished artists, Whistler, Sargent, Abbey, Mary Cassatt, although American in origin, have been claimed by other schools. The first was a law unto himself and might have been claimed, with equal justification, by Japan or Paris. Sargent was Carolus Duran raised to the nth power, Abbey was academic and Mary Cassatt, a delightful artist, belonged to and was the product of the French Impressionist School.

The main influence on American art of the present day is that of the so-called followers of Cézanne. That is, on the younger painters, like Samuel Halpert. There is in America, as in all other countries, a strong and steady current of art which is not definitely influenced by modern events, but which is really the main stream into which modern tributaries flow, changing its character almost imperceptibly. W. M. Chase (1849–1916), a sort of Sargent without Sargent's peculiar snap, but with a certain added reticence, and J. W. Alexander (1856–1915), a charmingly decorative portrait painter, are in no sense innovators but belong unobtrusively to the main stream. There are many other art-

ists who have attained varying degrees of fame without definitely influencing present-day art. Frank Duveneck (1848–1919), who studied in Munich, is known as a follower of Whistler. J. R. de Camp (1858–1923), who followed after; A. H. Thayer (1849–1921), whose influence was German *cum* Italian 17th century with a religious tendency; G. de Forest Brush (1855–), the portrait painter with an interest in Indian subjects; Kenyon Cox (1856–1919), a decorative painter not uninfluenced by J. F. Millet; Howard Pyle (1853–1911), a strong illustrator, all belong to the 19th century so far as their art is concerned Other names, which are more or less well-known, are Gari Melchers (1860–), who was nursed in Germany and Holland; Cecilia Beaux (1863–), whose portraits are popular; C. D Gibson (1867–) who began and ended as an illustrator; Albert Sterner (1871–1918), a charming illustrator; J. F Folinsbee (1892–), a good painter of running water in the manner of Thaulow. Among the younger painters one finds the essential American academicism, superficially influenced by the doctrine of so-called Post-Impressionism and, one may note that American writers appear to attach a special meaning to that vague term. George B Luks (1867–) is a painter with a solemn air. Although he was educated at Pennsylvania Academy, and in Paris, Düsseldorf and London, he now professes to scorn all academic training. It is claimed that he paints "in the way Whitman wrote." E. L. Blumenschein (1874–) seeks to emulate Gauguin; A. B. Davies (1862–) practises a sort of academic and somewhat remote imitation of Puvis de Chavannes; G W Bellows (1882–1925) is strongly realistic; the work of Rockwell Kent (1882–) is reminiscent of Cameron, with an added crudity which passes as strength, Samuel Halpert, a follower of Cézanne and Derain, is one of the most promising of the younger school.

According to at least one American writer, there is a school of "Virile Impressionism," but its tenets or its peculiarities are not apparent. This writer says that "Matisse is moved by a spirit fundamentally different from that which animates Davies, Arthur, Jerome and Eddy" Kroll, one of the leading members of the school, is a striking example of the prevailing idea of Impressionism There are many facilities in America for the popularisation of art. The art galleries are well built and admirably organised. The art schools are perhaps the most up-to-date in the world. Art and artists have every opportunity

PROGRESS IN EUROPEAN COUNTRIES

Belgium.—Belgium, being a near neighbour of France, has naturally been susceptible to the influence of the various movements in Paris There was the definite influence of Impressionism on such painters as Emile Claus, A J. Heymans and, to some extent, James Ensor, but, as in France, there was the inevitable reaction against such influence This was expressed at first in the work of a certain group of painters who, before the war, concentrated and worked at Loethem St. Martin, a village in the Valley of the Lys, in the district of Ghent. They gathered round the sculptor George Miune, whose home was in the neighbourhood. The chief members of the group were Valerins de Medelsar, Gustave Van de Woestyne, Constant Permeke, Albert Servaes, Gustave de Smet, Fritz Van der Berghe and Albert Saverys. This group was influenced by the German Expressionism.

The influence of Cézanne, Gauguin and Van Gogh was especially strong, particularly in Brussels and its neighbourhood Rik Wouters, a prominent follower of Cézanne, has become an artist of a very personal quality He, with Auguste Oleffe, exercised considerable influence on the Brussels school, which, after Expressionism, sought a more synthetic art

The chief painters of the Brussels group are Phil Cocks, W Paerels, A. Dekat, C. Dehoy, R. Parent, J Brusselmans and J. Albert. E. Laermans, a Brussels painter, is the leader of the Synthetic School. Several artists of distinction can be said to belong to no definite school. Opromes and Daeye, at Antwerp; Millaert at Ostend, Tylgat at Brussels. Among the painters who may be described as traditional or academic, may be mentioned Delaunois of Louvain, L. Fréderic of Brussels, Rossenfosse of Liége, Franz Heus of Antwerp and Jacob Smits of Moll

Holland.—The Dutch genius is very far remote from that of France. In the whole history of the art of the Netherlands there is no strong evidence of direct French influence The Dutch character leans towards a sort of intimate realism and even in their grandest and most inspiring moments their artists have never forsaken that essential character

The Maris family had a certain following but theirs was a triumph of individuality and personal feeling rather than the exploitation of new ideas or the submission of extraneous forces The subjects made popular by Jacob and Willem Maris were national and homely in character Among the modern painters the most prominent are Jan Toorap, a gifted painter; Monnickendam, an artist whose admiration for Rembrandt is reflected in al his work, even in his still-life subjects which represent a great part of his work Lizzy Ansingh, a gifted painter with a rather unusual phantasy, is influenced by the Russian Ballet if by anything. A group, which practised an abstract form of painting, suggestive of stained glass windows composed exclusively of geometric shapes included Van Doesburg, P Mondrian, Van der Leck, Vilmos Huszar and Van Tongerloo

Scandinavia.—Among the northern nations, the influence of Munich has been stronger than that of Paris Both in Norway and Sweden the prevailing character is that of a vigorous and personal realism In painting, Sweden has probably been more active than Norway, although the latter country has had some notable painters who have not risen, however, above a certain respectable level Edvard Munch is probably the greatest of their painters He has been influenced by both Matisse and Marquet, particularly the former Dagfin Werenskiold, a painter of character, whose "Peasant Family" was shown in London at the Norwegian Exhibition in 1928, would appear to be influenced by Van Gogh, although his strong and personal work is the result of a direct and uncompromising perception. The landscapes of Harold Sohlberg and Henrik Sorensen are notable; those of the former being lyrical and reflective, while the latter's show a rugged sincerity. Per Krogh, who is considered to be one of the most modern in technique, displays a certain vulgarity which is certainly more German than French. He executed decorative panels for the Grand Hotel Restaurant in Oslo

It was in the early 'eighties that Swedish artists became really active They had then become acquainted with the work of the French Impressionists and had learnt something of the value of the new vision and a closer and more direct approach to nature

The results were seen at the "Opponents" Exhibition in Stockholm in 1885. The exhibition was greeted with the derision accorded to all new movements, but many of the exhibitors united to form the "Konstnarsforbundet" in 1886, which marked the definite foundation of the modern Swedish School. The prevailing influence of Dusseldorf had been succeeded by that of Munich and finally by that of France, but the new artists determined to throw off all foreign influence, which was a healthy if an impossible attitude. One of the leaders of the new movement was Ernst Josephson (1851–1906) He was supported by the more widely known painter, Anders Zorn (1860–1920), whose brilliant gifts of execution almost rivalled those of J S. Sargent Zorn however, was a superficial observer who sacrificed everything, both in painting and etching, to brilliant personal technique His influence, like that of all painters whose work is merely the exercise of personal cleverness, was not a salutary one nor capable of development His immediate followers were Larsson (1853–1919 and Liljefons Carl Hill (1849–1911) was the chief of those influenced by Impressionism

August Hagborg (1852–1921) and Hugo Salmson (1843–1894 were prominent members of the "Opponents" group; like Pe Ekström (1844), they lived and worked in France George Paul (1855) practised fresco painting, using that medium for the decoration of the staircase in the Gothenburg Museum. He was affected by most of the modern French movements and finally adopted a cubist manner. Hanna Pauli (1846–), figure and portrait painter; Acke (1859–), marine and genre painter Oscar Björck (1860–); Richard Berg (1858–) are other well-known names in Swedish art K Nordstrom (1855–), .

prominent leader of the "Konstnärsforbundet," Wilhelmson (1866) and Hesselborn played a part in the movement which led to the formation of the national school of painting.

The movements known as Expressionism (from Germany) and Cubism (from France) had a certain number of followers in Sweden, of which the more prominent were Isaac Grünewald (1889), Gösta Sandels (1887–1919), Leander Engström (1886).

Finland.—The chief influence in Finland came from Sweden, of which country Finland formed a part until its conquest by Russia in 1808. The influence was general and not confined to art. The people are distinguished by a natural love of colour which was expressed in their richly coloured rugs and the naïve paintings which covered the walls of country churches. But there was little serious art previous to the 19th century.

There were no art patrons and few facilities for the study of painting. The modern school, such as it is, dates from the foundation of the Finnish Art Union, which provided funds to establish a school of art. It is not advanced in character but resembles the more academic side of Swedish art. The chief painters are B. Lindholm (1841–1914), A. Edelfelt (1854–1905), V. Westerholm (1860–1919), who was trained at Düsseldorf and afterwards followed the French "plein air" school, Hélène Schjerfbeck (1862), M. Enckell (1870–1925), Hugo Sunberg (1873–1917), a strange personality, somewhat akin to William Blake, and Marcus Collin (1882) of Swedish origin, who follows Expressionism.

Russia.—Russian art, in spite of the impact of modern movements, has maintained its national characteristic quality, a sort of direct, almost primitive, realism.

More or less superficially it has been affected by contact with Paris for most of the Russian artists have found their way there. But the process of modernisation which has been felt, in varying degrees, in all countries, has been less drastic, has operated in a less imitative way in Russia.

Many Russian artists have been attracted by the theatre and the ballet; in the designing of costumes and in *décor* they have been peculiarly successful. Among the artists who have given the best of their attention to this branch of art, Leon Bakst (died in 1924), Alexandre Benois, Ivan Bilibine, Mstislav and Rostislav, Dobuzinski, Golovine and Koustodiev are the most notable. In spite of an intermittent tendency to the fantastic (which is yet rooted to earth), such as one sees in the paintings of Chagall, the majority of the painters are realists. Certain artists have a religious preoccupation, such as Stelletzki. The chief realists are Gregor Chiltian, whose work is almost photographic in its directness, Boris Grigorieff, Jacovlev, Nathalie Gontcharova (Spanish subjects), Gritchenko, Schoukhaeff, Zenaïde Serebriakova, Polunin, Nadia Benois.

Italy.—The southern countries were but little affected by the modern activities of Paris. In Italy, the almost isolated outbreak of Futurism, under the poet F. T. Marinetti, was speedily transferred to the more fruitful soil of Paris and appears to have had little influence in the country of its origin. The standard of modern Italian art is not a very high one, but there is a good average of production, mostly academic in character.

The main characteristic of the latter part of the 19th century was a sort of picturesque Courbet-ism with an occasional flavour of Fantin-Latour and even of Proud'hon. Monticelli was also a potent influence. This was succeeded by the influence, particularly in the northern districts, of the fine painter Segantini, who died in 1899. In the work of certain painters, Luigi Galli, for example, the influence of the Old Masters, particularly Michelangelo, is strongly felt.

On the work of very many of the portrait painters the pernicious influence of Carolus-Duran has left its mark.

A description of modern Italian art consists, almost inevitably, of a list of names, as there appear to be no definitely marked schools of painting or movements.

Antonio Mancini (born in Rome 1852), the portrait and figure painter, is strongly individualistic, not to say vulgar, in his methods. In his later work, in which the paint is extraordinarily thick in parts, he has used various means to produce an effect, even employing pieces of glass, bits of tin, buttons, paper, etc.—a device which he used before the Futurists employed it. His earlier work, in a broad academic manner, is fine in character and drawing. Gaetano Previati (1852–1920) was superficially influenced by Segantini, but lacks the subtle colour analysis of that master; the same influence is perceptible in the work of Mario Puccini (1869–1920); Eugenio Prati (1842–1907), who is thought highly of, was influenced in his later work by Monticelli; and Emilio Gola (1852–1923) was a sort of Sorolla (the Spanish painter), with a warm academic quality and some reference to Monticelli. Arthur Rietti combined the quality, very much removed, of Menzel and Degas. The Venetians, Frederico Zandomeneghi (1841–1917), akin to Besnard plus a certain austerity, and Guglielmo Ciardi (1843–1917) showed an admiration for the early Corot, while Pietro Fragiacomo (1856–1922) painted night effects on the Lagoons with a rare subtlety.

Angelo Morbelli (1853–1919) practised a kind of up-to-date decorative symbolism. Other notable painters were Bartolommeo Bezzi (1851–1923), Cesare Tallone (1853–1919), Mario de Maria (1852–1924), Michele Cammargno (1835–1920), Antonio Leto (1844–1913) and E. Delbono (1844–1915).

Czechoslovakia.—About 1900 there was an outcry on the part of certain of the Czech artists against the "free tendencies" of French art, which were considered to be a menace to the national productions, such as they were. But French art prevailed and in 1902 a pavilion was built for an exhibition of Rodin's work. This was followed by an exhibition of paintings by Manet, Degas, Renoir, Sisley, Carrière, etc., and in 1908 at Prague, of Daumier, Pissarro, Monrisot, Bonnard, Vuillard and of Cézanne, Gauguin and Van Gogh. The influence, therefore, was mainly French, but early in the century some of the younger painters discarded Impressionism in favour of Cézannism. They formed a small society of "Eight," which led to a quarrel with the Mánes Society and a subsequent reunion. This society was named after Joseph Mánes (1848–1891), who had substituted the direct study of nature for the idealism of Cornelius and Overbeck.

Antonin Slaviček became known as the Master of Czech Impressionism; with him were A. Hudiček, Oldřich, Blažiček, Otokar Nejedly and Průcha.

Jan Preisler was one of the founders of the Mánes Society and Max Svabinsky was an active member. Karel Myslbek was influenced by the Spanish painter Zuloaga. F. Simon, Spillar, Boetlinger were all definitely French in feeling. Nechleba, Obrovsky, Mayer were notable names; Emile Filla led the younger painters towards Cubism and Expressionism.

Switzerland.—Swiss painting has not been prominent in any review of art, either for its quality or its quantity; nor has it been ever very distinctive in its blended qualities of Munich and North Italian; but there has been a certain improvement in modern art, particularly in sculpture.

The painter Ferdinand Hodler (1853–1918) was the most notable national figure. His work in landscape, figure, portrait and genre has had remarkable virility and some originality. Others, E. Morgenthaler, R. H. Pellegrini, A. Blanchet (influenced by Gauguin and Derain), C. Amiet (Impressionistic influence), may be mentioned.

Spain.—Spain remains conservative and very little influenced by the art of its neighbour.

Zuloaga, a daringly direct observer, is well-known through exhibitions in Paris and his paintings in the Luxembourg; Sorolla is a virile painter of contemporary life, who might be compared with Sargent; Zubiaurre combines a primitive instinct with the directness of Zuloaga; Solomayer, the realist, has adopted a style somewhat reminiscent of Lucien Simon.

Buenos Aires.—Buenos Aires has become a centre of remarkable artistic activity; the annual Salons there reveal the existence of a large number of painters of a high level of artistic ability.

PAINTINGS, RESTORATION AND PRESERVATION OF. It would be extremely difficult, if not impossible, to determine at what date the restoration of painting was first undertaken.

Ancient restoration does not reveal any technical processes of much interest; no real progress was made in the art of picture restoring until the 19th century. It is true that such men as Le Primatice, J. B. van Loo and even Chardin, were sometimes entrusted with restorations; but it was the exception for them to undertake such work. As a general rule the touching up of damaged pictures was, and unfortunately only too often still is, entrusted to inferior artists who regard the restoration of paintings as an unimportant work.

The result of this has been that during past centuries, no tradition has grown up, and in consequence of the low esteem in which that branch of art has been held, no outstanding personality has devoted his authority and skill to putting an end to this regrettable state of affairs. It must be added that at those periods when the art of painting stood high in popular favour, the most skilful forgers have been found among the restorers of pictures. Such men often had considerable skill in their own way, even though they were without real talent; and a study of the history of painting frequently shows that unscrupulous restorers have made use of their knowledge in order to make alterations or additions to pictures for purposes which certainly had nothing to do with art.

We may leave on one side the undesirable activities of bad workmen, and turn to the development of the art of restoring pictures which has now been brought about by experts.

Elements of Pictures.—The restoration of pastels and drawings would need for its adequate description an essay to itself. In engravings the paper is of the greatest importance. Stains on the paper will disappear on the sheet being dipped in a series of baths, the composition of which varies according to the practitioner. One of the most efficacious methods is:—(1) Dip engraving in a solution of permanganate ($\frac{5}{1000}$) for several minutes. (2) Wash in clear water. (3) Add to the permanganate solution hyposulphite of soda ($\frac{10}{1000}$). Leave the picture in this solution for ten minutes and add ten drops of hydrochloric acid. (4) When the paper has become white, wash it in water for half an hour and dry the whole between sheets of blotting paper.

The diseases from which paintings may suffer are of various kinds. Their treatment may not be so urgent as that of human ailments, but it is just as difficult and delicate in its own way. It necessarily varies with the different schools, pictures and artists, since the problem of restoration is closely bound up with the whole technique of the picture to be restored.

A picture, no matter at what date it may have been painted, consists from the material point of view of two elements: (1) the supporting structure, which may be wood, canvas, paper, cardboard, a wall, etc.; (2) the paint which is superimposed on the supporting structure, and which constitutes the picture itself.

In addition to these two principal elements there are two other factors which appear to be of a secondary character, but which are nevertheless of great importance. The supporting structure is almost always covered with a layer of fish-glue on which is applied some isolating substance such as plaster, carbonate of lime or white lead. Modern painters, it is true, sometimes paint their pictures directly on the canvas, or on a wood panel; but in the course of centuries it has always been found better and more convenient to cover the supporting structure with some isolating substance before beginning to paint. This substance is an element of such importance from the point of view of the restorer that it must be considered separately.

Finally, the fourth element which constitutes the picture is the final varnish, which is in some cases replaced by a thin coating of encaustic.

It will be seen from the above what the vulnerable points of a picture are. At the same time it will be shown that it is rare for one element only to be affected; when one of the elements which constitute the picture is injured, the effects generally make themselves felt on the remaining elements.

Damp and heat are the chief natural destructive agents. In addition there is the possibility of splitting in the case of a wood panel, and tearing in the case of canvas, owing to violent treatment.

Injuries to the supporting structure may be repaired by cradling in the case of paintings on wood panels, by re-lining in the case of pictures painted on canvas, and by *transference* in the case of either kind of picture. The same processes can be applied to pictures painted on paper. Pictures are also occasionally painted on slate, copper or other metals; in such cases there is very little possibility of repairing any damage to the supporting structure, since the coating of paint which constitutes the picture can only be refixed from the front.

Cradling.—When a picture painted on a wood panel splits owing to rough treatment or changes of temperature, it becomes necessary to join up the pieces which have become separated and to restore an absolutely flat surface to the panel. In order to do this, the pieces are fitted together carefully and are laid, with the painted side downward, on a sheet of marble or glass. They are then subjected to heavy but gradual pressure so that the straightening out of the wood may not be too sudden. If the panel is a thick one, it is better to shave it away so that it may be straightened more easily without there being a danger of its splitting again. It is also a good thing to make the surface of the reverse of the picture perfectly flat so that the cradling may be carried out more satisfactorily. If the panel is very badly damaged it may be backed with another; the actual cradling is then carried out on the second panel. Cradling consists in gluing a series of small pieces of wood at small and regular intervals over the whole surface of the reverse of the picture. The wood selected must obviously be perfectly dry; and in order to prevent any fresh damage due to changes of temperature, care is taken not to glue the pieces of wood to one another at the points of intersection.

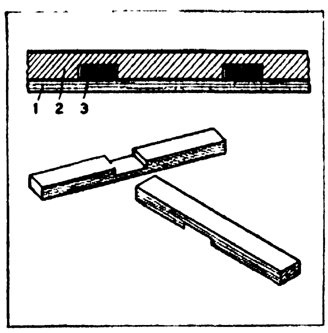

FIG. 1.—CRADLING

Re-lining.—The tearing of the canvas of a picture by a fall or some other accident always impresses the general public as a particularly serious disaster. The injury may in fact be serious if the vital parts of the picture are affected, but it may be comparatively slight if only the less important parts are damaged. If the canvas on which the injured picture is painted is in good condition, the process of re-lining is applied; in other words, the damaged fabric is reinforced by the process described on next page

The painted side of the damaged canvas is first covered with a sheet of paper for protection, and the reverse side is then carefully cleaned and covered with two coats of fish-glue. It is then covered with gauze applied by means of a special kind of glue made of a mixture of rye flour and wheat flour,

fish glue and a little Venetian turpentine or molasses. The new canvas, which must be of pure linen and carefully sponged, is then stretched on a temporary frame larger than the picture to be re-lined. These preparations having been completed, the new canvas and the reverse of the old canvas are glued together by means of the special glue described above; when the two canvases are placed one against the other; any inequalities in the thickness of the glue are pressed out with a spatula. The re-lined canvas is then ironed several times; this is of great importance in order to make the junction between the two canvases complete. When the junction is effected and the glue has completely dried, the protective covering of paper is removed from the picture and the re-lined canvas is stretched on its permanent stretcher. Any gaps in the painting made by the tear are filled in with a mastic made of carbonate of lime, fish glue and a little Lyons glue. It need hardly be said that this is only an outline of the process of re-lining, and similarly, only an outline of the process of transference will be given; it will be readily understood that these operations require the most detailed attention, and that proper time for drying must be allowed between the different stages.

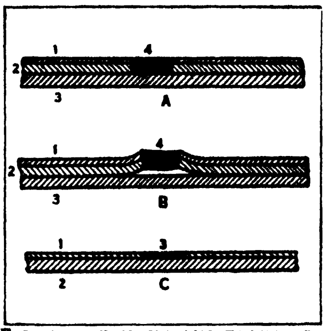

FIG. 2.—RELINING AND TRANSFERING

It has not been thought necessary to deal with the summary, but only too common, method of repair which consists in gluing a patch at the back of a tear in the canvas. Only the very smallest tears can properly be mended by means of patches. If the patch is of any size it gives the original canvas insufficient support, and after a certain time the surface of the picture will be spoilt by undulations. Re-lining is the least that is necessary if the two edges of a tear are to be absolutely prevented from showing. If re-lining is not done properly, the remedy is worse than the disease. Supposing one canvas were simply to be glued hastily on to the other, there would soon be a number of air-bubbles between the two, while in other places there would be spots where the glue was too thick, and these would ferment and cause mildew. In addition, the edges of the tear would gradually detach themselves from the new canvas and would rise up. Hundreds of celebrated pictures have been re-lined, Velazquez's "Venus" (National Gallery), Rembrandt's "La Religieuse" and so on.

Transference.—It is frequently necessary to repair wood panels which have become worm-eaten or are not strong enough to support the weight of a heavy painting, or sometimes have rotted owing to damp. Again, it may happen that the isolating preparation covering the panel or canvas, which was mentioned as one of the elements constituting the picture, does not adhere properly to the supporting structure, or does not adhere to the actual painting, so that it scales off or forms blisters. In such cases as these, re-lining is clearly useless; it becomes necessary to save the painting itself. The operation which aims at preserving nothing but the coating of paint which forms the actual picture is that known as transference. The painting is removed from the damaged panel or canvas and transferred to a new supporting structure which is in good condition. The children's game known as "transfers" will give some idea of the process of transference.

In order to prevent any portion of the original painting from falling or being displaced, two thicknesses of tarlatan and two of paper are first lightly glued to the painted side of the picture. The painting itself being thus protected, the picture is turned over, and the process of removing the supporting structure is begun. If the support in question is a canvas, it can as a general rule be removed fairly easily either by damping it, or by subjecting it to heat so as to dissolve the original glue between the canvas and the isolating coating on which the actual painting was done. If there is no glue it is more difficult to detach the canvas, and it has to be gradually scraped away until the isolating coat is reached. This is the case where the support is a wooden panel; the only possible means is generally to plane it away. When the reverse of the picture has been laid bare in this way, it only remains to re-line it. This can be done by several methods, more or less simple or complicated as preferred by the operator. Some cover the reverse of the painting with a coating of white lead in order to strengthen it, and interpose layers of tarlatan between this and the new canvas; others glue the new canvas as directly as possible to the painting by means of *caséine*. Here again it must be remembered that the process involves a number of detailed operations which it is not necessary to mention here, and that the utmost care and great skill are required.

Difficult as the operation is, it may unhesitatingly be recommended in preference to re-lining. However skilfully re-lining may be carried out, it necessarily involves fixing closely together two tissues of different composition and age, which are not equally sensitive to changes of temperature. It follows that after a certain lapse of time the two canvases undergo dissimilar changes and become loosened; the edges of the old tear in the picture cease to adhere to the new canvas, because the place of the tear is a weak point since at that point there is only one thickness of canvas; it thus forms a sort of hinge which comes into play whenever the canvas is expanded or contracted by heat or damp.

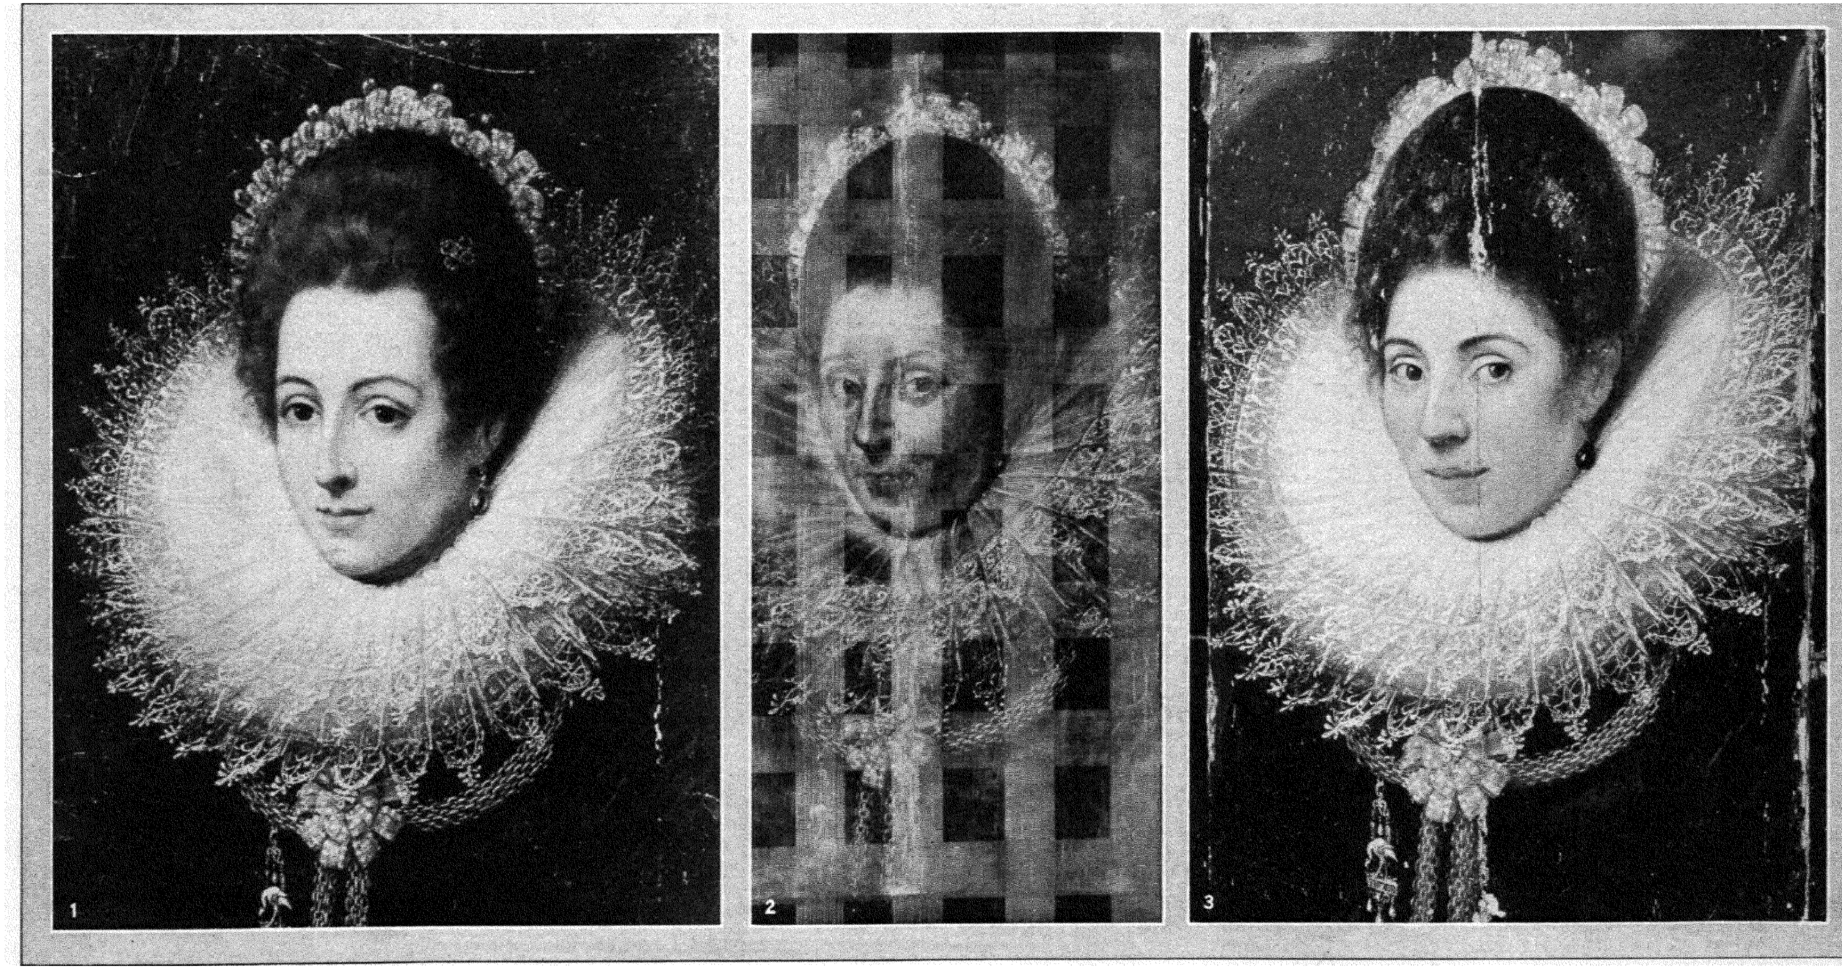
After a certain time the mastic which has been used to fill the gap made by the tear is bound to scale off because it is inelastic; the foundation of the restoration is thus destroyed. The importance of this danger has no doubt been exaggerated in the above account in order to make clear the possible defects of re-lining. No such danger however exists if the process of transference is applied, since there is only a single tissue to be affected by variations of temperature; in addition, the volume of the mastic used to fill the gap is negligible, since its thickness is only that of the layer of paint and not that of the canvas.

The public is still very much impressed by the difficulty of the process of transference, and since the operation is a long one and cannot be carried out except by a really expert worker, picture restorers often hesitate to undertake it. Thanks to transference, we still have masterpieces like Raphael's "La Petite Sainte Famille" and "Saint George." They were treated by Picault in 1751 and this is probably the date of the invention of the process.

De-varnishing.—It is logical to deal first with the varnish, since the restorer has to deal with it before actually restoring the painting, and because, owing to the action of various factors, it is rare for a picture to retain the original quality of its varnish. There are cases in which the original varnish can and should be preserved; but as a general rule, if the restoration which a picture requires is at all extensive, it is necessary first to remove the varnish. Of all the problems which arise in connection with picture restoring, that of de-varnishing is by far the most important. Defective re-lining can be remedied, and repainting which has been badly done by an ignorant operator can be removed without damage to the original picture, but bad de-varnishing may do irreparable harm.

Varnish is made of resin dissolved in oil, essence of turpentine, or alcohol—to mention only the most usual solvents. Just as the fusing of siliceous sand, itself an opaque substance, produces a transparent substance, glass, so the solution of resin produces a transparent substance, varnish. The principal use of varnish is that it preserves the intensity of colour of pigments. In addition, however, even the extremely thin layer of varnish which is all that should be applied to a picture has an extraordinary isolating effect. Varnish protects a painting from emanations of all kinds which might destroy the brilliance of its colouring as well as from the dust which progressively accumulates on it owing to the dampness of the air.

There are some old pictures which have never been varnished; in such cases it is an exceedingly difficult matter to remove the impurities adhering to the painting itself; the painting is also injured by the fact that its different colours have been differently affected by chemical action. For example, it has occurred that in a picture representing the setting sun, what was originally the brightest part of the sky has been transformed into a dark patch because it contained vermilion, a colour containing sulphide of



BY COURTESY OF (1, 3) THE METROPOLITAN MUSEUM OF ART, NEW YORK, (2) THE FOGG MUSEUM OF ART, HARVARD UNIVERSITY

DETECTION OF FRAUD IN PAINTING BY THE X-RAY

1. "Portrait of a lady," supposed to have been painted by Franz Pourbus the Younger (1570–1622). Flemish. This was the state of the painting, with the face completely repainted, before the X-ray test was made
2. Shadowgraph, X-ray view of "Portrait of a lady," by Franz Pourbus the Younger, showing a different face. The X-ray reveals an inside view, showing the strokes of the under-painting or preparatory workmanship, which are covered by repaint
3. "Portrait of a lady" by Franz Pourbus the Younger, after the painting was cleaned, showing the same face as seen in the X-ray

EXAMPLES OF PAINTING RESTORATION

1. "Tribute to the Good Thief," by François Eisen. This picture depicts the dealers of the period with damaged paintings which are about to be altered in secret studios in imitation of the styles of famous painters. They are being laid before "The Good Thief" to invoke his protection. 2. Example of a picture filled in with mastic. After relining, the missing portions of the picture have been filled in with a special mastic over which the painting will be restored. 3. "The Holy Family," by Raphael. This famous picture was the first to be transferred from wood to canvas in Paris. This was effected by Picault in 1750. 4. Example of a torn picture. Once however it has been relined, filled in with mastic and carefully restored, its defects will no longer be discernible. 5. Example of a picture with damaged surface. Because of an injurious process of cleaning, the coating of paint has been rubbed until the texture of the canvas shows white through the paint. 6. Example of a scaled picture. In such a case relining will not suffice and it is necessary to transfer the picture

mercury, which is particularly liable to deteriorate. This would not have occurred to nearly the same extent if the painting had been varnished. The influences which damage paint also damage varnish, but the varnish can be removed, and the painting itself is then found intact, without injury to the specially vulnerable colours.

Varnishes are of course not all of equally good quality, and they may become darkened to a serious extent. This is generally due to the excessive use of varnish often made by collectors or dealers who want to give an appearance of increased freshness to the pictures in their possession. Even the best varnish, however, does not retain its specific qualities if it is applied at more than a certain thickness; it darkens and becomes opaque.

It may happen that a picture requires revarnishing. Before this is done, however, an attempt should always be made to regenerate the old varnish. If the old varnish has ceased to be transparent, it is possible to re-dissolve the molecules of resin which cover the painting by means of alcohol vapour. This is an ingenious method by means of which it is possible to restore the varnish to its original condition, which it will retain for a considerable number of years, without loading the painting with a fresh coat of varnish. Thus was Rembrandt's "Ronde de Nuit" restored in 1889 (fig. 3).

In order to regenerate old varnish, the picture must first be wiped, and then washed by means of wads of cotton dipped in water without soap. This removes the dust which has been more or less fixed on the picture by the moisture in the air. A receptacle (1) the exact size of the picture and 15–20 centimetres deep is then prepared; a wooden box will serve. The bottom of the receptacle is covered with a layer of down thoroughly soaked in 90% spirit. (2) The picture is laid on the box with the painted side downwards, *i.e.*, facing the down soaked in spirit. The time required for the regeneration of the varnish varies in the case of different pictures from 15 minutes to several hours; in some cases the desired effect is not produced at all.

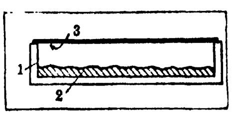


FIG. 3

If a picture has been damaged and needs to be restored, or if the colours are altered by too many coats of varnish, it needs de-varnishing. One is often painfully impressed by seeing famous masterpieces in the various museums of Europe the colours of which are completely distorted by the darkening of the varnish; and a general de-varnishing of thousands of pictures might be undertaken with advantage. In theory it would be better to see great pictures as the artist painted them rather than as they appear under the influence of old varnish. Unfortunately, however, it must be admitted that the work cannot be carried out because there are not enough expert workers available. It is therefore better to exercise great caution, and not to be in too great a hurry to restore fine pictures, but to wait for the day, which must soon come, when a sound tradition has been created. It is only fair however to recognize the good work which has been done in the past by intuitive artists who have tried processes which, if they had been developed, might have hastened that day. But the experiments which were tried were isolated, and no tradition was created. Thus only too many restorers have, with a desire to avoid trouble, tried to de-varnish pictures simply with a mixture of essence of turpentine and alcohol. This method is easy and rapid and unfortunately it sometimes gives excellent results. We say "unfortunately" because the fact that the method is sometimes successful leads to its being applied in all cases, and this is to be regretted because the method sometimes causes damage which cannot be foreseen. Some pictures which are painted strongly, in light tones and without scumbling will stand the process perfectly well; in others the surface is at once spoilt, and in addition, alcohol is dangerous for dark and transparent tones and for all scumbling.

What is needed for de-varnishing is not a rapid solvent, but something which will soften the varnish gradually. It is necessary to keep the operation well under control the whole time, and not to use a method which gets out of hand. The work must be slow if it is to be safe. A Van Goyen, painted in transparent browns applied directly on wood, a Reynolds, the colour of which is sometimes applied simply by scumbling on a ground of *grisaille*, or a Debucourt, are extremely difficult to de-varnish properly. Excellent and sure results can however be obtained if we have patience to attack the varnish not all at once (as is done by alcohol, alkali, soap containing potash, or acetic acid applied without precaution) but gradually. This makes it possible to modify the process in the middle of the operation when one coating of varnish has been removed, and we arrive at another coating which may be of an entirely different composition. For it may be taken almost as an axiom that all pictures have been varnished more than once.

Many people advocate the rubbing off of varnish. It is true that certain varnishes can be rubbed off by the fingers, and that this method can be used for de-varnishing small pictures painted on a smooth surface; but it is defective and irregular, if not impossible, if there is much *impasto.* On the other hand, oil of aspic, copaiba balsam, cedar oil, sulphuric ether and xylol may be used successfully either separately or in combination; they have the advantage of allowing a trained expert to recognize the nature of the varnish which he has to remove and to choose the most appropriate formula for his work. If judiciously used alkali, acetone and acetic acid which have been mentioned as dangerous may be of great value. It must be emphasized, however, that de-varnishing ought to be perfectly successful and perfectly safe. Different methods should be used according to the nature of the picture and the varnish with which it is covered, for in this work each case should be considered individually. If there is nothing wrong with the picture except that the varnish is too dark it is sufficient to revarnish it lightly after the old varnish has been removed. It is, however, better to wait before doing this for a sunny day so as to be sure that no moisture is retained between the paint and the varnish.

Restoration.—It is now necessary to consider the case of pictures which have to be restored after the old varnish has been removed. It very rarely happens that an old picture has not suffered from scratching, if from nothing worse. The preceding paragraphs have dealt with re-backing and transference; these processes presuppose some injury to the painting itself which has to be repaired.

It would take too long to distinguish between all the various kinds of damage which may necessitate the restoration of a picture, that is to say the reconstitution of the painting itself. For the sake of clearness they may be divided into two categories: (1) *absence of paint,* which may be due to a hole, a tear, or to scaling off; (2) *wearing of paint,* which may be due to changes occurring in the paint itself; *e.g.,* when a red or brown ground works through scumbling which has been applied over it too lightly, or to friction by foreign bodies, or, what is unfortunately the most frequent cause, to previous cleaning operations which have worn away lightly painted details or damaged fragile colours, such as scumbling on the one hand and all dark tones on the other.

Retouching.—In addition to the above two kinds of injury, there is another factor of great importance—that of old retouchings. By "re-touchings" we understand restorations which go beyond the area of the injury which they were intended to repair. When this has been done, the work of restoration is rendered doubly difficult, because if the work is to be properly done it is first of all necessary to remove all the additions which have been made to the original painting. A trained eye can generally detect re-touchings at once, and can guess whether they have gone beyond the actual area of the accident.

Ultra-violet rays and X-rays are of great service in this connection. Under the action of ultra-violet rays, colours, at any rate if not covered with varnish, are transformed in accordance with their chemical composition, and it may happen (though it is not safe to generalise) that "values," or colours which closely resemble one another by natural light, are completely differentiated by ultra-violet rays. If the paint used for re-touching is not of the same chemical composition as that of the original picture, it will at once appear under ultra-violet rays as a patch of a different colour.

X-rays perform a similar service for a different reason. It is well known that the greater the atomic weight of a body, the

more difficult it is for X-rays to pass through it. (*See* X-RAY.) Consequently a re-touched area, which represents a greater body of material on one part of a picture, is shown up by the fluorescent screen. Here again it is unsafe to generalize, for certain colours, such as browns, emerald green and madder, are of such low atomic weight that they are scarcely shown by X-rays. On the other hand, X-rays reveal the exact limits of an injury. When we see that a painting has been retouched, or even, as sometimes happens, completely painted over, we may hope that the real extent of the injury is not so great as the re-touching would lead us to suppose. By the use of X-rays it is generally possible to discover the exact area of the mastic underneath the retouching, as the atomic weight of the mastic is sure to be different from that of the wood or canvas on which the picture is painted.

When a picture restorer wishes to remedy a loss of paint due to a hole, a tear, or scaling off, he should confine himself to reconstituting that part of the picture from which the paint is absent and has had to be replaced by mastic. We do not consider that he is morally entitled to go one-tenth of a millimetre beyond the area of the mastic.

If the paint is rubbed or worn away, a much higher technique is needed for its restoration, for it is a temptation to employ the easiest method, which would be to repaint it. On the other hand taste, power of selection, respect for the artist whose work is being restored, and a thorough comprehension of his art are needed to restore scumbling which one is certain has been worn away. In any case, no attempt should be made to repair the effects of wear unless they really interfere with the unity of the painting.

There was actually a time when great picture galleries re-varnished all their paintings whenever an important personage was to make them an official visit. Similar errors have been committed in the actual restoration of pictures; there is absolutely reliable documentary evidence to show that in some of Rubens' pictures the red draperies have been entirely repainted, and that when there was an injury to an arm or a leg, the whole of the arm or leg was repainted. This was what happened also to Raphael's "St. George" mentioned above. One of the legs had been entirely repainted and these useless retouchings had to be removed. Many similar restorations may still be seen at the present time. There is another reason which explains why ancient retouchings, even if conscientiously carried out, are so conspicuous at the present day; this is that they were done with oil paints. This brings us to important aspects of the technique of retouching in the strict sense of the term.

It would at first sight appear normal to retouch oil paintings with paints prepared in the same way. It must not however be forgotten that all paints are subject to more or less rapid modification under the influence of time. In the case of tempera, fresco and gouache painting, the transformation is almost instantaneous, while oil painting does not complete its development until months and sometimes many years after it was executed. When that stage is reached, if the painting as a whole is in a good state of preservation, the colour harmony may be considerably different from the colouring of the painting when fresh. Retouchings executed with oil paints, even very skilfully, on an old picture the colours of which have been modified by time, may be perfect when it is done, but will only remain so for a few days or at the most for a few months; after that the new colour, which at first exactly matched the old, will in its turn be modified and will inevitably show. A clever restorer will of course take pains to prepare a very light ground with unmixed colours and will cover this with a very light film of colour in order to arrive at the tone finally required, and in this way will do all that is possible to prevent the paint from changing a great deal. In spite of everything, however, the results thus obtained will only be satisfactory for a certain time, and attempts have therefore been made to mix oil paints with all sorts of other ingredients in order to retard the action of time on them. The next experiment was to grind colours with turpentine and without oil, and in order to give them consistency, to paint with varnish with a resin and turpentine basis. This represented real progress. The colours were still subject to modification, but they changed more rapidly, and it was easier to foresee the future effect of restoration. Most restorers still use this process. Although the varnish complicates the work, the colours remain easy to handle, and it must be admitted that restorations executed in this way may last for a long time, particularly if the ground is carefully prepared and the final coat very light.

The object in view is not, however, to carry out restorations which will have to be done over again, even at a comparatively distant date. After a number of experiments with water-colours, gouache colours, etc., it was decided to try restoring pictures with brilliant tempera colours, *i.e.,* colours ground with yolk of egg. It is true that this process renders the task of the restorer incomparably more difficult. Tempera colours dry very rapidly; long practise is necessary to make them produce the fluid effect of certain old paintings. Moreover, the colour becomes much higher in tone after a few hours, and the extent of the change varies enormously according to the mixture used. It is thus necessary to foresee what the colour will be after it has changed in order to bring it into accord with the fixed colour of the original work. It will readily be understood that much experience is needed in order to obtain satisfactory results with tempera colours. On the other hand, the change which takes place in tempera colours after a few hours is complete in a few days. In other words, the transformation which takes many years for oil paints is accomplished in a week. Moreover, tempera painting takes varnish just as well as oil painting.

It was stated at the beginning of the present article that what the art of picture restoration has lacked throughout the centuries is a sound tradition. Really encouraging results have been achieved, but it must be clearly understood that restoration is a vocation rather than a trade. In order to practise it, it is first necessary to be a real painter, and in the second place to make a constant study of the practical methods which the old masters used to achieve their artistic aims. However much their works are searched, the number of discoveries which have been made remains limited. At any rate a study of this kind will show that the one supreme quality which a restorer should possess, if he is to try his hand on great works of art, is the gift of respect.

DETECTION OF FRAUD

The existence of countless fraudulent paintings is generally acknowledged. Apart from the more obvious cases which have reached law courts and publication, there are numerous references in the note-books of artists to the making of copies which, although legitimate in their original purpose, have become fraudulent in the hands of opportunists. In a similar way the work of pupils, supervised or corrected by a master, and put out originally as shop work, has been made in later times to pass for the work of the master. One therefore must distinguish between the several types of forgery. The work deliberately manufactured at first hand in imitation of older work constitutes an important first class—sometimes most difficult to detect. Next to this are the groups dealing with the transformation of something already existent into something else, such as the refinishing of a crude school piece in the master's manner, or the remounting of fragments of an old picture to serve as the skeleton of a finished work, or even the mounting of an overpainted chromolithograph on a decayed piece of wood or canvas to imitate the appearance of an old picture. Perhaps there should be a separate classification for some kind of repair work on damaged pictures; in this group the forgery consists in falsifying what remains of the original. But in all kinds, the forgery may be considered as a substitution,

whether of colour, or brushwork, of subject, or of spirit and conception, with or without the intention to deceive. In order to guard against this imposition the expert must be able to recognize the clues which point to its existence.

The material differences between the true and the false suggest chemical and physical analysis; the spiritual differences suggest psychological and historical analysis. In effect the expert makes use of any means that suggest themselves to him. Chemical tests may determine the composition of colours, of which the date of discovery is known. (*See* PAINT, CHEMISTRY.) The presence of Prussian blue, for example, in a painting supposedly of the 15th or even the 17th century is absolute evidence of forgery or repainting. The needle test, mainly of anecdotal value, shows whether or not the oil in an oil painting has hardened; if the paint cracks when the needle is inserted, the oil has solidified; if the needle's hole is round and unbroken at the edges, the oil medium is probably less than 30 years old, according to some, or less than 50 years old, according to others. A strong magnifying glass or low-powered microscope may determine whether apparent cracks are natural or have been drawn in with a sharp point. Polarized light has been suggested as a means for seeing beneath the dirty varnish, glaze and repaints in certain types of painting.

By far the most common method, however, if it is properly a method, for determining forgery is by means of the emotional sensitiveness which develops from long familiarity with works of art Critics, necessarily in sympathy with their subject, mark slight deviations in spirit, form and style which indicate the presence of something alien—a forgery or imitation of a known model. Detection of such deviations presupposes, of course, a complete knowledge of the art imitated and a range of information wide enough to develop what are at first merely suspicions into proofs, demonstrated by whatever historical and inferential facts can be found to support the primary emotional one. The critic's hypothesis ordinarily is derived from emotional experience, and the proof from technical data.

Recently the X-ray has been added to the expert's equipment. And it has become exceptionally useful, when useful at all. It combines in one test opportunities to study the physical consistency of a picture and the psychology of the artist. It reveals the variations in density and thickness of the material forming the work of art, thus recording the touches of pigment which differ from one another in kind as well as in handling; it also may show the strokes of underpainting or preparatory workmanship not visible on the surface Consequently the X-ray film records an inside view and adds to the technical data at the critic's command.

The efficacy of the X-ray depends on two conditions First, the pigments in use to-day lack generally the density of the pigments in use prior to about 1800, a date that seems to mark the beginning of extensive research in the chemistry of colours. This means that a forgery in chemically compounded materials differs in density and thus differs in appearance on the X-ray film from a picture painted in mineral and earth colours that have been coarsely ground by hand. Secondly, the degree of skill and sensitiveness of an artist is usually manifested in his brushwork or habits of applying pigment And this means that a modern forger, even if he uses dense colours ground ever so skilfully in imitation of an old method, nevertheless leaves traces of his personality and peculiarities as an artist in his brushwork.

Unfortunately the X-ray itself has not been perfected to the point where the critic can wholly control it; the rays, for instance, have their effects in straight lines and must penetrate all of an object in order to be recorded on a sensitized film. For the purpose of art criticism it would be valuable to direct the rays through only one layer of material, that is, to obtain an X-ray of pigment only, without having to penetrate a ground of gesso or lead paint, as well as a panel or canvas, sometimes coated on the reverse with more material, all of which confuses the appearance of the artist's workmanship. This limitation, however, does not affect the X-ray's value under better conditions. Given a picture forged in modern material, regardless of style or craft, the X-ray shows the lack of density of the paints and the incompleteness or shallow nature of the cracks which, when hammered or scratched on the surface, differ from the cracks which have developed with the slow drying and long condensation of the materials. If the forger has utilized an old picture as the basis for a new one, the X-ray easily reveals the hidden part. Repair work that borders on the fraudulent is consistently visible in the X-ray test, since no amount of skill on the restorer's part can blend fresh paint and old paint so accurately that they match in density, thickness and style Finally the X-ray aids a just choice between two pictures that are alike in pigment, aesthetic effect and age. By revealing which picture contains changes in design or corrections characteristic of an artist creating a picture, and which does not, it betrays the mere imitator. With the X-ray's help the critic may explore the process and even the progress in the making of a forgery.

In this way the expert keeps one jump ahead of the forger, who is ever forced to new efforts as the scientific aids in the detection of false painting are developed

PAINTS, CHEMISTRY OF. The character and value of paints may be considered in relation to their use, either for artistic and decorative purposes, or as preservative coatings. In the former case, for a given medium, the choice of pigment rests primarily upon the colour effects desired; in the latter case the medium plays a more important part, whilst the choice of pigment depends on its chemical and physical properties and on a consideration of cost. Through scientific progress an almost unlimited variety of colours is now available

The opacity or transparency of a pigment in a medium is determined by the amount of refraction and reflection which light undergoes in a paint film. This depends upon the difference between the refractive indices (to air) of the pigment and the medium respectively, the pigment approaching transparency as such difference diminishes As the refractive index of oil is higher than that of water, the opacity of a pigment will be greater in the latter vehicle than in the former. In the case of oil colours the refractive index of oil increases as the drying proceeds, and thus produces a lowering of tone owing to the increased transparency of the pigment; in water colours the refractive index of pigment to water being less than that of pigment to air causes an increase in opacity of the colour on drying. Opacity is generally intensified by increased fineness of the pigmentary particles. Reduction in the particle size may also modify the colour of a pigment as is shown in the manufacture of lead chromes and antimony sulphides. For this reason colours such as vermilion are materially altered during the process of grinding in oil, unless special care is exercised in the operation. Pigments ground in oil exhibit a great variation in behaviour. This is manifest in the amount of oil required to grind them into a paste (known as their "oil absorption"), and in their influence on the drying of the oil and on the subsequent character of the paint film, rendering it soft and pliable or hard and brittle. Differences in oil absorption are well illustrated in the cases of vegetable black and white lead, the former requiring about twelve times as much oil as the latter.

Pigments classified according to their colouring principles fall into two main groups: (1) mineral or inorganic colours, and (2) colours produced from the natural or synthetic dyes (*q v.*). As the manufacture of mineral and inorganic colours is directly associated with their chemical constitution, which varies over a wide range, their preparation cannot be generalized Broadly a division might be made between those pigments, *e g.*, the chromes, made by the "wet process" and involving the precipitation of the colour from solution, and those pigments, *e g*, the cobalt colours, where the desired result is obtained in a furnace at a high temperature. Some colours, such as lithopone, require treatment by both processes. By whatever method the colour is obtained, adequate washing is essential. This is usually carried out in the "striking" or precipitating vats by decantation, the process being repeated until the wash water is free from salts. The washed colour is pumped through a filter press to remove excess of water and dried in a drying-room at a low temperature or in a vacuum stove

The manufacture of organic colours is equally complex and

diverse. The term *lake* is applied to all pigments prepared by the precipitation of dyestuffs upon a "base" or "carrier." This base, which contributes largely to the physical properties of the lake and is selected according to particular requirements, either adsorbs the dye, enters into direct chemical combination with it or forms the substratum on which the dye is fixed by a precipitant. The choice of dye is naturally governed by the demands of the lake user; such considerations as price, permanency and insolubility in the medium may serve as determining factors.

As bases, are used the hydrate and certain salts of alumina (for transparent lakes), barium sulphate, china clay, zinc oxide, lead sulphate, red lead, litharge, green earth and others. Besides entering into chemical relationship with the dyestuff, these bases may further serve as *extenders* (or diluents) or combine both properties. Extenders are employed in both classes of pigments and cannot be considered only as adulterants; thus, when used for producing paler shades, for increasing opacity and obscuring power ("body") of colours, or for modifying the properties of a pigment to suit a particular need, they serve a special purpose.

White Pigments.—*White lead,* of which Flake White and Kremnitz White are varieties, approximates in composition to the basic lead carbonate $2PbCO_3 \cdot Pb(OH)_2$, and possesses greater covering power than most white pigments. Used as an oil colour, its films are prone to yellowing in the dark; this discoloration, which is attributed to the basic character of the pigment and is less marked with the normal carbonate, disappears on re-exposure to sunlight. Though readily blackened by sulphuretted hydrogen, it has great atmospheric durability and is unaffected by light and sulphur dioxide. Its resistance to sulphides is greatly influenced by the presence of lead acetate as impurity; pure white lead in oil is stated to be compatible with ultramarine, cadmium yellow and vermilion without discoloration. On account of its poisonous nature many attempts have been made to replace it, but always with a sacrifice of covering power or durability when used for external painting. Of the more notable substitutes, the following may be mentioned:—Mulhaus White (lead sulphate); Freeman's non-poisonous White Lead, a mixture of lead sulphate, zinc oxide, magnesium carbonate and barium sulphate; and Sublimed White Lead, a basic lead sulphate containing zinc oxide. Lead sulphate being deficient in body is used mainly in admixture with other pigments, *e.g.*, lead chromes, to produce paler shades.

Zinc White (Chinese White, Zinc Oxide) was first proposed as a white-lead substitute by Courtois of Dijon in 1780 and became generally adopted as an artistic and industrial colour in 1840. It is a brilliant white possessing considerable covering power though lacking in opacity, is non-poisonous, and is unaffected by light or sulphuretted hydrogen. As a water colour it is incompatible with most pigments, this being more marked when gum arabic is used as a medium. In oil the paint dries slowly to a hard film having a tendency to scale; it is extensively used in white enamels. As an artists' colour it is sometimes preferred to white lead, but owing to its higher oil absorption it is more readily lowered in tone by the physical changes in the oil. *Lithopone* is a white pigment obtained by precipitation of zinc sulphide and barium sulphate simultaneously in approximately molecular proportions and subsequent calcination. The properties of Lithopone depend largely on its purity and method of manufacture; thus in particular may be mentioned its tendency to darken in sunlight. This discoloration is reversible and the white colour is restored in the dark. Owing to its non-poisonous nature, stability to sulphuretted hydrogen and atmospheric influences, and its good covering power, it is used in considerable quantities as a water, size and oil colour; in textile printing; in the manufacture of linoleum and in many other industries. *Titanium White* (Titanox, Titanium Oxide) is a white pigment of exceptional body and covering power, far exceeding that of white lead or zinc oxide, in admixture with which latter pigment it is often employed. Owing to its chemical inertness, it is unaffected by atmospheric influences and is non-poisonous. As a paint its films do not crack or peel but show a strong tendency to "chalk," a defect arising from the gradual destruction of the film in moist air. *Antimony White* (Timanox, Antimony Oxide) was introduced as a white-lead substitute during the World War, and has since found extended use in the manufacture of paint and linoleum. It is non-poisonous and is less prone to discoloration than white lead.

Among the white pigments are also found most of the bases used in colour-making as extenders and adulterants: Barytes (Barium Sulphate), which occurs naturally as "Heavy Spar" and is produced artificially as "Blanc Fixe" (Permanent White); Hydrate of Alumina (White Lake); Whiting (Calcium Carbonate); Terra Alba (Calcium Sulphate); China Clay; and others.

Yellow Pigments.—*Lead Chromes* form by far the most important class of yellow pigments. These cover a variety of bright shades of yellow ranging from a pale primrose (in which the chrome is intimately admixed with lead sulphate or arises direct as a precipitation of a lead sulpho-chromate) to a deep orange-red. The orange and deeper shades owe their colour more properly to the formation of basic lead chromates; the physical state of the pigment, however, plays an important part and is largely dependent upon the condition under which the chrome is made. The lighter varieties of lemon (neutral) lead chromates, Chrome Yellows, are produced at a low temperature, by using very dilute solutions or otherwise controlling the process so that the precipitate is maintained in a very fine state; such chromes possess good covering power, a property diminishing as the shade deepens, owing to the consequent increase in the specific gravity of the colour. The raw materials employed in the manufacture are lead nitrate or acetate and the precipitant is the dichromate of sodium or potassium; for the deeper shades, basic salts of lead are used, or the chrome receives subsequent treatment with caustic alkali.

Zinc Yellow (Zinc Chromate) is inferior to Chrome Yellow in body and covering power but is not blackened by sulphuretted hydrogen. It is used mainly as an oil and water colour in the production of lime yellows, and in the manufacture of the non-poisonous Zinc Greens by admixture with Chinese Blue. *Cadmium Yellow* (Cadmium Sulphide) possesses excellent covering power and is largely used as an oil and water colour. The shades of pure cadmium sulphides depend essentially upon the method of preparation and vary from bright lemon yellow to orange. In the manufacture of cheaper varieties of the paler shades, the cadmium sulphide is often admixed with cadmium carbonate, giving a product of good body but prone to fade in moist air. A cheap pigment fast to light is obtained by the simultaneous precipitation of cadmium and zinc sulphides, providing no carbonate is present. Compounds of cadmium sulphide with cadmium selenide in varying proportions form a further series of colours covering a range from orange to maroon-crimson according to their composition; such pigments are largely applied in the ceramic industries owing to their heat-resisting properties. A new series of compounds have been recently introduced in which cadmium sulphide (with or without selenide) is precipitated together with barium sulphate to form Cadmium Lithopones (*cf.* Lithopone, above), which on account of their comparatively low cost lend themselves to more extended industrial applications. Cadmium yellows form a stable series of bright greens with Ultramarine. *Aureoline* (Cobalt Yellow), possesses only moderate stability to light, but is unaffected by sulphuretted hydrogen and is used mainly as an artists' oil and water colour and for the production of pure blue shades in glass and porcelain painting. It is transparent in oil and turns brown in excess of this medium.

To the yellow pigments belong also the Ochres, King's Yellow, Orpiment and Naples Yellow.

Red Pigments.—*Red Oxides of Iron,* by far the most important series of this group, vary in colour from a deep bluish-red of ferric oxide, Fe_2O_3, which they contain. Ferric oxide occurs to a pale red-brown according to their purity and the percentage naturally in numerous varieties of the red iron ore, haematite, in red ochre, red bole or raddle, in crude red iron-stone and micaceous iron. The conversion of these ferruginous minerals into pigments is relatively simple and consists generally in grinding and levigating the material to remove impurities and to attain the required degree of fineness; in many cases the shade of the product needs to be modified by calcination whereby any ferric hydroxide is

changed into the red ferric oxide with consequent reddening of tone (*cf.* OCHRES). Large quantities of iron compounds, by-products of industry, are now economically worked up for the production of artificial iron oxides of great purity, their shade depending on their method of treatment and the temperature at which they are "burnt" or heated. Iron oxides are marketed under various designations according to colour and purity, such as English Red, Indian Red, Persian Red, Turkey Red, Caput Mortuum, Colcothar, Rouge, Venetian Red and many others. In certain cases, *e.g.*, Madder Indian Reds and Tuscan Reds, the oxides are brightened by the addition of a permanent red lake; such toning is readily detected by chemical means. When of high ferric oxide content, they possess considerable covering power and opacity and are highly resistant to atmospheric influences; they are used extensively as oil colours, as a pigment in rust preventive coatings, in calico printing, for colouring porcelain and glass and in many other industries.

Red Lead is a lead tetroxide represented by the formula Pb_3O_4, produced by heating litharge (PbO) in air at about 480° C. The commercial varieties usually contain from 6 to 12% of free litharge. It is a bright scarlet-red pigment possessing good covering power, opacity and permanence, and on account of its anti-corrosive property is extensively employed as a priming coat for iron and steel structures. It exerts a strong drying action on linseed oil and its hard-setting properties render it valuable in this medium in making cements, lutes and packing for steam joints. It is used as an oil colour, as a base for organic lakes, for manufacturing lead and optical glass, enamels, in other industries.

To the red pigments also belong Vermilion, Carmine, Cadmium Scarlet (*cf.* Cadmium Yellow), Antimony Vermilion, antimony trisulphide, Chrome Red and a large number of organic lake pigments.

Green Pigments.—Two main classes of green pigments are in use: the "elementary" and the "composite."

(a) Elementary Greens.—*Chrome Oxide Green*, chromium sesquioxide, Cr_2O_3, is produced by the reduction of potassium dichromate at a high temperature, by calcination of ammonium dichromate or chromic chloride, and similar processes. It is one of the most permanent pigments known, and is unaffected by heat, light, acids, alkali, chlorine and other reagents. It is used as a water, lime and oil colour; in printing inks, in which it possesses non-actinic properties; as a mordant in calico printing and dyeing; as an abrasive for polishing steel and precious metals; and in many other industries. *Guignet's Green* (Viridian) is a hydrated chromium sesquioxide produced by heating potassium dichromate in the presence of boric acid or other flocculating agent. It is a pigment of great permanence, possessing similar properties to chrome oxide green, from which it may be distinguished by its solubility in boiling hydrochloric acid. Its covering power and strength are only moderately good; it is used for chrome oxide green and also admixed with chrome yellow as a pale green for landscape painting. *Cobalt Greens* are not true chemical compounds but solid solutions of zinc and cobaltous oxides obtained by calcination in a manner similar to the cobalt blues. They possess great permanence and are unaffected by heat, light, sulphuretted hydrogen, etc., are non-poisonous and are used as artists' oil and water colours. *Green Earth* is a natural alkali–aluminium–magnesium–ferrous silicate of variable composition. It is an inert and permanent pigment deficient in colour and is used as an artists' oil and water colour, in fresco painting, and as a substratum for organic lakes, basic dyes, fixed by its silicic acid content, being in some cases rendered fast to light.

To the elementary greens belong Green Ultramarine and the copper greens: Verdigris; Schweinfurt Green and Scheele's Green, copper arsenites; and Malachite Green, a native copper carbonate, which are no longer used, being poisonous.

(b) Composite Greens.—*Chrome or Brunswick Greens*, by far the most important class of greens in general use, are an intimate mixture of Chrome Yellow and Chinese Blue. They possess great brilliancy, good covering power, and cover a wide range of greens according to the relative proportions of their constituents, which determine their chemical stability and permanence. In oil these greens dry well and are darker and more glossy than in water. Being composite in their nature, they are more prone to colour changes, becoming yellower or bluer according to the condition of exposure. Brunswick Greens prepared by grinding together the required proportions of Chinese Blue and Chrome Yellow show a tendency to "float," *i.e.*, the blue rises to the surface of the paint; this is largely obviated by the wet process of manufacture, the two colours being mixed in the striking or precipitating vat, washed and dried. Chrome Greens are extensively used as oil colours; as size colours for paper; in printing inks; in textile printing; and in the manufacture of linoleum. *Zinc Greens* are similar to the Brunswick Greens being a mixture of Zinc Chrome and Chinese Blue. Though more permanent than Chrome Greens, they lack the body and covering power of the latter and on account of their higher price are not extensively employed. They are used as an artists' colour, for tinting enamels and in oil paints and printing inks.

Blue Pigments.—*Prussian Blues* are complex alkali ferric ferrocyanides containing potassium, ammonium, or sodium according to preparation. The most valued blues are "potash" blues prepared from potassium ferrocyanide and ferrous sulphate, with subsequent oxidation. According to the method of oxidation, a number of Prussian blues are obtainable, varying in chemical composition and physical properties. These blues are of low opacity, but possess considerable covering power and are reasonably permanent, though readily destroyed by alkali. Prussian Blue is a dark reddish-blue with a red undertone. By special treatment, blues are produced possessing a high bronze-lustre, known as Bronze Blues, which are much valued in printing. Chinese Blue, the basis of Chrome Greens, is a paler blue than Prussian Blue and is characterized by a violet shade with a greenish undertone. Still lighter blues are the Milori and Steel Blues. Celestial Blue is a paler blue containing barium sulphate. Antwerp Blue is a Prussian Blue formed upon an alumina base. Prussian blues are soluble in oxalic acid; by treatment with this acid and subsequent salting out, Soluble Prussian Blues are obtained. Other soluble blues are made by precipitating ferric chloride in excess of potassium ferrocyanide or by precipitating ferrous sulphate with potassium ferricyanide (Turnbull's Blue). These blues are extensively used as oil and water colours and in spirit and oil varnishes, in printing inks, for staining paper, in textile printing and dyeing, and for toning blacks. *Cobalt Blues* are among the most permanent colours known, and exist in two forms: (1) Smalts, potassium cobaltous silicates of varying composition, King's Blue being richest in cobalt and Azure Blue darkest in colour; and (2) Cobalt Blue or Cobalt Ultramarine, cobaltous aluminate of variable composition ranging from a greenish-blue, which may contain combined zinc, to Thenard's Blue of reddish tone, prepared from alumina and cobalt phosphate. Coerulean Blue is a cobaltous stannate containing magnesium. Somewhat restricted through high cost, they are used as artists' oil and water colours, in oil paints and enamels, for printing inks and in the ceramic industries.

Other blues in extensive use are the Ultramarines and a number of Organic Lakes. The copper blues: Egyptian Blue, Bremen Blue, Mineral Blue, etc., are practically obsolete.

Black Pigments.—*Carbon Blacks* form the main source of black pigments and have as their colouring principle amorphous carbon; these blacks vary in colour and strength according to their origin. Vegetable Blacks are nearly pure carbon, obtained from the incomplete combustion of mineral oils, and are of a deep black shade giving a bluish-black tint on reduction. Lamp Blacks are brownish blacks of rather less intensity, being poorer in carbon, often giving as much as 25% of ash on ignition. Carbon Blacks, obtained chiefly from America by burning the natural gases, are very deep black in colour, denser and more granular than Vegetable Blacks, and are extensively used in the paint and printing-ink industries. Ivory Blacks were originally produced by charring ivory cuttings in closed vessels; these have been largely superseded by the Bone Blacks, which are bluish-black in colour and are considerably denser and weaker than Carbon Blacks, containing only about 10% of carbon admixed

with calcium phosphate and calcium carbonate. Vine Blacks are prepared by carbonizing vine twigs and other non-resinous woods; they are beautiful bluish blacks with great depth of tone and are largely used in printing inks and are much valued as an artists' colour. Mineral Black is a dry grey shale containing about 30% of carbonaceous and 70% silicious matter. It is also prepared from waste coal dust and is largely used in cheap black paints, often tinted with Vegetable or Carbon Black. Graphite is another variety of carbon of absolute permanence, used as a pigment for special purposes, *e.g.*, in anti-rust paints and in the manufacture of "lead" pencils. *Black Oxide of Iron* is a triferric tetroxide, Fe_3O_4, which occurs in nature as the mineral magnetite. It is used as an oil and size colour and in the ceramic industry.

PAISIELLO (or PAESIELLO), GIOVANNI (1741–1816), Italian composer, was born at Taranto on May 9, 1741. He studied under Durante at Naples, and his first compositions were produced at the conservatorio there, where he was an assistant master. At Naples, too, he produced a series of successful operas, and some church music. In 1776 Paisiello was invited by Catherine II. to St. Petersburg, where he remained for eight years, producing his masterpiece, *Il Barbiere di Siviglia*.

Paisiello left Russia in 1784, and, after producing *Il Re Teodoro* at Vienna, entered the service of Ferdinand IV. at Naples, where he composed many of his best operas, including *Nina* and *La Molinara*. He was invited to Paris (1802) by Napoleon, but the Parisians received his *Proserpine* so coldly that he requested, and with some difficulty obtained, permission to return to Italy. He died at Naples on June 5, 1816. Besides his operas Paisiello composed eight masses, fifty-one instrumental compositions and many detached pieces.

See F. Schizze, *Vita di Paisiello* (Milan, 1833); A. della Corte, *Settecento italiano* (Turin, 1922); H. Short, *Paisiellos Buffokunst und ihre Beziehungen zu Mozart* (1919).

PAISLEY, burgh of barony and parish of Renfrewshire, Scotland, on the White Cart, 3 m. from its junction with the Clyde, 7 m. W. by S. of Glasgow by the L.M.S. railway. It is connected with Glasgow, Renfrew and elsewhere by tramways. Pop. (1921) 84,837. In 1791 the river, which bisects the town, and is crossed by several bridges, was made navigable for vessels of 50 tons. Later it was further deepened, and is now navigable for vessels drawing 15 feet. The old town contains most of the principal warehouses and mills; the new town, begun towards the end of the 18th century, occupies much of the ground that once formed the domains of the abbey. To the munificence of its citizens the town owes many of its finest public buildings, among them the town hall, the free library and museum, the observatory, the John Neilson Endover Institute, and the fine Thomas Coats memorial church. Of parks and open spaces there are Brodie Park; Fountain Gardens; St. James Park, with a racecourse; Dunn Square and the old quarry grounds converted and adorned; and Moss Plantation. The burgh returns one member to Parliament and is governed by a council. In the abbey precincts are statues to the poet Robert Tannahill (1774–1810) and Alexander Wilson (1766–1813), the American ornithologist, both of whom were born in Paisley. John Wilson ("Christopher North") was born here.

The village originally grew up around the abbey of Paisley, and the town Paisley has been an important manufacturing centre since the beginning of the 18th century, but the earlier linen, lawn and silk-gauze industries have become extinct, and the famous Paisley shawls (imitation cashmere), are little woven. The manufacture of linen thread gave way in 1812 to that of cotton thread, and Paisley is now one of the chief world centres of thread manufacture. The large mills of J. and P. Coats and Clark and company employ many hands. Other industries include bleaching, dyeing, calico-printing, weaving, engineering, tanning, iron and brass founding, timber yards, and the making of starch, cornflour, soap, machinery and chemicals, besides some shipbuilding.

The abbey was founded in 1163 as a Cluniac monastery by Walter Fitzalan, first high steward of Scotland, the ancestor of the Scottish royal family of Stuart, and dedicated to the Virgin, St. James, St. Milburga of Much Wenlock in Shropshire (whence came the first monks) and St. Mirinus (St. Mirren), the patron-saint of Paisley, who is supposed to have been a contemporary of St. Columba. The monastery became an abbey in 1219, was destroyed by the English under Aymer de Valence, earl of Pembroke, in 1307, and rebuilt in the latter half of the 14th century, the Stuart kings endowing it lavishly. In 1553 Lord Claud Hamilton, then a boy of ten, was made abbot, and the abbacy and monastery were erected into a temporal lordship in his favour in 1587. The abbey lands, after passing from his son the earl of Abercorn to the earl of Angus and then to Lord Dundonald, were purchased in 1764 by the 8th earl of Abercorn, who let the ground for building purposes. The abbey church originally consisted of a nave, choir without aisles, and transepts. The nave and tower have been restored, and careful work has been done on the choir. The nave is used as the parish church. Robert III. was interred before the high altar of the choir in 1406. Over his grave a monument to the memory of the Royal House of Stuart was placed here by Queen Victoria (1888). In the south transept is St. Mirren's chapel (founded in 1499), with the tombs of abbot John Hamilton and of the children of the 1st lord Paisley, and the recumbent effigy of Marjory, daughter of Robert Bruce, who married Walter, the Steward, and was killed while hunting at Knock Hill between Renfrew and Paisley (1316).

About 3 m. S. of Paisley are the braes of Gleniffer, and 2½ m. S.E. stand the ruins of Crookston castle, which is at least as old as the 12th century.

The Romans settled in Paisley in A.D. 84, and built a fort called Vanduara to the west of the White Cart.

PAITA, a port of northern Peru, in the department of Piura. Population (estimate 1920) 5,000. Paita has one of the best natural harbours on the coast, and is the port of the departmental capital, Piura, with which it is connected by rail (58 m.). The town, built on a sandy hillside, is desolate in appearance. There are a few modern necessities such as electric lights, telephones, telegraph, hospital and schools and water supply from the Chira River. Though free from yellow fever, sanitary conditions in Paita have continued to be so bad that much of the town is now (1928) being rebuilt, water and sewer systems repaired, and the port permanently improved. The principal buildings include Customs House, Post, Telegraph and Cable Offices, a cotton-seed oil mill and a few branch export and import houses which control trade. Cotton constitutes ⅞ of total exports, other items including cattle, kid-skins, tobacco and Panama hats. (*See* PIURA.) Paita was a prosperous port in colonial times.

PAIUTE. This tribal designation is applied to two distinct divisions of Shoshonean Indians in the Great Basin, western United States. The true or Southern Paiute are close relatives of the Ute and inhabit south-western Utah, north-western Arizona and southern Nevada. They are virtually indistinguishable from the Chemehuevi of south-eastern California. The northern Paiute or Paviotso are separated from the southern by the Shoshone, inhabit north-western Nevada and south-eastern Oregon and are close relatives of the Mono of California and Bannock of Idaho. Their mode of life is an adaptation of a non-agricultural population of meagre culture to an arid environment.

PAJOU, AUGUSTIN (1730–1809), French sculptor, was born in Paris on Sept. 19, 1730. At eighteen he won the *Prix de Rome;* at thirty he exhibited his *Pluton tenant Cerbère enchâiné* (now in the Louvre). His portrait busts of Buffon and of Madame Du Barry (1773), and his statuette of Bossuet (all in the Louvre), are amongst his best works. When B. Poyet constructed the Fontaine des Innocents from the earlier edifice of P. Lescot (*see* GOUJON) Pajou provided a number of new figures for the work. Mention should also be made of his bust of Carlino Bertinazzi (1763) at the Comédie Française, and the monument of Marie Lesczinska, queen of Poland. Augustin Pajou died in Paris on May 8. 1809.

PAKHOI, a treaty port in the province of Kwangtung, South China (21° 29′ N. and 109° 7′ E.), situated on a small peninsula at the head of the Gulf of Tongking. The harbour is easily

accessible from the open sea, but has only one tide in 24 hours. The port was opened to foreign trade by the Chefoo Convention in 1877 and in the succeeding period a considerable traffic to and from Yunnan, Kweichow and Kwangsi converged on Pakhoi, and was carried by coolies and transport animals across the mountains which separate the port from the Si-kiang valley in the interior. Thus it developed as a "side-door" through which traffic could pass free from the trade exactions imposed along the Red River and Si-kiang routes into Yunnan. In 1889, however, Mengtsz was opened as a treaty port, followed by Wuchow in 1897, and Kwangchow-wan (French) as a free port in 1898. With the relaxation of trade restrictions, the Red River and Si-kiang were established as the natural trade routes into Yunnan. Consequently the commercial importance of Pakhoi declined and its trade sphere is now limited to its somewhat poor and sandy neighbourhood, between the coast and the mountains behind.

The total maritime customs revenue of the port in 1924 was Hk. Taels 159,607, showing an increase over recent years.

In 1924, the net foreign imports amounted to 2,895,298 Hk. Taels, and the net Chinese imports to 307,314, while exports were 1,819,189; total 5,021,801 Hk. Taels.

The interruption of the traffic with Hongkong in 1926 (owing to the boycott) led to a reduction by 50% of the total trade of Pakhoi. The population in 1926 was reckoned at 35,000.

PAKINGTON, the name of a famous English Worcestershire family, now represented by the barony of Hampton. Sir John Pakington (d. 1560) was a successful lawyer and a favourite at court, and Henry VIII. enriched him with estates, including that of Westwood in Worcestershire. His grandnephew and heir, Sir John Pakington (1549–1625), was another prominent courtier, Queen Elizabeth's "lusty Pakington," famous for his magnificence of living. His son John (1600–1624) was created a baronet in 1620. His son, Sir John, the second baronet (1620–1680), played an active part on the royalist side in the troubles of the Great Rebellion and the Commonwealth, and was taken prisoner at Worcester in 1651; Lady Dorothy, his wife (d. 1679), daughter of the lord keeper Thomas Coventry, was famous for her learning, and was long credited with the authorship of *The Whole Duty of Man* (1658), which has more recently been attributed to Richard Allestree (*q.v.*).

The baronetcy became extinct with the death of Sir John Pakington, the 8th baronet, in January 1830, but it was revived in 1846 for his maternal nephew and heir, John Somerset Pakington (1799–1880), whose name was originally Russell. In 1874 he was created Baron Hampton, and he died in London on the 9th of April 1880. From 1875 until his death Hampton was chief civil service commissioner. In 1906 his grandson Herbert Stuart (b. 1883) became 4th baron Hampton.

PAKKHTO: *see* PUSHTU LANGUAGE.

PAKOKKU, a district in the Magwe division of Burma, lying west of the Irrawaddy river and south-west of Mandalay, with the line of the Chin hills as a general boundary on the west. It has an area of 6,210 sq.m. and a population (1921) of 465,771. The part of the district along the Irrawaddy and Chindwin rivers is alluvial. Beyond this, however, the country rises gradually to the low Shinmadaung and Tangyi ridges, where it is very arid. To the westward there is a rapid drop to the well-watered valley of the Yaw river, and then a rise over broken, dry country before the valley of the Myit-tha river is reached. The principal products are millet, sesamum and sugar produced from toddy-palms in the riverain districts, which also grow rice, grain, peas and beans. Tobacco and vegetables are also produced in some quantity, and maize is grown largely for the sake of the husk, which is used for native cheroot-wrappers, under the name of *yawpet.* The Yenangyat oil-fields, which produce quantities of petroleum, are in the south of the district, and iron used to be worked in a small way. There are large areas of reserved forests in the west of the district where a good deal of teak is worked out. The cutch—a yellow dye obtained from a small tree in the drier parts of the Yaw country—is particularly esteemed. The heat in May and June is very great, rising considerably above 100° F in the shade.

The great majority of the population is Burmese, but in the Yaw valley there is a peculiar race called Taungthas, who claim to be quite distinct from both Burmese and Chins.

The headquarters town, Pakokku, stands on the right bank of the Irrawaddy, and has grown into importance since the British occupation. The population in 1921 was 19,507. It is the emporium of the trade of the Chindwin and Yaw river valleys.

Pakokku Hill Tracts, a district also in the Magwe division, lying to the west of the Pakokku district. It includes 3,100 sq.m. of the forest mountains of the Aeakan Yomas, inhabited by 28,799 people (1921), mainly Chins and allied hill tribes. It includes one of the highest peaks of the Aekan Yomas, Mt. Victoria (about 10,000 ft.). Headquarters village is Kanpeket. In the north lies the district of the Chin hills, including an administered area of 8,000 m. in addition to large unadministered tracts. Pop. (1921) 110,079 (administered areas). The headquarters town is Falam, and the whole district consists of a succession of forested ridges inhabited by Chins.

PAL, KRISTO DAS (1839–1884), Indian publicist, was born in Calcutta in 1839, of the Teli or oil-man's caste. In 1872, after twenty-two years of successful journalism, he was made a member of the Bengal legislative council, where his practical good sense and moderation were much appreciated by successive lieutenant-governors. His opposition, however, to the Calcutta Municipal Bill of 1876, which first recognized the elective system, was attributed to his prejudice in favour of the "classes" against the "masses." In 1878 he received the decoration of C.I.E. In 1883 he was appointed a member of the viceroy's legislative council. He died on July 24, 1884.

See N. N. Ghose, *Kristo Das Pal, a Study* (Calcutta, 1887).

PALACE, strictly, the residence of a sovereign or ruler; hence applied to any exceptionally large and lavish house, and also, in some cases to official buildings, as the French palais de justice. (*See* GOVERNMENT AND PUBLIC BUILDINGS; CASTLE; HOUSE; and similar articles.)

PALACIO VALDÉS, ARMANDO (1853–), Spanish novelist and critic. His early writings, pungent essays remarkable for independent judgment and refined humour, were printed in the *Revista Europea.* His first novel, *El Señorito Octavio* (1881), showed an uncommon power of observation and in *Marta y María* (1883), a portrayal of the struggle between religious vocation and earthly passion, somewhat in the manner of Valera, Palacio Valdés achieved a very popular triumph which placed him in the first rank of contemporary Spanish novelists. He followed this up by *El Idilio de un enfermo* (1883), a most interesting fragment of autobiography and by *José* (1885), a realistic picture of the manners and customs of seafaring folk, containing passages of animated description barely inferior to the finest penned by Pereda himself. The emotional imagination of the writer expressed itself anew in the charming story *Riverita* (1886), one of whose attractive characters develops into the heroine of *Maximina* (1887); and from *Maximina,* in its turn, is taken the novice who figures as a professed nun among the personages of *La Hermana San Sulpicio* (1889), in which the love-passages between Zeferino Sanjurjo and Gloria Bermúdez are set off with elaborate, romantic descriptions of Seville. *El Cuarto poder* (1888) is, as its name implies, concerned with the details, not always edifying, of journalistic life. *La Espuma* (1890) and *La Fe* (1892), were enthusiastically praised in foreign countries, but in Spain their reception was cold. Subsequently Palacio Valdés returned to his earlier and better manner in *Los Majos de Cádiz* (1896), in *La Alegria del Capitán Ribot* (1889) and in *La Aldea Perdida* (1903). In these novels, and still more in *Tristán, ó el pesimismo* (1906), he frees himself from the reproach of undue submission to French influences. His later works, *Papeles del Doctor Angélico* (1911), *La Novela de un Novelista* (1921) and *La Hija de Natalia* (1923) preserve much of the charm, if not the freshness, of his earlier novels; in any case Palacio Valdés takes a prominent place in modern Spanish literature as a keen analyst of emotion and a sympathetic, delicate, humorous observer. (J. F.-K.)

PALACKÝ, FRANTISEK [FRANCIS] (1798–1876), Czech historian and politician, was born on June 14, 1798, at Hodslavice (Hotzendorf) in Moravia, of a Protestant family. After some

years spent in private teaching Palacký settled in 1823 at Prague. Here he found a warm friend in Dobrovský, whose good relations with the Austrian authorities shielded him from the hostility shown by the government to students of Slav subjects. Dobrovský introduced him to Count Sternberg and his brother Francis, both of whom took an enthusiastic interest in Bohemian history. Count Francis was the principal founder of the Society of the Bohemian Museum, devoted to the collection of documents bearing on Bohemian history, with the object of reawakening national sentiment by the study of the national records. Public interest in the movement was stimulated in 1825 by the new *Journal of the Bohemian Museum* (*Casopis českého Musea*) of which Palacký was the first editor. The journal was at first published in Czech and German, and the Czech edition survived to become the most important literary organ of Bohemia.

Palacký had received a modest appointment as archivist to Count Sternberg and in 1829 the Bohemian estates sought to confer on him the title of historiographer of Bohemia, with a small salary, but it was ten years before the consent of the Viennese authorities was obtained. Meanwhile the estates, with the tardy assent of Vienna, had undertaken to pay the expenses of publishing Palacký's capital work, *The History of the Bohemian People* (5 vols., 1836–67). This book, which comes down to the year 1526 and the extinction of Czech independence, was founded on laborious research in the local archives of Bohemia and in the libraries of the chief cities of Europe, and remains a standard authority. The first volume was printed in German in 1836, and subsequently translated into Czech. The publication of the work was hindered by the police-censorship, which was especially active in criticizing his account of the Hussite movement.

In 1848 Palacký was deputed to the Reichstag which sat at Kroměříce (Kremsier) in the autumn of that year, and was a member of the Slav congress at Prague. He refused to take part in the preliminary parliament consisting of 500 former deputies to the diet, which met at Frankfort, on the ground that as a Czech he had no interest in German affairs. He was at this time in favour of a strong Austrian empire, which should consist of a federation of the southern German and the Slav states, allowing of the retention of their individual rights. These views met with some degree of consideration at Vienna, and Palacký was even offered a portfolio in the Pillersdorf cabinet. The collapse of the federal idea and the definite triumph of the party of reaction in 1852 led to his retirement from politics. After the liberal concessions of 1860 and 1861, however, he became a life member of the Austrian senate. His views met with small support from the assembly, and with the exception of a short period after the decree of September 1871, by which the emperor raised hopes for Bohemian self-government, he ceased to appear in the senate from 1861 onwards.

In the Bohemian Landtag he became the acknowledged leader of the nationalist-federal party. He sought the establishment of a Czech kingdom which should include Bohemia, Moravia and Silesia, and in his zeal for Czech autonomy he even entered into an alliance with the Conservative nobility and with the extreme Catholics. He attended the Panslavist congress at Moscow in 1867. He died at Prague on May 26, 1876.

Among his more important smaller historical works are: *Würdigung der alten böhmischen Geschichtschreiber* (Prague, 1830), dealing with authors many of whose works were then inaccessible to Czech students; *Archiv česky* (6 vols., Prague, 1840–72); *Urkundliche Beiträge zur Geschichte des Hussitenkriegs* (2 vols., Prague, 1872–74); *Documenta magistri Johannis Hus vitam, doctrinam, causam . . . illustrantia* (Prague, 1869). With Safarik he wrote *Anfänge der böhmischen Dichtkunst* (Pressburg, 1818) and *Die ältesten Denkmäler der böhmischen Sprache* (Prague, 1840). Three volumes of his Czech articles and essays were published as *Radhost* (3 vols., Prague, 1871–73). For accounts of Palacký *see* an article by Saint René Taillandier in the *Revue des deux mondes* (April, 1855); Count Lützow, *Lectures on the Historians of Bohemia* (London, 1905).

PALAEO-ASIATIC LANGUAGES. The languages described as "Palaeo-Asiatic" are spoken in the extreme north-east of Siberia; Yukaghir, Chukchee, Koryak, Kamchatkan, and Gilyak. They contain features characteristic of many American languages. The phonetic system is rich and is marked by a scheme of vocalic harmony by which the three classes of vowels, weak, strong, and neutral, are duly regulated. In ordinary conversation the women do not use the pronunciation of the men. The grammatical processes are numerous. Koryak has a dual and the relation between subject and predicate is conceived differently in transitive and intransitive verbs. Prefixes and suffixes are numerous. number, location, size being thus indicated. The numbers are derived from manual concepts; five being a hand and 20 being a man. Higher numbers are composed with the word for man, and numbers higher than 400 are called "limit of knowledge." Chukchee and Koryak have borrowed some words from Russian but possess the power to form new words for new ideas. Kamchatkan has been much modified by Russian.

BIBLIOGRAPHY.—*Bureau of American Ethnology, Bulletin 40*, pt. 2, 1922.

PALAEOBOTANY or **VEGETABLE PALAEONTOLOGY,** a branch of the science of botany, is concerned with the study of plants which lived in past ages, by means of their remains found as fossils in the rocks. Fossil plants may be regarded as the documents on which the history of the plant-world is founded. A surprising amount is known about the form of fossil plants from rocks as ancient as those of the Ordovician (*see* GEOLOGY), and, according to the latest estimates of geological time, about 500,000,000 years have since elapsed. During that time the constitution of the flora of the earth has been changing continuously. Starting with the fossils found in the older sedimentary rocks and reviewing those of successively later formations, it becomes apparent that each species, genus, or larger systematic grouping has three phases in its history: its first appearance and development, its period of maximum abundance, and its dying out and final extinction. As one would expect, the fossils found in the more recently formed rocks are most like the plants living at the present day. While on the one hand the evolution of some families of plants appears to be an exceedingly slow process, for even as far back as the Ordovician there are found algae very similar in form to some of the living ones, there are on the other hand examples illustrating comparatively rapid evolution. Although the Angiosperms (plants with flowers) appear late in geological time they have already become the dominant plants of to-day. A reference to the diagram below will show that there is evidence that the more highly specialised groups such as the Cycadales, Bennettitales and Angiosperms have been evolved later than the comparatively simple types represented by the Algae and

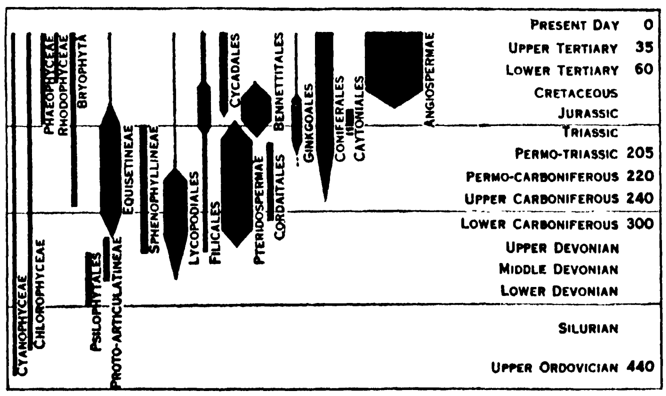

DIAGRAM REPRESENTING DURATION AND RELATIVE ABUNDANCE OF THE VARIOUS GROUPS OF PLANTS AT DIFFERENT GEOLOGICAL PERIODS, WITH THE AGES IN MILLIONS OF YEARS CALCULATED FROM RADIO-ACTIVE MINERALS

Bryophyta and that simplicity in structure is in general an index of primitiveness. This agrees in a general way with the theory that the more specialised and complex plants have been evolved from simpler forerunners. It must be remembered, however, that although Lycopods, Cycads and Ginkgoales are represented in the present day flora the chances are that an investigator at a future period would find no trace of them among the fossil debris of the present age since they form such a small part of the vegetation. There is no reason to believe that the present day flora of the world has attained a permanent constitution; on the contrary, it

is probably changing as rapidly, if not more rapidly, than at any part of its developmental history.

Earliest Land Plants.—About the close of the Silurian period and the beginning of the Devonian, land-plants appear for the first time; and all plant-fossils found in earlier rocks than these have so far proved to be Algae. It has been suggested that land-plants may have arisen from sea-weed ancestors which became established on the land and in the process of migration underwent considerable changes—a theory which is not disproved by the fossil-evidence. By the Upper Devonian period land-plants were in existence which in complexity of organization were little inferior to the plants of to-day; there were forests of tall trees, so that then the face of the earth with its mountains and forests must have appeared much as it does now. It is from fossil-plants that information has been gained of the enormous fluctuations in climate and changes in the distribution of land and sea that have succeeded one another in the history of the earth's surface. It is a striking fact that rich, perhaps tropical, floras are found in the rocks of countries now in the frigid grip of polar conditions, *e.g.*, Greenland and Spitsbergen. In the latter country the fact that coal is found in large quantities in Devonian, Carboniferous, Jurassic and Tertiary rocks, is clear proof of vigorous vegetation in lands which at the present moment have a scanty mantle of small herbs in their more favoured valleys.

Conditions of Fossilization.—Before the history of the various groups of the Plant World is considered the nature of plant-fossils and the technique of palaeobotanical investigation may be briefly explained. Fossil-plants are to be found in two forms, incrustations and petrifactions. The incrustations are the commonest type found and have been formed by plant-fragments becoming embedded in the mud or silt of a lake or estuary. As the sediment was changed in the course of ages into shale or sandstone rocks the plants became compressed by the vertical stress of the overlying sediment and are finally found, when the rock is split open, in the form of a thin layer of black carbonaceous matter which gives silhouettes of the plants. In many fossils this carbonaceous matter is similar to coal (*q.v.*) in composition and retains to a varying extent the outward form of the plant (Plate I., fig. 7) while the internal structure has mostly disappeared. It is possible to remove such a fossil from the rock and then the film may be translucent and some structure visible (Plate I., fig. 6). It may happen that in an incrustation the original cuticle of the plant and sometimes the spores are preserved and may be isolated by chemical treatment. The petrifaction is the most valuable type of fossil for investigation of the internal structure but is comparatively rare. In the petrifaction the entire plant fragment has been converted into solid rock, mainly by a gradual substitution of mineral matter for the water which forms such a large proportion of most plant tissues, before the plant was subjected to any considerable pressure by the sand and mud subsequently deposited over it. The mineral substances reach the plant by a process of diffusion from the water contained in the sediment in which the plant is embedded. The most perfectly preserved plants are those petrified in silica. The Middle Devonian chert found in Aberdeenshire contains embedded in its siliceous matrix fossil-plants in which every cell-wall is so clearly defined (Plate I., fig. 2) that the knowledge of their internal structure is practically complete. The beds of silica of Permian age at Autun in France have also furnished some very perfectly preserved plants. Silicified wood is common in many geological formations and a considerable number of silicified Mesozoic plants is known.

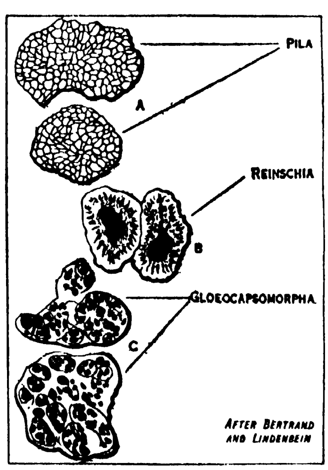
Concretionary masses known as "coal-balls" or "bullions" are found embedded in the coal of certain seams in Lancashire and Yorkshire, sometimes in such abundance that further working of the seam is unprofitable. These coal-balls consist largely of calcium and magnesium carbonates and contain well preserved plant fragments; they represent part of the vegetable matter of the seam which became petrified before the rest became compressed to form the coal. Similar concretions are found in the Belgian, Dutch, Westphalian and Silesian coal-fields. It is from the study of the plants in the coal-balls from Lancashire and Yorkshire that Binney, Williamson and recently Scott, have been able to reveal so much about the structure of fossil-plants of the Carboniferous period. The coal-ball or other petrified mass may be cut into thin slices which are ground so thin and translucent that the cellular structure of the contained plants is made visible when viewed by transmitted light.

Form Genera.—Specimens of fossil-plants which are sufficiently complete to show the connection between the different parts of the same plant, for example between the leaves and stem or the cones and stem, are very rare. It is therefore usually convenient to constitute form-genera to include the corresponding parts of a group of closely allied species. Thus in the genus of fossil-trees *Lepidodendron* the stems are included in the form-genus *Lepidodendron*, detached leaves in *Lepidophyllum* and the cones in *Lepidostrobus*, while the root-bearing parts which are indistinguishable from those of an allied genus *Sigillaria* are grouped with those of the latter genus in the form-genus *Stigmaria*.

PLANTS OF THE PALAEOZOIC PERIOD

In this great division of Geological time the oldest rocks which contain evidence of contemporary plant life were laid down. The various groups of plants present in the Palaeozoic will be treated in systematic order while the distribution and succession of the floras will be briefly dealt with at the end of this section. The Glossopteris or Southern type of Carboniferous and Permian flora will be considered in the section on the Mesozoic Period.

Thallophyta. *Algae* (Seaweeds, etc.).—As a class the Algae are difficult subjects to investigate in the form of fossils. Except in the case of a few of the groups of this large division of the plant kingdom the plant body is soft, consisting of a very large proportion of water, and therefore offering a very small amount of solid matter for the making of a fossil. In external form so many Algae are alike; they are often undifferentiated into stem and leaves, *i.e.*, thalloid, and unless there is information available about their method of reproduction external form alone is of little value in determining their systematic position. A great many supposed fossil-algae have been described and named but it can often only be said about them that the outline of the mark they make on the rock suggests the outline of the frond of a sea-weed. If none of the carbonaceous constituent of the plant is left and no cellular structure preserved such a fossil is of no scientific value. Some purely physical causes such as the flow of a small trickle of water over a mud surface can produce shapes like branching fronds and it has been shown fairly conclusively that certain marks which at one time were supposed to represent Algae in some early rocks are no more or less than the tracks of worms or some other animals in the mud which was finally consolidated to form the rock. Where organic residue is present and there is evidence that the structure is really of vegetable origin further information cannot be got without cellular structure as a guide as there are other plants beside algae which have a thalloid form, *e.g.*, some Liverworts.



FROM (A, B) BULLETIN DE LA SOCIETE BELGE DE GÉOLOGIE, (C) BULLETIN DE LA SOCIÉTÉ BOTANIQUE DE GENÈVE

FIG. 1.—SOME ALGAL CONSTITUENTS OF COAL AND BITUMINOUS SHALES

The *Schizophyceae* were present in all probability as early as the Cambrian. *Marpolia spissa*, one of several thalloid and filamentous types found in Middle Cambrian rocks in British Columbia shows structure which indicates that what appear to be branching filaments are really compound, consisting of several cellular filaments united in a sheath. The cells of the filaments are exceedingly small. These features are also exhibited by the living genus *Schizothrix* of the Schizophyceae. *Archaeothrix oscillatori-*

formis discovered by Kidston and Lang in the Middle Devonian chert of Aberdeenshire is an Alga consisting of cellular filaments which are so like those of some living Schizophyceae that there is no doubt of its systematic position in that group. *Pachytheca,* a small spherical algal colony built up of filaments of a similar type is a characteristic fossil of the Silurian and Devonian and appears to be related to the Schizophyceae.

The *Chlorophyceae* (Green Algae) are not certainly known as fossils but it seems probable that they may have existed in the Palaeozoic. A considerable deposit of a combustible material is known in Silurian rocks to the east of the Baltic. This deposit (Kuckersite) consists of a fossil-alga *Gloeocapsomorpha* (fig. 1 C). The affinities of this plant are doubtful but it may well be a green Alga. It has been shown that many bituminous shales and cannel coals are mainly formed of a deposit of small algal colonies. *Pila* and *Reinschia* (fig. 1, A and B) form the main algal constituent of many shales and coals of Carboniferous and Permian age. The building up of combustible deposits of a similar nature is taking place at the present day: a green alga, *Botryococcus coorongiana,* almost identical in the form of its cell-colonies with *Reinschia,* forms masses of tough bituminous matter on the shores of certain South Australian lagoons. While alive these algae store up oil in their cells and it is this oil which on the death of the organism permeates the whole mass and gives the bituminous properties to this "coorongite" and presumably also to the fossil deposits built up of algae with a similar cellular structure such as *Reinschia.* The existing families of the Codiaceae and Dasycladaceae are represented as far back as the Ordovician and provide us with the longest and perhaps most complete historical record of any living group of plants. In several of the genera of both families a thick calcareous deposit accumulates on the outside of the cell-wall and it is in virtue of this deposit that they have been preserved and that some are important constitutents of limestones formed during various geological periods. *Dimorphosiphon, Palaeoporella* and *Cyclocrinus* are some of the Ordovician genera. *Dimorphosiphon* is remarkably like the living genus *Codium* but differs in having a secretion of lime on its surface.

Charophyta (Stoneworts).—There is evidence of the presence of plants allied to the stoneworts in the Devonian; *Palaeonitella,* from the Aberdeenshire chert, with its whorled branch segments, is very like a small *Nitella.*

Fungi (Moulds, etc.).—Abundant remains of fungal filaments and resting spores have been found in the Aberdeenshire chert and establish the presence of Phycomycetous fungi in the Middle Devonian. Some of the filaments have numerous septations which as Kidston and Lang have suggested may indicate the presence of higher fungi (*Eumycetes*) as well. There are several records of Phycomycetes from the Carboniferous and Permian while F. E. Weiss has demonstrated the presence, in a coal-ball, of roots belonging to some gymnosperm infected with fungal hyphae. The distribution of the fungus in the tissues suggests that here is an example of the symbiotic relationship of fungus to higher plants which is known as mycorrhiza.

Bacteria.—A number of supposed fossil bacteria have been described from Palaeozoic rocks but they are of practically no scientific value. It is however practically certain that bacteria existed because petrified plant remains are found which show clear evidence of decay and no traces of fungi are visible.

Thallophyta of Uncertain Systematic Position. Nematophyton. In the Silurian and Devonian, in several parts of the world, fragments of a large plant are found the whole bulk of which was built up of loosely packed tubes, the larger running parallel to the axis while finer ones are found forming an inter-lacing system between them. In one specimen in which the outer surface is preserved there is a narrow zone where the tubes turn outwards and meet the surface at right angles. This type of construction is typically algal but the size of the fossils, some of which reach a thickness of three feet, show that they are quite unlike any living alga. In *Sporocarpon* from the Upper Devonian of America only the tips of the branches of what must have been a thalloid plant have been found. These tips are forked and rows of isolated tetrads of spores are found embedded in the tissue in each branch. The resistant nature of the spores suggests that they may have been cutinised like those of the Pteridophyta. Cutinised spores are also found in the lower Devonian plant *Parka,* the "puddock spawn" of the Forfarshire quarrymen, which consists of small circular thalli with small rounded masses of spores embedded in them.

Bryophyta.—Mosses and liverworts are found in almost every type of vegetation at the present day and it is surprising that they are so rare in the fossil state. On structural grounds they must be considered a relatively primitive and simple type of plant. Several fossil liverworts are known from the Upper Carboniferous of England. *Hepaticites Kidstoni* is a very small plant (fig. 2, B) with two parallel rows of leaves one on either side of a relatively stout axis and two rows of smaller scale-like leaves along the surface of the axis. In *H. Willsii* (fig. 2, A) and *H. Langii* the plant is thalloid consisting of a ribbon-shaped body which forked repeatedly. In *H. metzgerioides* a strand of conducting cells is present along the middle of the thalloid body of the plant. All these liverworts appear to be most closely related to the anacrogynous liverworts and compare very closely with some of the living ones in their vegetative structure. There is no evidence of the presence of acrogynous liverworts. Small shoots have spirally arranged leaves preserved as incrustations. *Muscites polytrichaceus,* and a very small petrified stem, which has absorptive hairs with oblique cross walls, *M. Bertrandi,* have been found in Upper Carboniferous rocks in France, demonstrating fairly conclusively the existence of mosses at that period.

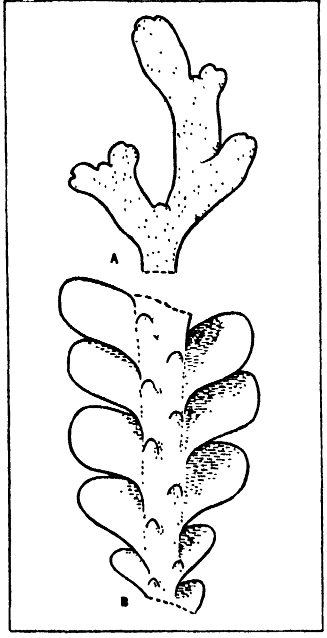


FIG. 2.—CARBONIFEROUS LIVERWORTS
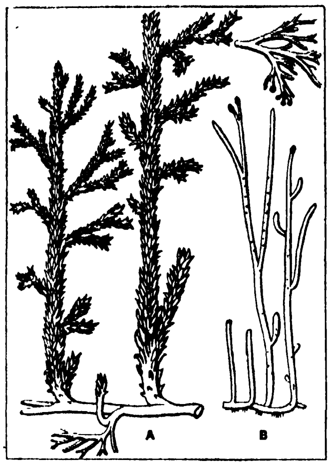
A. Thallose type. B. Leafy type

Pteridophyta. *Psilophytales.*—Among the several very incompletely known plants of the Lower Devonian, *Psilophyton princeps* may be cited as representing one of an important group of plants which have certain primitive attributes. The name was given to some specimens from Canada by Sir J. W. Dawson more than half a century ago. Owing to the discovery of large masses of silica containing petrified plants in beds of Middle Devonian age in Aberdeenshire Kidston and Lang have been able to reconstruct, almost in their entirety, some plants which are closely related to Dawson's *Psilophyton princeps.* The plants are found petrified in their position of growth and five species grouped in three genera have been distinguished which with *Psilophyton* constitute the Psilophytales. One of them, *Rhynia Gwynne-Vaughani* (fig. 3, B) a small plant with cylindrical shoots, about 8 in. in height, is remarkable for having no leaves or roots. The lower parts of the shoots were horizontal and were furnished with small tufts of absorptive hairs on the under surface; while the presence of stomata on the vertical parts bears witness to their having been aerial and green. Another species, *Rhynia major,* was a slightly larger plant but both species of *Rhynia* must have been much alike in appearance. Sporangia are found on the tips of some of the aerial branches containing numerous spores (Pl. I., fig. 2) which were produced in tetrads as in other Pteridophyta. The internal structure of the shoot is simple (Pl. I., fig. 1); a single strand of xylem (wood) in the centre surrounded by a sheath of phloem (bast) constituted the vascular cylinder or stele. The cortex is wide in relation to the vascular tissue and consists of an inner zone of thin walled cells with large intercellular air spaces and an outer zone, two or three layers deep, of large cells which are elongated at right angles to the surface. The epidermis con-

sists of a single layer of smaller, slightly thicker-walled cells and had a well developed cuticle. The stomata are infrequent and each consists of two simple guard cells surrounding a pore. Small adventitious branches are found attached to some of the shoots and as there is no vascular connection between the adventitious branch and the shoot it is probable that these branches were easily detached and served to propagate the plant vegetatively.



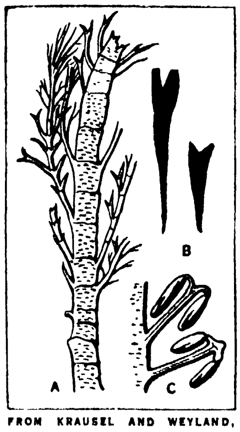
AFTER KIDSTON AND LANG

FIG. 3.—ANCIENT TYPES OF LAND-PLANT FROM THE DEVONIAN OF SCOTLAND. A. ASTEROXYLON. B. RHYNIA

Hornea Lignieri, a plant of similar dimensions and habit, has tuberous swellings at the base of the shoots. The differentiation of vascular tissue, which forms a cylindrical strand in the stem, only extends for a short distance into the swollen base, whose under surface bore absorptive hairs. The sporangia differ from those of *Rhynia* in having a sterile column of tissue extending from the base up into the midst of the sporangium. This column has been compared with the columella found in the capsules of the Liverworts and Mosses. In both *Rhynia* and *Hornea* the sporangia look something like swollen branch-tips and in *Hornea* branched sporangia are known.

Asteroxylon Mackei (fig. 3, A) a more complex plant, had smooth horizontal stems with small root-like branches; true roots are absent just as in *Rhynia* and *Hornea;* the aerial shoots are erect and densely clothed with small scale-like leaves. The stele contains a fluted column of xylem which appears in section like a multi-rayed star. Small strands of tracheids connected with the stele pass out towards each leaf but stop short before entering the base of the leaf which had no vascular tissue. In *Thursophyton* a probably closely allied plant from the Middle Devonian the leaves are small and spine-like and vary considerably in size. These facts suggest that in plants of the small-leaved type such as the lycopods the leaves may be the homologues of spines or in other words the small leaf of the lycopod may have evolved from a small spine or emergence of the shoot by a gradual process of vascularisation, an early stage in the process being represented by the condition found in *Asteroxylon* where the vascularisation has not yet extended from the shoot into the leaf itself. The sporangia of *Asteroxylon* were borne, in all probability, on small smooth branches. Another species of *Asteroxylon* has been found in Germany which has leafless upper branches, comparing therefore with the supposed fertile branches of the Scottish plant. Nothing is known about the sexual generation of these Devonian plants. A consideration of the Psilophytales as a group suggests that they may represent, in the *Asteroxylon-type* with its small leaves, the fore-runners of the Lycopods. The branching shoot of *Rhynia* with its terminal sporangia suggests that the large megaphyllous fern frond with sporangia on its edges may have originated from such a branching shoot. The column of tissue in the sporangium of *Hornea* suggests comparison with the columella of the moss or liverwort. The living group, the Psilotales, which compare with *Rhynia* in being rootless and sometimes almost leafless but which differ considerably in the position of the sporangia on the plant, may also be related. Finally, in the absence of differentiation into stem and leaves, the plant body of *Rhynia* with its simple thalloid form calls attention to the suggestion put forward by more than one writer that land-plants are descended from algal ancestors. It has been remarked that the sporangia in the vascular plants correspond morphologically to the branches of the algal thallus which bear the reproductive organs (*e.g.,* the stichidia in the red sea-weeds). This is interesting in view of the resemblance between sporangia and branch tips already referred to in *Hornea* and to the structure of the fertile branches in *Sporocarpon* the Upper Devonian thallophyte in which the tips bear isolated tetrads of spores. There was clearly in Devonian times a group of plants in existence in which there was a combination of thallophyte and pteridophyte characters and, as Kidston and Lang point out, "the facts are . . . consistent with the Rhyniaceae finding their place near the beginning of a current of change from an Alga-like type of plant to the type of the simpler Vascular Cryptogams."

Articulatales.—This large group of the Pteridophyta includes the Proto-articulatineae, Sphenophyllineae, and the Equisetineae.



FROM KRAUSEL AND WEYLAND, "DEVONFLORA" (SENCKENBERGISCHE NATURFORSCHENDE GESELLSCHAFT)

FIG. 4.—ARTICULATE PLANT OF MIDDLE DEVONIAN AGE (CALAMOPHYTON PRIMAEVUM)
A. Small branch. B. Leaves. C. Two sporangiophores; each with two sporangia

The first is represented in the Middle Devonian of Germany by *Calamophyton primaevum* (fig. 4) a plant recently described by Kraüsel and Weyland. The stems are jointed and have small bifid leaves attached at the nodes. The sporangia are borne in pairs on modified leaves which compare closely therefore with the sporangiophores of the Equisetineae. *Hyenia* of the same age has small deeply cleft leaves and in vegetative features resemble the Sphenophyllineae. The fertile leaves are forked and two or three sporangia are borne on the ends of each division.

Sphenophyllineae. — *Sphenophyllum,* a genus common in the Carboniferous, ranges from the Upper Devonian to the Triassic. The plant grew in the form of a slender shrub which may have supported its branches by scrambling over other plants. The stems are jointed with whorls of small wedge-shaped leaves, which are often deeply dissected (Pl. I., fig. 8). The leaves of one whorl lie immediately above those of the whorl below and are usually in multiples of three. This arrangement is related to the structure of the stele which is triangular in section and has a central column of xylem; at the nodes two vascular strands pass out from each corner to supply the leaves. The stems and roots have a considerable amount of secondary vascular tissue. While not much variation is shown in the vegetative parts of the known species of *Sphenophyllum* there is considerable variety in their cones. In *Sphenophyllum Dawsoni* the cones are several inches long and at least half an inch thick. They are built up of whorls of leaf-like bracts and those of each whorl are coherent laterally for half their length from the base so that each whorl forms a cup (fig. 5). The whorls of bracts overlap so that the cone is covered on the outside by their overlapping tips. The sporangia are twice as numerous as the bracts and are attached by narrow stalks (sporangiophores) to the upper surface of the sheath of bracts close to the axis of the cone. The sporangiophores are not all of the same length so that the sporangia had the appearance of being arranged in more than one whorl in each cup. In *Bowmanites* a cone belonging to some closely related plant, the sporangiophores had a bract-like expansion at the end and each bore two sporangia. This arrangement suggests that bracts and sporangiophores may be equivalent structures and that the cone of *Sphenophyllum* may be regarded as being built up of a series of bi-lobed leaves, the ventral lobes being fertile while the dorsal assumed the form of subtending bracts. In *S. fertile* this theory receives support as dorsal and ventral lobes reveal their equivalence by both being fertile. In other species there are no distinct terminal cones; nodes with fertile leaves alternate with nodes

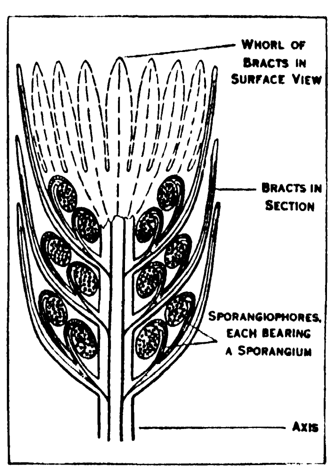


FIG. 5.—SPHENOPHYLLUM DAWSONI
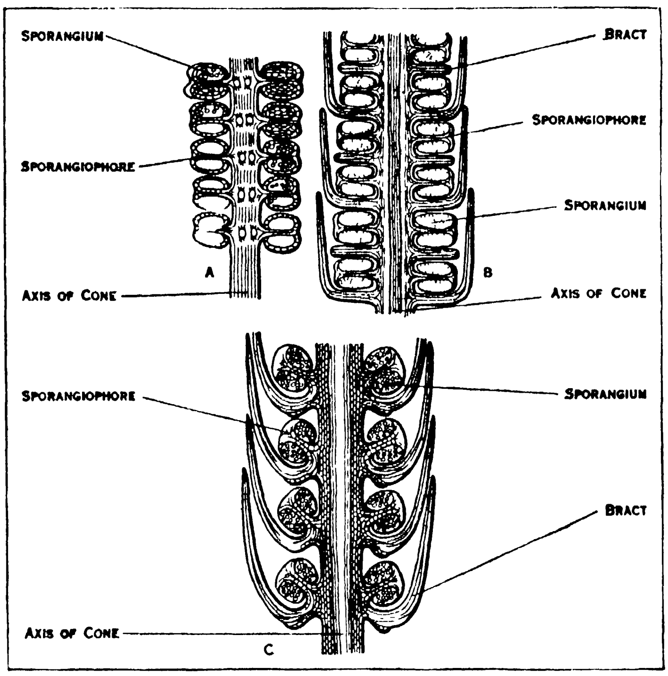
Diagram showing longitudinal section of the cone

bearing sterile leaves. This hypothetical bi-lobed leaf may also be distinguished in *Cheirostrobus,* a very complicated cone of Lower Carboniferous age Here the leaf is divided into three dorsal sterile and three ventral fertile segments. Each fertile segment bears four sporangia and in construction is exceedingly like the sporangiophore of the Equisetineae and it is possible that *Cheirostrobus* is a representative of the stock from which the Sphenophyllineae and Equisetineae have both sprung.

Equisetineae —The fossil Equisetineae were at their zenith in Carboniferous times; in place of the small, herbaceous *Equisetum* (horse-tail) of to-day there were gigantic trees some with a girth of three metres and a height of 60 metres forming a conspicuous feature in some aspects of the vegetation. *Calamites* the best known genus had the same habit as the horse-tail with jointed stem and small leaves but differed in its much greater size. The internal structure of the stems, roots and leaves, is in many respects like that of *Equisetum* only there is secondary thickening in the stems and roots. The leaves, usually small, linear or lance-shaped, are often united near the base to form a sheath round the stem. Like *Equisetum* the stems are hollow with a large central cavity. Casts of these cavities in sandstone are frequently found showing longitudinal grooves representing the courses of the primary woody strands which projected into the pith cavity There is a constriction on the cast at each node and the grooves of one internode alternate with those on the internode above and below. Two main types of calamite-foliage are known: *Asterophyllites* and *Annularia;* in the former the leaves are long and awl-shaped and quite separate In *Annularia* the leaves are usually more paddle-shaped terminating in a small sharp point. The single vein which passes out into this point had, in some species, a swelling near the tip of the leaf suggesting the presence of a water gland In another type of *Annularia* the margins of the leaf were inrolled and bore a fringe of hairs which probably sheltered the stomatal surface of the leaf. The cones exhibit a considerable range in form, indicating that several families and genera may be



(A AND B) FROM RENAULT, "BASSIN HOUILLER ET PERMIEN D AUTIEN ET D ERPINAC," BY COURTESY OF THE MINISTER OF PUBLIC WORKS (FRANCE)

FIG 6 —EQUISETALEAN CONES, SHOWING LONGITUDINAL SECTIONS OF (A) ARCHAEOCALAMITES, (B) PALAEOSTACHYA, (C) CALAMOSTACHYS

included in *Calamites.* In *Calamostachys* the cones were terminal on the branches and the axis of the cone bore whorls of peltate sporangiophores similar to those of *Equisetum* but alternating with whorls of sterile bracts (fig 6, C). The sporangiophores are in superposed whorls while the bracts of one whorl alternate with those above and below. Each sporangiophore bears four sporangia in which the spores are found sometimes arranged in tetrads. In some species the spores in the cone are all of the same size but other species are heterosporous some sporangia having large numbers of small spores while others in the same cone had a smaller number of large spores. In *Palaeostachya* (fig. 6, B) the sporangiophores unlike those of *Calamostachys* are attached in the axile of the bracts which subtend them. In *Archaeocalamites,* a characteristically Lower Carboniferous plant, the leaves are long and may be twice forked while the vascular strands of the inter-

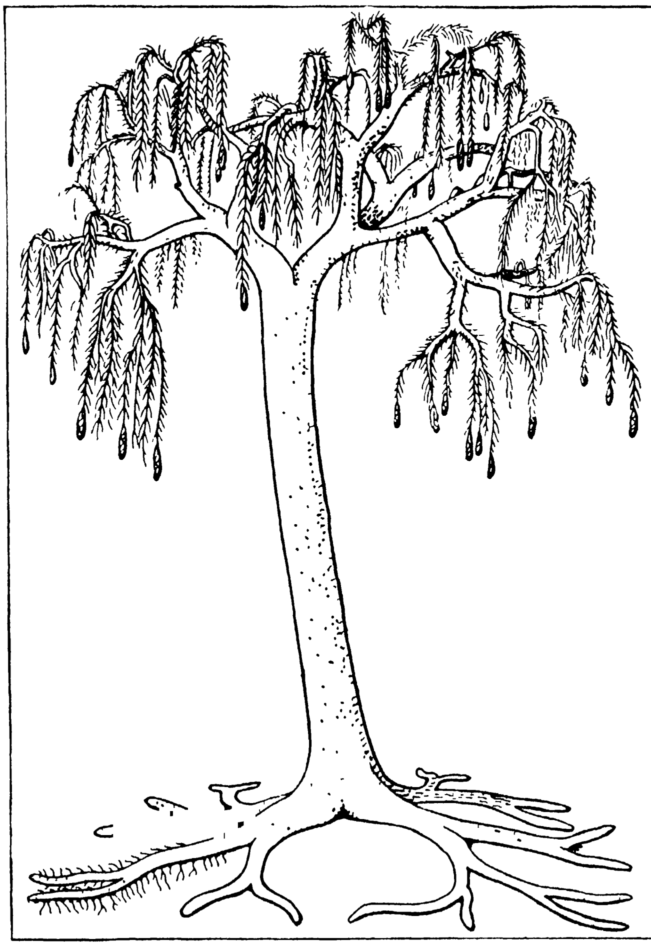


FIG 7 —RECONSTRUCTION OF A LEPIDODENDRON, SHOWING THE STIMARIAN BASE, TRUNK, LEAVES AND CONES

nodes pass straight through and do not alternate at the nodes The cones (fig 6, A) are very like those of *Equisetum* but are long and constricted at intervals where forked leaves were attached so that they resemble a branch in which the internodes are covered with sporangiophores Although the presence of heterospory and secondary thickening are probably stages in the direction of a gymnospermous type the Equisetineae must be considered as essentially Pteridophyta

Lycopodiales (Club-Moss allies)—The lycopods are typically small-leaved plants There are three living genera· *Selaginella, Isoëtes* and *Lycopodium,* interesting in view of their relation to the Palaeozoic members of the group: the first two are ligulate and the second has secondary thickening in its rootstock in these respects comparing with the majority of the fossils The living forms must be regarded as the remnant of a once important group; they are all herbs, whereas the fossils were almost all trees

(*a*) Ligulateae *Lepidodendron* (fig 7) which may be taken as the type of the group is of extended geological range; while *Protolepidodendron,* a very doubtfully related plant, is of Middle Devonian age *Lepidodendron* itself ranges from the Upper Devonian to the Permian The trunk reached a height of over 114 ft. while above that the crown of forking branches rose for a further 20 ft The lance-shaped leaves are usually from one to four inches in length but sometimes reached the length of a yard; they were shed when the part of the plant bearing them reached a certain age leaving a scar on the persistent leaf-base (Pl. I, figs

7 and 8). The ligule, a small secretory scale, is situated in a pit on the leaf-base just above the point of attachment of the leaf. The leaf-bases are diamond-shaped in outline and are very regularly arranged on the surface of the stem. The leaves have a single median vein and the ventilating tissue of the leaf was connected with that of the stem by two strips of a similar tissue termed parichnos which have left the two small marks one on each side of the vascular strand on the leaf-scar (fig. 8). There were deciduous side branches arranged in two vertical rows on each side of the trunk or main branches: when these became detached they left a characteristic scar. In other species there were numerous vertical rows of these deciduous branches and while it is possible that these branches may have borne the cones in yet other species the cones are known to have been placed on the ends of the ordinary foliage twigs (fig. 7). The stems and branches were traversed by a cylindrical column of primary xylem, in some species solid, but in others with a parenchymatous core. The protoxylems are situated on the outer surface of this column and from them the small vascular strands to the leaves passed out through the external tissues. In most species secondary wood was formed round the primary. External to the wood was a tissue corresponding to the phloem surrounded by the inner and outer cortex, the former a lacunar, ventilating tissue, while the latter had a cambial zone near its outer limit which gave rise to corky tissue. A thin layer of the cortex outside the corky tissue afforded a foundation for the attachment of the persistent leaf-bases and became fissured later by the expansion due to the secondary growth within. The cones were in general construction like those of *Selaginella* only much larger and as in the living genus each sporophyll bore a ligule on its upper surface close to the abaxial face of the sporangium. In *Lepidostrobus*, cones which belong to various species of *Lepidodendron*, each sporophyll consists of a stalk bearing on its upper surface a radially elongated sporangium with the ligule placed in a pit just beyond. The stalk terminated in an upturned blade. Some cones are heterosporous the upper sporophylls bearing micro-sporangia, while those at the base of the cone bear mega-sporangia (fig. 9).

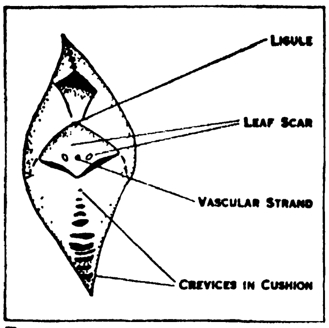

FIG. 8.—A LEAF-CUSHION FROM THE SURFACE OF A TRUNK OF A LEPIDODENDRON

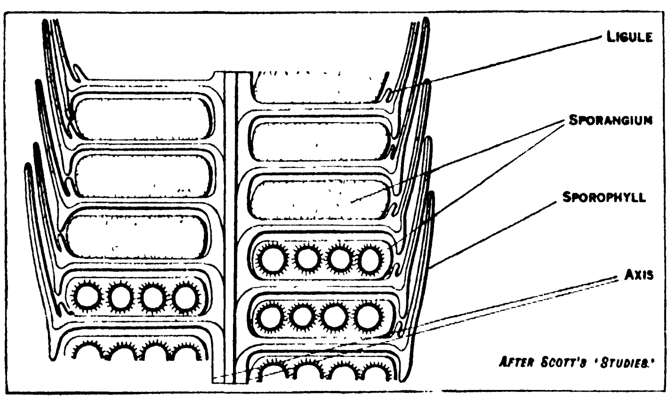

FIG. 9.—HETEROSPOROUS CONE OF LEPIDODENDRON IN LONGITUDINAL SECTION

Each megasporangium contained 8–16 megaspores. Other spores are known which bear only microsporangia or only megasporangia. It is also possible that such species bore the two kinds of cones on separate trees. Megaspores have been found with the prothallus and archegonia preserved; their reproduction must have been similar to that of *Selaginella* and it is probable that the spermatozoids which fertilised the ova in the archegonia were liberated from microspores which became entangled in the spinous processes found on the outsides of the megaspores. The chances of megaspores and microspores becoming associated in this way were largely augmented by the enormous number of microspores produced in each microsporangium. Some coals of Carboniferous age consist very largely of compressed Lycopod spores. In *Lepidocarpon* (fig. 10, B), another type of cone, only one megaspore is present in the mature sporangium and an integument, formed from an outgrowth from the sides of the sporophyll-stalk invested the sporangium except for a narrow opening along the top. In *Miadesmia* (fig. 10, A), the fructification of a herbaceous Lycopod of Carboniferous age, the integument is prolonged in the form of a sheath beyond the top of the sporangium. A fairly close comparison may be made between these two fossils and true seeds; in both fossils however, the sporophyll broke away from the parent plant with the sporangium before fertilisation took place or possibly even before microspores were deposited on it, unlike a true seed in which an embryo is usually developed before the seed is liberated from the parent plant. Among other Carboniferous lycopods *Sigillaria* occupies an important position. *Sigillaria* had a large trunk with persistent leaf bases placed either like those in *Lepidodendron* or else in vertical rows. It is probable that many *Sigillariae* were unbranched except for small, lateral, cone-bearing twigs and the tall trunks with the tufts of leaves at the tops must have presented a peculiar appearance. *Sigillaria* was heterosporous and the distribution of the two kinds of spores in the cones was probably the same as in *Lepidodendron*. In *Mazocarpon*, a sigillarian cone, the sporophylls were curiously constructed; the wall of the sporangium had a curved plate projecting from its distal end and there is no integument. A large mass of sterile tissue is present inside, and attached to, the base of the sporangium and megaspores up to the number of eight were arranged in a single layer between this sterile tissue and the wall of the sporangium. Vascular tissue is present in the centre of the sterile tissue and it connects up with the vascular strand in the sporophyll. The megaspores are concave on the side next to the sterile tissue and archegonia are present in the prothallus in each spore opposite to the place at which the spore broke open. The megaspores when dispersed broke away part of the overlying sporangium wall. *Lepidodendron* and *Sigillaria* are sometimes found attached to their root bearing parts which receive the name *Stigmaria*. The base of each *Lepidodendron* or *Sigillaria* consisted of four main downwardly directed branches which spread out and forked equally and repeatedly (fig. 7). These branching systems are often found penetrating the barren sandstone or shale underneath the seams of coal and offer certain evidence that the coal has

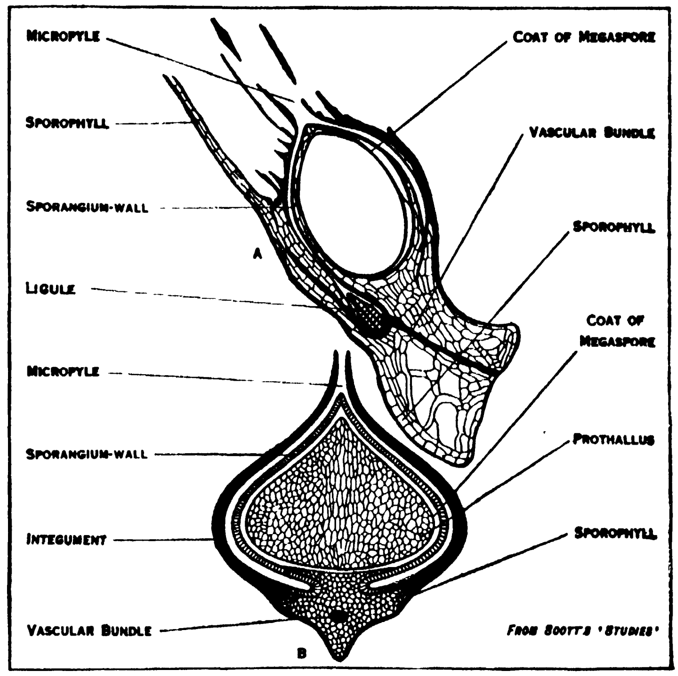

FIG. 10.—SEED-LIKE ORGANS OF SOME FOSSIL LYCOPODS
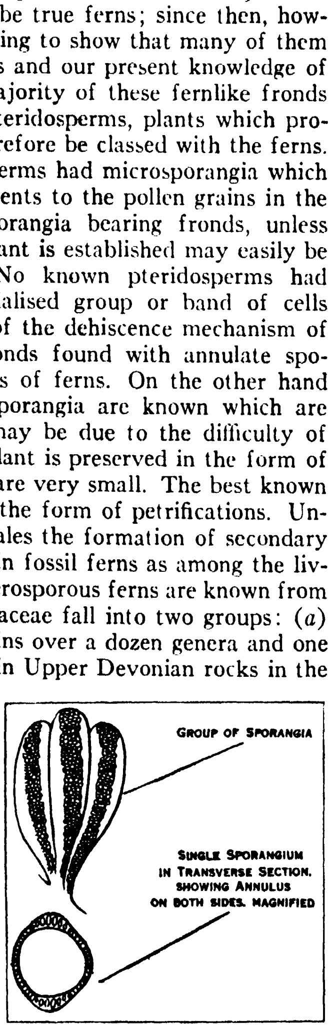
A. Miadesmia, longitudinal section of sporophyll. B. Lepidocarpon, transverse section of sporophyll

been formed in the actual place of growth of the trees from whose remains it has been formed. The surfaces of these underground branches are covered with roots which penetrated the surrounding soil. The morphology of these root-bearing structures is not yet fully elucidated; internally they are constructed more like stems than roots and the true roots which are attached to them are only very slightly endogenous. The whole branching, root-bearing system may be closely compared with the root stock of the living Isoëtes in which there is a peculiar type of secondary thickening and which bears roots very similar in structure to those of *Stigmaria.*

(*b*) Eligulatae. This group of lycopods of which *Lycopodium* is the type are not so well represented as fossils; *Spencerites*, of Carboniferous age is the only certain eligulate Lycopod known in the Palaeozoic but it is possible that *Cyclostigma*, a Devonian genus, is eligulate, for no one has yet been able to show that a ligule is present, although poor preservation might account for that.

Filicales (Ferns).—One of the striking features of the assemblage of plants found in the Carboniferous rocks is the frequency of fragments of fern-like plants. Up to the end of the 19th century these were all considered to be true ferns; since then, however, evidence has been accumulating to show that many of them belong to a higher group of plants and our present knowledge of these fossils indicates that the majority of these fernlike fronds belong to an extinct group, the pteridosperms, plants which produced seeds and which cannot therefore be classed with the ferns. In addition to seeds the pteridosperms had microsporangia which contained microspores the equivalents to the pollen grains in the flowering plants. These microsporangia bearing fronds, unless their relation to the rest of the plant is established may easily be taken for fertile fern-fronds. No known pteridosperms had microsporangia bearing the specialised group or band of cells called the annulus which is part of the dehiscence mechanism of most fern sporangia; so that fronds found with annulate sporangia are almost certainly fronds of ferns. On the other hand fertile fronds with ex-annulate sporangia are known which are also certainly ferns but here it may be due to the difficulty of detecting the annulus where the plant is preserved in the form of an incrustation and the sporangia are very small. The best known Palaeozoic ferns are preserved in the form of petrifications. Unlike the Equisetales and Lycopodiales the formation of secondary tissues was as of rare occurrence in fossil ferns as among the living and no certain examples of heterosporous ferns are known from the Palaeozoic. The Botryopteridaceae fall into two groups: (*a*) Zygopterideae. This family contains over a dozen genera and one of them, *Asteropteris,* was found in Upper Devonian rocks in the State of New York while *Ankyropteris,* the best known genus, is represented by both Carboniferous and Permian species. *Ankyropteris Grayi* from the Lower Coal Measures of England had stems about 2cm. in diameter and of considerable length; in fact it was probably a climber. Large fronds were attached at fairly wide intervals and their petioles or stalks must have nearly equalled the stem in thickness. They were arranged in spiral series on the stem and a short cylindrical branch was present in the axil of each leaf. It is possible that the axillary branch is just the smaller of the two branches of a forking of the stem effected close above the point of attachment of a leaf. The section of the coal-ball shown in Plate I., fig. 4, contains a stem cut transversely. The centre of the stele (vascular cylinder) appears as a small dark narrow-rayed star which consists of a mixture of parenchymatous tissue and tracheids; while surrounding this are the large tracheids of the periphal xylem whose outer limit retains the star-shaped outline. The annular space surrounding the xylem was produced by the decay of the phloem and the wide zone of tissue occupying the greater part of the section is the cortex. The vascular structure of the leaf-stalk is peculiar, the xylem is in the form of a doubly grooved strand which appears like a double anchor in section (hence the name of the genus). The leaflets were given off alternately on each side of the petiole. In some zygopterids these leaflets were forked at their bases so that the petiole apparently bears four rows of leaflets and has a bushy habit. The sporangia in some of the genera e.g., *Etapteris* (fig. 11) have a multiseriate annulus and are comparatively large; they were grouped in small bunches on the smaller divisions of the frond. In *Stauropteris* the stalk or rachis of the frond had four distinct rows of secondary stalks or rachises and each of these bore four rows of tertiary rachises. All the rachises are cylindrical and were presumably green as they have well developed photo-synthetic-tissue. Each frond thus consisted of a bush of small green twig-like divisions. The sporangia of *Stauropteris* had no annulus but germinating spores have been found (fig. 12) and the preliminary stages in prothallus formation is so essentially fern-like that there is no doubt that *Stauropteris* is a fern and not the pollen bearing part of a Pteridosperm, for pollen grains would behave differently on germination.



FROM ZEILLER, "BASSIN HOUILLES DE VALENCIENNES"

FIG. 11.—ETAPTERIS PINNATA

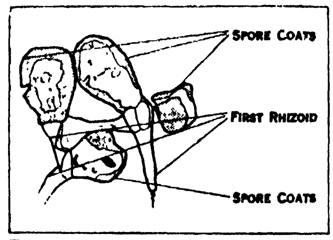


FIG. 12.—GERMINATING SPORES OF STAUROPTERIS (MAGNIFIED)

(*b*) *Botryopterideae.*—*Botryopteris cylindrica* has a long thin stem 2–5cm. in diameter bearing leaves at wide intervals and branching dichotomously but other plants belonging to the same family show considerable differences in habit. There is a simple stele consisting of a solid strand of tracheids with the smaller and first differentiated elements in the centre. The petiole is at its base very like the stem in structure. The sporangia differed from those of the Zygopterideae in being small and pear-shaped with a multiseriate annulus on one side only. The other members of the group have a more complex structure. The similarity in structure between the petiole and the stem of *Botryopteris cylindrica* is a primitive character and fits in with the suggestion that the large type of leaf or frond is derived from a subordinated lateral branch of the shoot. The Botryopterideae as a group show several points of comparison with the living Osmundaceae, representatives of which family are found in the Permian. It is also possible that the Ophioglossaceae have descended from the same stock.

Osmundaceae.—Petrified stems from the Permian are known which give satisfactory proof of the existence of plants closely agreeing in many anatomical details with *Osmunda* (royal fern). In *Thamnopteris* the woody cylinder was solid but the central part was like that in the Zygopterideae made up of parenchyma and small tracheids. There is evidence to be drawn from closely related fossils that the type of stele found in *Osmunda* has been derived in the course of descent from a solid stele such as that found in *Botryopteris, Zygopteris* and *Thamnopteris* suggesting intermediate steps in the process. Like *Osmunda* these Permian fore-runners had short stems with densely crowded fronds and adventitious roots. Fructifications of Palaeozoic Osmundaceae have not yet been recognized with certainty but *Discopteris*, an Upper Carboniferous form, has perhaps some claim to recognition

Marattiaceae.—Petrified stems have been found which in structure are so very like those of the Marattiaceae that many botanists are inclined to regard them as proof of the existence of that group in the Palaeozoic. *Psaronius,* a form-genus of tree-ferns ranges from the base of the Upper Carboniferous upwards and is quite common in the Permian. The stem has a complex vascular system, a polycylic dictyostele, except in *Psaronius Renaultii,* the Carboniferous species which has a colenostele. In these respects a close comparison is possible with the living Marattiaceae. In some species of *Psaronius* the fronds were attached alternately on opposite sides of the tree so that there were two vertical rows. In others there were several vertical series and as many as four fronds might be attached at the same

height from the ground. There was no secondary thickening but the stems were buttressed by a considerable development of adventitious roots forming a fibrous investment round them and giving them considerable rigidity. Several types of fertile fronds of Carboniferous plants are known which, though probably for the most part Pteridosperms, are fern-like and bear microsporangia grouped in synangia somewhat like those of living Marattiaceous ferns. *Asterotheca* has large multipinnate fronds which in the sterile condition would be grouped in the form-genus *Pecopteris*. The sporangia are united in synangia (fig. 13 A and A′) which are attached to small protuberances on the surface of the frond. In *Scolecopteris* the synangium has a short stalk with a central vascular strand. In the closely allied *Acitheca* the synangium has no stalk but a vascular strand is present in the central column of tissue round which the sporangia are joined and each sporangium terminates in a sharp bristle. In *Ptychocarpus* the sporangia are more intimately united and not so pointed. *Danaeites* an Upper Carboniferous type has long linear synangia, very like those of the living *Danaea*, with two rows of about 10 closely packed sporangia each of which opened by a terminal pore. In view of the fact

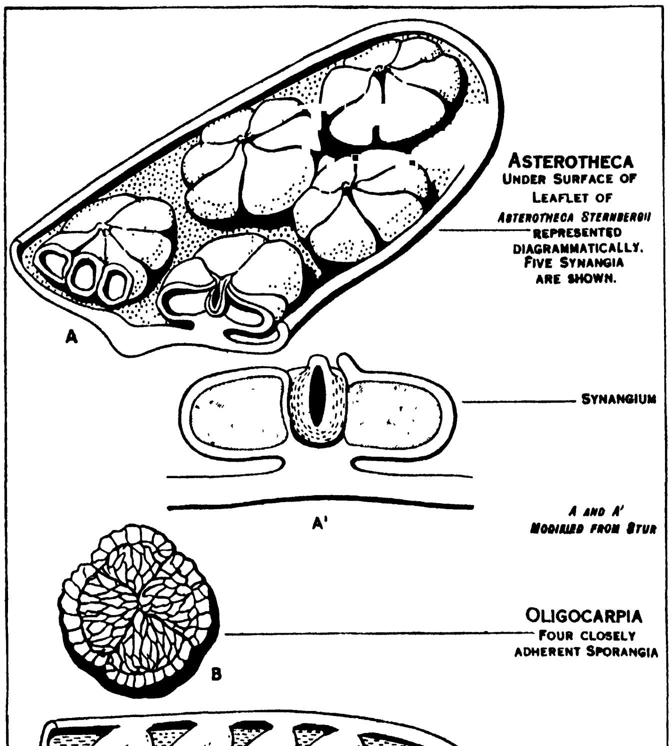

FIG. 13.—SPORANGIA OF SOME CARBONIFEROUS FERNS AND (?) PTERIDOSPERMS

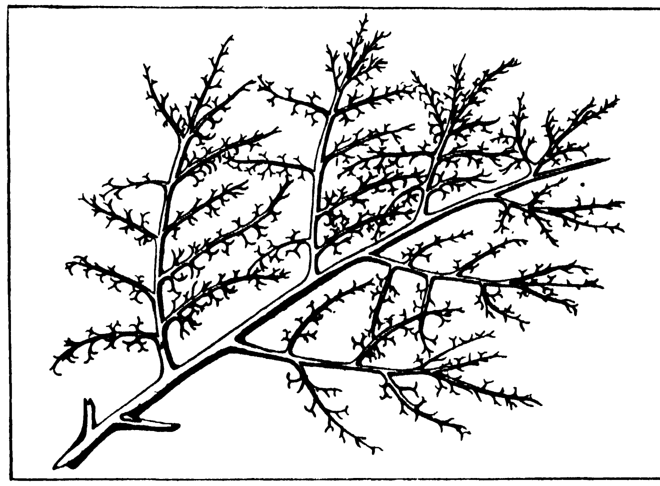
that some fructifications, known to belong to Pteridosperms, were in the form of synangia it is as yet uncertain whether most of the plants included in *Asterotheca, Scolecopteris*, etc., are ferns or pteridosperms. The evidence for the existence of Marattiaceae in the Palaeozoic rests primarily on the Marattiaceous structure of the *Psaronius* stems.

Schizaeceae. The sporangia of *Senftenbergia* (fig. 13, C), an Upper Carboniferous genus, like those of the living Schizaea have an apical group of thick-walled cells constituting an annulus. An apparently closely allied genus *Klukia* of Jurassic age would seem to form a link between *Senftenbergia* and *Schizaea* as regards the sporangial structure.

Gleicheniaceae. The evidence for the presence of Gleicheniaceae in the Palaeozoic is also slight; *Oligocarpia*, an Upper Carboniferous fern, shows in the form and grouping of sporangia close resemblance to the living *Gleichenia*. The fact that the annulus is sometimes formed of more than one series of cells led Kidston to doubt its relationship to the Gleicheniaceae; but sporangia are sometimes found with more than one series in *Gleichenia* so that this objection is not completely justified. *Chansitheca* from the

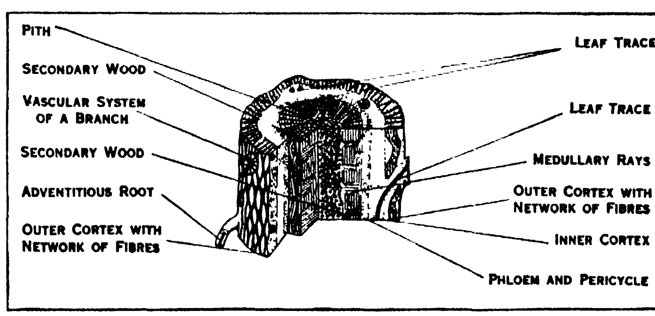


FROM KRAUSEL UND WEYLAND, "DEVONFLORA" (SENCKENBERGISCHE NATURFORSCHENDE GESELLSCHAFT)

FIG. 14.—ANEUROPHYTON, ONE OF THE MOST ANCIENT FRONDS KNOWN, FROM THE MIDDLE DEVONIAN OF GERMANY

Chansi district in China also of Upper Carboniferous age has as many as 20 sporangia in each group or sorus. It is not until the early part of the Mesozoic that undoubted Gleicheniaceae are encountered.

Pteridosperms.—A considerable number of fossils are known which have in their vegetative structure such similarity to the Ferns and indeed may well have evolved from an ancestral group of Ferns by developing in the course of their history an advanced type of heterospory in which seeds (*i.e.*, integumented megasporangia) were produced and pollination or the provision of pollen grains (microspores) to the seed took place before the seed was liberated from the parent plant. No Pteridosperms have survived to the present day, they were apparently extinct by the middle of the Jurassic period. *Eospermatopteris*, a plant rather like a tree-fern in habit with large fronds consisting of finely divided rachises and practically no lamina, has been found in the Upper Devonian rocks of New York with seed-like bodies attached to its fronds. *Hostimella racemosa* a Middle Devonian fossil from



AFTER W. C. WILLIAMSON, IN "TRANSACTIONS OF THE ROYAL SOCIETY"

FIG. 15.—DIAGRAMMATIC RECONSTRUCTION OF THE STEM OF LYGINOPTERIS

Scotland consisting of branching linear stalks bore, on short lateral branches, oval-bodies which though certainly sporangia might conceivably be seeds while fronds called *Aneurophyton* (fig. 14) have been found in the Middle Devonian of Germany closely resembling the fronds of *Eospermatopteris*; so that there is a certain amount of circumstantial evidence for the presence of Pteridosperms as early as the Middle Devonian. In the Lower Carboniferous Pteridosperms form an important constituent of the vegetation and maintain that position right through the Carboniferous, Permian and Triassic; in the Jurassic they disappear. The

Pteridosperms form a large and varied group but agree in having fern-like fronds and secondary woody thickening as a normal feature in their vascular construction. *Lyginopteris Oldhamia* the most completely known Pteridosperm is of Upper Carboniferous age and is of common occurrence in the coal-measures round Oldham and other parts of Lancashire. It is found petrified in the coal-balls and also as impressions in the shales forming the

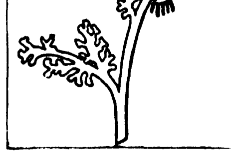
FIG. 16.—SEED AND HUSK OF LYGINOPTERIS

A. Reconstruction of the seed in its husk. B. Seed and husk cut longitudinally

roofs of the seams. The frond (Plate I., fig. 3) by an equal forking of the leaf-stalk is divided into two equal divisions. The stem (fig. 15) varies from 2 mm. to 4 cm. in diameter. There is a pith forming the core of the stem surrounded by a ring of scattered vascular strands which are connected with the leaf supply system. In older stems the ring of strands is surrounded by a considerable quantity of secondary wood and bast. The outer cortex contained long anastomosing bands of fibres which formed a reticulum just below the epidermis. In *Heterangium,* a closely allied genus the centre of the stem is occupied by a solid core of primary xylem and the strands of the leaf-trace system were incorporated in the outer part of the primary xylem. Oliver and Scott in 1903 were able to identify a petrified seed found in a coal-ball, as the seed of *Lyginopteris* by the presence on its husk of glandular spines exactly like those on the frond and stems of *Lyginopteris.* The seed, *Lagenostoma Lomaxi* (fig. 16 A and B), is enclosed in a lobed husk or cupule; it is barrel-shaped and its integument is furnished with a vascular system. One part of the nucellus (sporangium wall) is modified to form a complicated pollen chamber or cavity in which the pollen became lodged. In structure the seed is very similar to those of the living Cycads or Ginkgo but the pollen-chamber is rather more complicated than any of these living plants. Kidston described some tassels of microsporangia (fig. 17) attached to small pieces of fronds which bore leaflets of the same shape as those of *Lyginopteris* and there is no doubt that they represent the pollen producing organs of this plant. In most seed-bearing plants the microsporangia are borne on highly modified structures, stamens, which are quite unlike leaves in appearance; but in many Pteridosperms the fronds which bear the microsporangia are very like the sterile foliage fronds and in this respect the Pteridosperms are primitive.



FROM SCOTT, "STUDIES IN FOSSIL BOTANY" (A & C BLACK)

FIG 17.—CROSSOTHECA HOENINGHAUSI

Male fructification of *Lyginopteris*

The Medulloseae, another important group of Pteridosperms, of Carboniferous and Permian age had fern-like foliage belonging to the form-genera *Neuropteris* and *Alethopteris.* The stems, *Medullosa,* which are known to belong to the group are peculiarly complicated in structure; in place of the usual single vascular column they had several. Each vascular column was in structure like that of *Heterangium* and the stem could be briefly described as a polystelic *Heterangium.* The spirally arranged leaf stalks are of large size and contain a large number of small collateral vascular strands. The appearance of these petioles in section has given rise to the erroneous report that Monocotyledonous Angiosperms were present in the Carboniferous; they are however very like the petioles of Stangeria, one of the living Cycads. Another genus *Sutcliffia* had a large central stele with other smaller ones forming a system of meshes round it. Seeds have been found attached to fronds of *Neuropteris* (fig. 18, B) and *Alethopteris. Trigonocarpon* is a genus of seeds which were borne on some species of *Alethopteris;* it resembles the seeds of living Cycads in having a testa consisting of both soft and stony layers. The micropyle was of very considerable length. The pollen-producing organs of these plants (fig. 18, A and C) are still imperfectly known. *Potoniea* (fig. 18, C) very probably represents the pollen-bearing flower of a *Neuropteris.* The structures with toothed margins were originally cup-shaped with microsporangia placed on the inner surface of the cup. *Linopteris* an allied frond-genus had similar microsporangiate fructifications. Another fructification *Whittleseya* had large cups more than an inch deep and large pollen grains have been isolated from them. In *Telangium* the microsporangiate fructification consists of synangia of from 6 to 25 fusiform sporangia attached to small terminal expansion of the divisions of the fertile frond. In *Telangium bifidum* and *Telangium teilianum,* both from the Lower Carboniferous, the fertile part of the frond branched repeatedly at wide angles. In *T. teilianum* the fertile part was at the extremity of the frond (fig. 19) and two large pinnae branching off from the rachis on either side acted as the foliage part of the frond. Several specimens have been found in which there is a small abortive branch in place of the fructification and the frond was entirely vegetative in function. In *T. teilianum* the pollen producing synangia are known to have been carried on the frond in this manner while in *T. bifidum,* a closely related species small seed-husks have been found similarly

placed. The nature of the stems of *Telangium* is unknown.

A large number of fossil-stems are known which, judging from their general structure, in all probability belong to the Pteridosperms. Nothing is known about their reproduction. In *Megaloxylon,* an Upper Carboniferous genus, the vascular cylinder consisted of a solid core of primary wood. The protoxylem elements are found in groups at the periphery and when followed upwards each group passes out to a leaf. On tracing them down-

wards each group spreads laterally round the stele in a tangential direction and finally becomes indistinguishable from the rest of the primary wood and so disappears. There was a considerable development of secondary wood round the primary cylinder.

The Calamopityeae, from the Lower Carboniferous though possibly also represented in the Upper Devonian, have in the centre of the stem a mixture of tracheids and parenchyma surrounded by a ring of xylem strands in each of which the first differentiated tracheids are in the centre. Surrounding the ring of strands is a sheath of secondary wood. The vascular supply to the leaf separates from one of the large xylem strands as in *Lyginopteris* and then divides further out into two strands each of which is surrounded by its own zone of secondary wood This massive type of leaf supply is particularly characteristic of the Pteridosperms and is unlike the comparatively slender leaf-supply in the Gymnosperms. In the *Protopityeae,* unlike all plants known to be Pteridosperms, the leaves were arranged in two opposite series as in some species of *Psaronius.* The pith is elliptical with a sheath of primary xylem surrounding it The leaf vascular supply is given off from the ends of the ellipse Secondary xylem was present Of more particular interest are the stems included in the *Cladoxyleae. Cladoxylon scoparium* (fig 20) from the Middle Devonian of Germany is polystelic like *Medullosa* and the leaves which have been found in this species are deeply cleft and twig-like and are only $\frac{1}{4}$ inch in length The fertile leaves are not so deeply cleft and each division has a small terminal sporangium. Other *Cladoxyla* are known from the Lower Carboniferous; several have secondary thickening There still remains some doubt about the systematic position of *Cladoxylon* which may be either a Fern or a Pteridosperm.

Gymnosperms. (Cordaitales, Coniferales, etc)—*Cordaitales* The Pteridosperms although they produced seeds had some very obvious features of agreement with the ferns in the Cordaitales on the other hand there is little in common with the ferns and they may be regarded as fairly typical gymnosperms. There are three families provisionally grouped in the Cordaitales, the Poroxyleae, Pityeae and the Cordaiteae *Cordaites,* the type genus of the Cordaiteae, of Carboniferous and Permian age, was a lofty tree (fig. 21), unbranched except near the summit and bearing large leaves, linear or spatulate in shape The leaves are traversed with numerous parallel veins and must have looked somewhat like the leaves of the *Aspidistra;* they are inserted in spiral sequence on the stem and branches. The name *Noeggerathiopsis* has been given to similar leaves found in the Carboniferous and Permian of the Southern Hemisphere where the Southern type of Palaeozoic flora is found: there is no important difference between them and leaves of *Cordaites* and a separate name seems unnecessary. The inflorescences consist of small lateral branches each bearing numerous small catkins Each catkin is about a centimetre long and has a short stout axis In the staminate catkins the microsporangia are borne in bunches of from two to five at the ends of slender filaments which contained vascular tissue. These filaments bearing the sporangia arise from between the small, crowded scale leaves which formed the bulk of the catkin or were grouped together near the top. The pollen grains found in the sporangia are of large size. The ovulate or seed producing catkins like the staminate were formed of closely imbricating scales Short stalks bearing ovules arose at intervals between the scales and according to one investigator corresponded in position

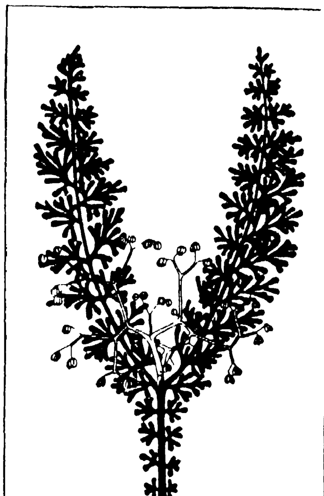

FIG 19 —FROND OF A LOWER CARBONIFEROUS PLANT, PROBABLY A PTERIDOSPERM, WITH THE TELANGIUM TYPE OF MALE FRUCTIFICATION (1/3 NATURAL SIZE)

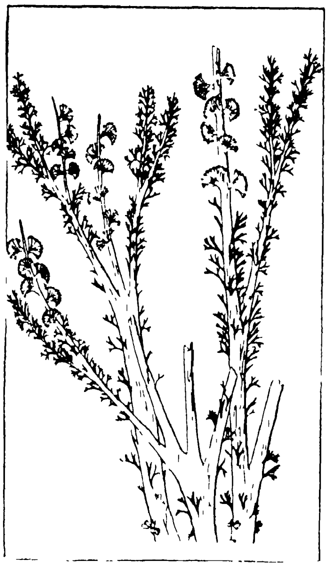
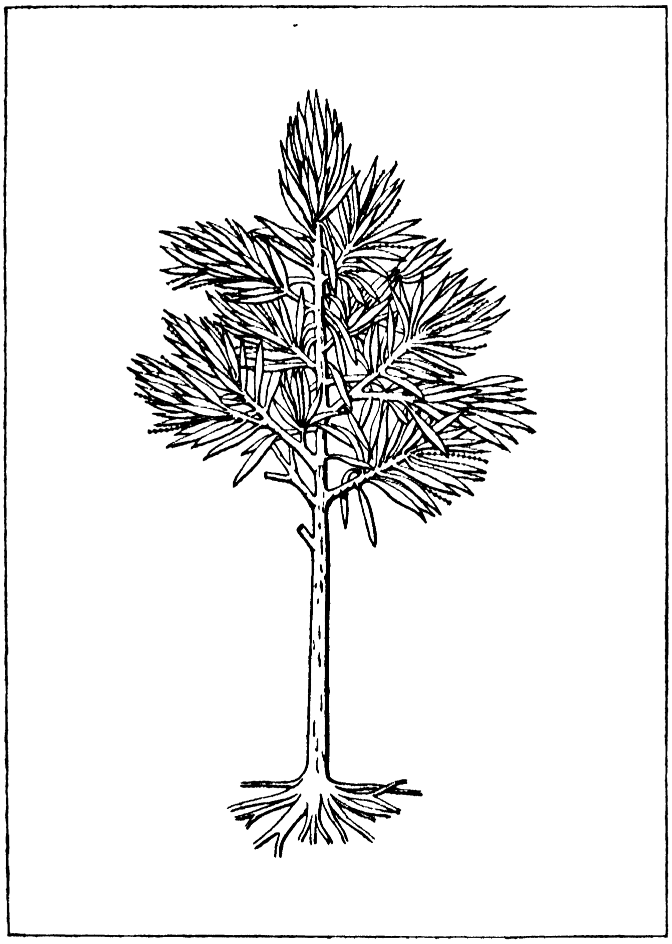
to scales In some specimens these stalks were very short but in others the seeds are found hanging out of the catkins on elongated stalks. It is possible that the stalk of the ovule lengthened as the ovule developed into a seed The ovules and seeds are flattened in a plane tangential to the catkin The integument of the ovule consisted of a hard inner layer and a fleshy outer layer while the nucellus had a well developed pollen chamber with a canal leading to it and was much like the nucellus of the living *Cycas.* In the pollen-chamber large pollen grains have been found similar to those found in the microsporangia The stem is constructed like that of a conifer except that the pith is much larger and consisted of soft tissue which split transversely into a series of diaphragms in the older condition of the stem When the stems started to decay these diaphragms broke down and internal casts in sandstone of these pith cavities exhibit transverse grooves which correspond to the remains of the diaphragms at the edge of the pith These casts receive the distinguishing name *Artisia* and it is not always possible to say whether they belong to *Cordaites* itself or to some nearly allied genus The wood is entirely centrifugal in *Cordaites* but in the closely allied genus *Mesoxylon* there was a small amount of centripetal primary wood The primary strands project into the pith. In cellular organisation the wood is very like that of the living *Araucaria* but like most other Palaeozoic woods from the Northern area there is no evidence of seasonal periodicity in the growth as indicated by the presence of "annual rings" The vascular supply to the leaf is represented by two of the primary strands surrounding the pith, which at higher level pass outwards and on reaching the base of the leaf fork repeatedly and link up with the numerous veins of the leaf lamina This double vascular connection with the axis is also found in *Ginkgo* (maiden hair tree) and is also found in the Pteridosperms In the structure of the leaf some species of *Cordaites* show close resemblance to the cycads, for in each vein the xylem is in two parts; the larger strand lying next the upper surface of the leaf consisting of centripetally developed secondary wood while the underlying strand is centrifugal with the bast lying immediately below it. In other species there is no strand of centrifugal wood Both these types of vein are found in the living cycads sometimes in the same leaf for the base of a cycad leaf centrifugal xylem may be present while higher up it may completely disappear. The veins in some species are surrounded with a sheath of cells with bordered pits just like the corresponding tissue in the leaf of the cycads. Thus in *Cordaites* we find a remarkable combination of pteridosperm, cycad and conifer characters. The fossil roots called *Amyelon radicans* though as yet they have not been found actually attached to the rest of the plant from their almost constant association and agreement in certain microscopical characters are almost certainly parts of cordaitean plants They are typical gymnosperm roots and some of the smaller ones have been found to be infested with fungal mycelium. From the position of the fungus in the roots it is almost certain that they afford an example of the association of a fungus with the higher plant which is common in living gymnosperms as well as in some of the angiosperms and is called Mycorrhiza (*q v*). The leaves of the Poroxyleae, a Permian family, attained the length of a metre and a fifth of a metre in width and show resemblance in structure to leaves of the cycads. The branches arise in the axils of the leaf as in some species of *Lyginopteris* while the vascular tissue of the branch



FROM KRAUSEL UND WEYLAND, "DEVONFLORA" (SENCKENBERGISCHE NATURFORSCHENDE GESELLSCHAFT)

FIG 20 —CLADOXYLON SCOPARIUM This is a Middle Devonian plant from Germany, with a very complex type of vascular organisation

connects up with that of the stem as in the pine. Structurally the stem is more like *Lyginopteris* than *Cordaites*. The xylem of the primary bundles surrounding the pith is entirely centripetal. Where the vascular tissue to the leaf connects with the vascular tissue of the axis it consists of two bundles similar in construction to those of cycad leaves. When traced further down the stem these two bundles appear to fuse and still lower they are only represented by a strand of secondary xylem. In the Pityeae, a Lower Carboniferous and Upper Devonian group, while there are characters indicating a relationship to the rest of the Cordaitales there are also features in their construction which mark them out as a rather distinct group. *Pitys Dayi*, a plant of arborescent habit from Lower Carboniferous rocks on the shore of the Firth of Forth, had short conical projections on its branches representing the leaves which had no flat, expanded surface. These short squat leaves must have made the tree appear like a coarse *Araucaria excelsa*. The stem had a wide pith with a ring of vascular bundles near the periphery with other smaller bundles scattered through it. The first differentiated elements are in the centre of these bundles. The relation between these strands and the rest of the vascular system is unknown. The lower part of the bundle supplying the leaf was situated in the peripheral ring and the upper part forked into three strands in the base of the leaf. A zone of secondary wood surrounded the ring of primary strands but was separated from them by a narrow zone of parenchymatous tissue. Nothing is known about the fructifications of these plants. In *Callixylon* an Upper Devonian genus there are no scattered bundles in the pith but otherwise the structure is not unlike that of *Pitys*. There is little doubt that *Callixylon* and *Pitys* are closely allied. Although an older group than the Cordaiteae and Poroxyleae the Pityeae show closer resemblance to the Araucarian conifers and less evidence of affinity to the Pteridosperms and cycads. A consideration of the comparisons that have been made between these groups leads to the belief in a common ancestral group from which they have all descended.



AFTER GRAND EURY IN SCOTT, "STUDIES OF FOSSIL BOTANY" (A & C BLACK)

FIG. 21.—RESTORATION OF A CORDAITES TREE, SHOWING ROOTS, TRUNK, AND BRANCHES BEARING LONG LANCEOLATE LEAVES AND FRUCTIFICATIONS

Coniferales.—The conifers are the most important group of living gymnosperms and there is evidence of their existence as early as the Palaeozoic. *Walchia* which appears in the Upper Carboniferous, though typically a Permian genus, had leaves and branches very like those of *Araucaria excelsa*. Casts of the pith cavity which show the course of the primary bundles show that in organisation the stem was also in substantial agreement with *Araucaria*. Cones have been found on the ends of the twigs of some species and R. Zeiller has shown that the seeds were in one species borne singly on the cone-scales, a distinctly Araucarian character. More is known about *Voltzia* a characteristic Permian and Triassic genus. The foliage shoots (fig. 22 A) of some species are much like those of *Walchia* and *Araucaria excelsa* and show the same variability in size of leaf even on closely adjoining portions of the same twig. The ovulate or seed-bearing cones (fig. 22, B) are built up of spirally arranged loosely packed scales. Each seed-bearing scale in the Permian species *V. Liebeana* (fig. 22, C, D) had three main lobes, each with a seed attached to its upper surface near its base, and two smaller lobes alternating with the three main lobes but set slightly behind them. In one specimen of a scale which has been investigated a thin pointed scale is present attached to the back of the lobed scale (fig. 22, D). The presence of this scale is of interest in considering the interrelationship of the different groups into which the living conifers are classified and in estimating their relative antiquity. In the Abietineae, the group of conifers to which the pine, cedar, larch, etc., belong, the cone is built up of two kinds of scales each with a vascular system of its own, sterile bract-scales and seed-scales which are situated in the upper angle between the bract scale and the axis of the cone and are partly coherent with the former. In the Japanese cedar (*Cryptomeria*) the two scales are coherent for a greater part of their length and only the tips are free. In others again e.g, *Sequoia* (giant tree of California) there is no outward evidence that two scales are present but the apparently single scale has a double set of vascular bundles which reveal its fundamentally double nature. In the Araucarineae the scale shows practically no indication of being double. For this reason and because the Araucarineae differ in many other ways from the rest of the Coniferae it has been suggested that they have had a separate ancestry from the others. It would appear however from a consideration of the type of double scale found in *Voltzia* which is otherwise very like an *Araucaria* that these two divisions of the Coniferae may have diverged from a common ancestral group which was represented in Permian and Triassic times by plants of the *Walchia* and *Voltzia* type.

The Distribution of Palaeozoic Floras.—We have seen that the Predevonian Floras consist of Thallophytes, either marine or fresh-water, and we have no evidence of a land vegetation until after the close of the Silurian Period. In the Devonian there is evidence of a rich vegetation from as far north as Ellesmere land and Spitsbergen and as far south as the Falkland islands; so that either the distribution of climatic zones fluctuated considerably or else the climate of the earth was more uniform. The former seems to be the more likely hypothesis. In the Lower

Devonian some large Thallophytes are still found, e.g., *Nematophyton,* while *Zosterophyllum, Psilophyton* and *Arthrostigma,* also characteristic of the period, may represent transition types between Thallophytes and Pteridophytes, but are distinctly nearer in their affinities to the latter. In the Middle Devonian more complicated types appear and in the Upper Devonian several groups of a more modern aspect such as the Lycopods and Ferns become distinct. In the Lower Carboniferous the important groups are the Pteridosperms, Lycopods, Equisetales and ferns and with this constitution the flora persists right through the rest of the Carboniferous and Permian. In the Upper Carboniferous there is evidence of a change of a far reaching nature in the southern hemisphere for a different flora is found there from that in the north. This difference was probably connected with the glacial period which prevailed in the south in Carboniferous times and which left unmistakable traces in contemporary rocks in South Africa and Australia. This southern flora, characterized by the fern-like plant *Glossopteris*, extended into parts of Russia and India but the greater part of the northern hemisphere had an Upper Carboniferous flora of the west European type. An outlier of the northern type of flora has been found in Carboniferous rocks in Sumatra, while in northern South America and in South Africa there is evidence in rocks of the same age of a flora of an intermediate type.

MESOZOIC

Introductory.—The middle period of geological history, which embraces a succession of ages extending over a few hundred million years, is known as the Mesozoic era; it is divided into three periods, the oldest or TRIASSIC period, followed by the JURASSIC and CRETACEOUS periods. The term RHAETIC (from the Rhaetian Alps) is used for the stage of earth-history between the Triassic and Jurassic periods. Before considering the march of plant-life through the Mesozoic era, it is desirable to obtain a general idea of the relation of the world's vegetation as it was at the beginning of the middle period and of the broad features of the vegetation which has been reconstructed from the remains preserved in the rocks of the post-Mesozoic or Cainozoic era. We shall then be in a better position to appreciate the relation of the floras with which we are now concerned to those which preceded and followed them. In the course of the Palaeozoic era a large portion of the earth's surface had become colonized by many different kinds of plants, some of them comparatively simple, others rivalling in the complexity of form and structure forest trees of the present day. These ancient land-plants were in all probability the modified descendants of inconceivably remote ancestors which lived in the primeval seas. A botanist familiar with the vegetation of to-day, if he could wander through the forest-covered swamps of the latter part of the Carboniferous period (the Coal age), when the Palaeozoic floras reached the zenith of their luxuriance, might at the first glance think himself in a world where tree ferns, giant horsetails (*Equisetum*) and club mosses (*Lycopodium, etc.*) played a dominant part, but on closer inspection he would find that the great majority of the plants were in many respects far removed from all modern types. If he travelled across what are now Europe and North America and extended his journey into the Arctic regions, he would discover comparatively few well marked differences between the western and eastern floras in this area. He would see certain plant-associations on the drier ground and others occupying the low-lying swamps, but the vegetation as a whole would not show any well defined contrasts. Were he to travel into central China and to the Malay region he would be struck by the general resemblance of the dominant plants to those in the northern hemisphere. We know that the forests of the Coal age included many extinct members of the class Pteridophyta (ferns, horsetails, club mosses, etc.) which in their tree-like dimensions and in other characters differed widely from the corresponding diminutive plants of our own time. We know also that nearly all the fern-like shrubs and trees were not true ferns but plants for which it has been necessary to institute a new group-name, the Pteridosperma (*see* Palaeozoic section, above), because they produced seeds in place of the spore-cases (sporangia) which are characteristic of modern ferns. Some of the trees were similar in habit and in the structure of the wood to existing members of the *Araucaria* family, but they differed from all living gymnosperms in the nature of the reproductive organs. There were a few plants with leaves agreeing in form with the fronds of cycads, the surviving representatives in the vegetation of the present day of the Cycadophyta, a class which played an increasingly important rôle as the Mesozoic floras succeeded one another. Similarly a wanderer in the Palaeozoic forests would note here and there trees with relatively broad, wedge-shaped leaves resembling in form and in venation those of the maidenhair tree (*Ginkgo*). In the absence of flowering plants (Angiosperms) and in the unfamiliar features of most of the commoner trees, the forests of the Coal age formed a striking contrast to the woodlands of the modern world. The vegetation of the latter part of the Carboniferous period persisted in diminished numbers into the Permian period which is the last chapter of Palaeozoic history. At the close of the Carboniferous period changes in the earth's crust, which were sufficiently widespread and disturbing to be described as a geological revolution, created a new environment; humid swamps were transformed into relatively dry and hilly regions or into arid wastes in which inland seas like the Caspian replaced estuaries and fresh-water lakes. This shifting of the geological background is reflected in the clearly marked change in the character of the vegetation. The plants from Permian rocks are less numerous and less varied than those preserved in the coal seams and associated sediments of the latter part of the Carboniferous period. At the end of the Palaeozoic era the development of the plant world suffered a severe check; many of the Carboniferous trees failed to survive, a few new forms were evolved, but on the whole there was no marked alteration in the main botanical features of the depauperated floras.

Leaving the threshold of the Mesozoic age we may glance for a moment at the records of plant-life preserved in the rocks classed by geologists as Cainozoic or Tertiary, the rocks which chronicle the events between the Mesozoic era and the relatively short period which began with the great Ice age and shades imperceptibly into the historical age. The vegetation of the Cainozoic era was practically identical in its general composition with that of tropical and sub-tropical lands at the present day. Then as now flowering plants (Angiosperms) were the ruling dynasty and the majority of gymnosperms, ferns and other groups were essentially similar to their descendants which flourish at the present day.

The Palaeozoic forests were archaic and unfamiliar, those of the Cainozoic periods were definitely modern. This transformation was effected during the Mesozoic era; it is therefore in hopeful expectation that the student of ancient floras turns to the fragmentary samples of the vegetable world preserved in the rocks of the intervening epoch of geological history. From a study of Mesozoic floras we might expect to be able to connect the portions of the chain of life reconstructed from Cainozoic fossils with the much more ancient pieces disinterred from Palaeozoic strata. While it is true to say that palaeobotanical research has contributed much towards a knowledge of the successive floras of the Mesozoic era, it is equally true to say that we are still groping after clues which may eventually enable us to visualize the sequence of events in the course of the middle or critical stage in the history of the plant-world. The chief purpose of this article is to present in as concise a form as possible the evolutionary tendencies in the course of the long ages separating the Palaeozoic from the Cainozoic era, so far at least as they can be discovered from the meagre documents at our disposal. The imperfection of the geological record is well put by Sir Joseph Hooker: "We have not in a fossilized condition a fraction of the plants that have existed, and not a fraction of those we have are recognizable specifically."

So far no reference has been made to the Palaeozoic vegetation in the southern hemisphere. In order to obtain as complete a picture as possible of the immediate antecedents of the earliest Meso-

zoic floras it is necessary to include in our summary the greater part of the earth's surface on which we have any information. Owing to the difficulty of defining the boundary in some regions between the Carboniferous and Permian plant-beds it has been a common practice to employ the term Permo-Carboniferous as an admission of incomplete knowledge. We have already given a brief account of some of the salient features of the Permo-Carboniferous vegetation in the northern hemisphere. It is generally agreed that on the northern continents at the close of the Carboniferous period the climatic conditions were genial and favourable to the development of a luxuriant vegetation, and that in the course of the Permian period folding of the earth's crust produced changes in the physical setting which reacted disastrously on the plant-world. We cannot separate the organic from the inorganic world; evolution must be considered from a double aspect, the evolution of the plants in relation to a changing environment.

The Glossopteris Flora.—A precise correlation of beds in widely separated parts of the world is by no means easy; we cannot, for example, assert with confidence whether or not a flora revealed by a study of late Palaeozoic rocks in India and the southern hemisphere was actually contemporaneous with the forests of the northern hemisphere Coal age, or whether certain climatic conditions demonstrated by geologists in the lands south of the Equator synchronized with a strongly contrasted climate in the North. There is, however, a strong body of evidence in support of the view that before the close of the Carboniferous period, when large areas on the northern continents were covered with forests, the southern lands were in the grip of an Ice age and supported a sparse vegetation markedly different from that found on the northern swamps. In the early days of the Carboniferous period closely allied or even specifically identical plants grew in the Arctic regions, in Australia and in many other widely separated regions; the vegetation seems to have been remarkably uniform. In the later stages of the period, on the other hand, there was a well marked differentiation into two or more botanical provinces occupied by more or less sharply contrasted floras. In the latter part of the Palaeozoic era there were two large continents in the northern hemisphere, one including North America, Greenland and Europe which is sometimes spoken of as Eria; and another embracing a large part of Siberia known as Angara Land. Beyond the world-encircling Tethys sea, which washed the southern shores of these great continents, was the vast continent of Gondwanaland, formed of what are now India, Australia, Africa and South America. In geological maps Gondwanaland is usually shown as a continuous land mass parts of which are asssumed to have foundered. If we adopted the hypothesis of Wegener, Gondwanaland would have to be represented as a portion of the crust formed of the present southern continents and India fitted into one another like pieces of a jig-saw puzzle. From this compact mass, disrupted in the Mesozoic era by deep fissures, huge blocks slowly drifted away, like icebergs from a glacier, until they reached their present positions. The Permo-Carboniferous plants and sedimentary rocks of Gondwanaland indicate a state of affairs in the organic and inorganic worlds very different from that revealed by the records in the northern hemisphere. In New South Wales, for example, rocks containing remains of Lower Carboniferous plants agreeing closely with northern species are succeeded by thick masses of old boulder clays (tillites) which afford convincing evidence of a glacial period at the close of the Palaeozoic era, a reign of ice probably longer and more widespread than that which in comparatively recent times held sway over North America and Europe. Geological investigations in Australia have established the fact that before the end of the Carboniferous period the earth's crust was uplifted into mountain-ranges and conditions were produced favourable to the accumulation of ice and snow. Throughout geological history there were recurrent cycles of mountain-building and shifting of the scenes which produced new sets of factors conditioning plant-life; revolutions in the inorganic world caused transformations in the organic world. The story told by the series of plant-beds and glacial deposits in Australia, though differing in detail from that derived from a study of the corresponding strata in India, South America and Africa is broadly speaking the same for Gondwanaland as a whole. Beds of boulder clay containing innumerable erratic blocks, often many tons in weight and resting on platforms grooved and striated by slowly moving rock-studded masses of ice, occur over thousands of square miles from one end of Gondwanaland to the other, from the Falkland Islands to Tasmania, from northern Australia to Afghanistan. The approximate areas which are occupied by glacial beds are indicated in the map. The discovery of plant remains in the Argentine and in South Africa at the base of the glacial beds shows that in these regions, as probably elsewhere, the climatic conditions were not fatal to the existence of vegetation.

Gondwanaland towards the close of the Palaeozoic era may be compared with Alaska and Greenland at the present day, where glaciers and ice-sheets are bordered by an Arctic vegetation. One of the commonest Permo-Carboniferous plants on the southern continent was the genus *Glossopteris* (fig. 1), so named from the tongue-like form of the leaves, the larger of which reached a length of more than a foot. From a well-defined mid-rib are given off arching veins which by repeated unions form a fairly regular network. *Glossopteris* was formerly regarded as a fern similar in its fronds to the existing hart's tongue (*Scolopendrium*) but differing from it in the architecture of the venation; it is now believed to be a member of the Pteridosperms (*see* above) Seeds and leaves have not been found in organic union, but their frequent association in the rocks and the discovery of certain other pieces of evidence favour the conclusion that the stems which bore *Glossopteris* leaves bore also seeds. Because of the abundance of *Glossopteris* fronds and pieces of the stems (*Vertebraria*) the flora of Gondwanaland is usually spoken of as the *Glossopteris flora.* Another common genus is *Gangamopteris* with leaves on the whole larger than those of *Glossopteris* and distinguished by the feeble development or absence of a mid-rib: the two forms of leaf are not always easy to separate. Both genera are almost certainly Pteridosperms. *Schizoneura* is also a characteristic southern genus: more robust than *Equisetum* but similar to the horsetail in its jointed stems, it is distinguished from the northern hemisphere *Calamites* by its longer and broader leaves coalescent in varying degrees into a sheath which enveloped the foliage-shoots at each node. The genus *Neuropteridium* (*Gondwanidium*) (fig. 2) is represented by simple pinnate fronds superficially resembling those of some modern ferns and characterized by the large lobed leaflets; from the lack of fertile leaves one suspects that it may be a Pteridosperm. Two sets of fronds have been called *Neuropteridium,* Permo-Carboniferous and Triassic fronds. It has recently been suggested that, as there is no satisfactory evidence of generic identity, the older forms should be renamed *Gondwanidium, Neuropteridium* being reserved for Triassic fronds (fig. 11), which were probably borne on ferns and not on Pteridosperms These four genera do not occur in the later Carboniferous or in the Lower Permian floras on the continents north of the Tethys sea. The Tethys was a broad sea, stretching across the world. The Mediterranean is its diminutive modern representative. The discovery in 1912 of *Glossopteris* and thin beds of coal by the heroic members of the second Scott expedition on the Beardmore glacier, 300m. from the South Pole, points to the existence of this plant far within the Antarctic circle. It also suggests the possibility that *Glossopteris* and perhaps some of its associates had their origin in the far South.

With the more typical and more abundant members of the Glossopteris flora are associated in some regions, plants generically indistinguishable from northern forms. The long strap-like leaves originally described as *Noeggerathiopsis,* similar in size and shape to the foliage of *Yucca,* appear to be the foliage of trees closely allied to the common northern genus *Cordaites.* Similarly a few species of *Sigillaria* and *Lepidodendron* are recorded from South Africa and South America in company with *Glossopteris.* Other genera which afford points of contact between the two great botanical provinces are *Psaronius,* recorded from Brazil, a tree-fern allied to the tropical Marattiaceae in modern floras; the genus *Sphenophyllum* discovered in India, South Africa and Australia, *Psygmophyllum* with wedge-shaped, lobed leaves similar in form to those of *Ginkgo biloba* (the maidenhair tree) but not neces-

FIGS. 1–11 — EXAMPLES OF MESOZOIC PLANTS AND TWO LIVING FERNS CLOSELY RELATED TO CERTAIN MESOZOIC FERNS

1. Two forms of *Glossopteris* (A ½ nat. size, B nat. size). 2. *Neuropteridium*, probably a Pteridosperm, slightly less than nat. size. 3. Branch of *Podozamites*, ⅔ nat. size. 4. Fronds of *Thinnfeldia* (A slightly reduced, B slightly enlarged). 5. *Matonia* (taller) and *Dipteris*, ferns, much reduced. 6. Cycadean frond. ½ nat. size. 7. Two leaves of *Sagenopteris* (A nat. size, B slightly enlarged). 8. Fruits believed to belong to *Sagenopteris*. 8a. Restoration of *Gristhorpia Nathorati*, nearly twice nat. size. 8b. *Caytonia Sewardi*, fruit. 8c. *Caytonia Sewardi*, longitudinal section. 9. Stem of *Cycadeoidea gigantea*, ⅛ nat. size. 10a. Restoration of an unexpanded inflorescence, nat. size. 10b. Surface-view of seed-bearing centre (conical apex in 10a). 11. Fronds of *Neuropteridium*, attached to stem. ¼ nat. size

sarily a member of the same class; also a few fern-like fronds which are probably Pteridosperms.

Apart from the abundance of *Glossopteris*, *Gangamopteris* and some other genera peculiar to the Gondwanaland flora, the most striking distinctive feature of the southern vegetation is the absence of the great majority of species and of many genera which played a prominent part in the northern forests. The important point is that the flora of Gondwanaland was relatively meagre and the commonest plants were peculiar to the southern province at least up to the time of the middle of the Permian period. Several years ago some leaves of *Glossopteris* were found in beds of Upper Permian age in northern Russia; more recently this and other members of southern flora have been recorded from several localities in Siberia, also remains of an Upper Permian flora which differed from contemporary floras in the northern hemisphere in the admixture of Gondwanaland species with plants characteristic of the northern province. This Kusnezk flora, so called from the locality in Siberia, has been traced from northern Russia through Siberia and north-west Mongolia to the coast at Vladivostock: it includes with *Glossopteris* such genera as *Neuropteris*, *Callipteridium*, and *Lepidodendron* represented by species characteristic of the northern province. With the Palaeozoic species agreeing with northern or southern forms it is of special interest to find some genera which are characteristic of Mesozoic

floras: examples of these are species of *Baiera, Phoenicopsis, Czekanowskia,* all members of the Ginkgoales, characteristic of pre-Cretaceous Mesozoic floras and more or less closely allied to the maidenhair tree; also *Podozamites* (fig. 3), a genus of uncertain affinity but a gymnosperm probably similar in habit to recent species of the conifer *Agathis* (the kauri pine, etc.) which was very widespread in the earlier Mesozoic floras; *Voltzia,* a conifer, simulating in its leaves some living Araucarias, characteristic of Permian and early Triassic floras in the northern hemisphere and recorded from the Glossopteris flora of India, also *Dioonites,* a genus founded on cycad-like fronds similar to those of the existing Mexican genus *Dioon.* The discovery of beds containing Kusnezk species on the coast of Ussuri Land overlain by strata containing the typical Lower Triassic genus *Pleuromeia* indicates a Permian age for this widespread flora despite the occurrence of several Mesozoic types. There must have been a northward migration of *Glossopteris* and some of its companions across the Tethys sea either by a chain of islands or by a land-bridge. The genus *Glossopteris* is one of several genera which probably originated in the southern hemisphere and gradually spread across the Equator; by the end of the Permian period it was firmly established in the province of the Kusnezk flora and it has recently been recognized in the Rhaetic flora of Scoresby Sound, which is in east Greenland. Similarly the occurrence of *Schizoneura* in the early Triassic flora of western Europe illustrates the penetration of members of the Glossopteris flora into the northern hemisphere in the early part of the Mesozoic era.

It has recently been shown that the Permian or Permo-Carboniferous vegetation of some regions in China was of the typical northern type. Prof. Halle of Stockholm in an exceptionally important memoir (1927) has given an account of the late Palaeozoic floras of central Shansi which are preserved in two series of sediments; the older strata known as the Yuehmenkou series and above it the Shihhotse series. Both floras included species of *Calamites, Sphenophyllum, Pecopteris, Callipteridium, Cordaites, Stigmaria* and other northern Permo-Carboniferous types As in the Kusnezk flora so also in the collections from the Shihhotse series there are species belonging to genera such as *Cladophlebis, Neuropteridium, Chiropteris* and *Dioonites* which bear a very close resemblance to members of Triassic floras in many parts of the world. *Chiropteris* is a genus represented by broad leaves with forking and anastomosing veins which in form remind one of the fronds of some species of the fern *Ophioglossum;* its systematic position is uncertain. Specimens are recorded from Triassic beds in Germany, South Africa and elsewhere. The name *Cladophlebis* is given to the branched fern fronds bearing comparatively short and often slightly curved leaflets, with a central rib and arching, forked lateral veins, attached by the whole of the base; species are characteristic of many Mesozoic floras but are seldom met with in Palaeozoic floras. The Shansi floras differ from the Kusnezk flora in the absence of *Glossopteris* and other Gondwanaland plants. The Shihhotse series is overlain by barren sedimentary beds indicative of desert conditions; it is highly probable, as Halle suggests, that in these beds we have evidence of a change from a genial and humid to a dry climate, which coincided in date with a corresponding revolution chronicled in the Permian period over a wide area in the northern hemisphere. Floras similar to those of Shansi are recorded also from Korea.

This incomplete presentation of facts may serve to illustrate some of the broad features in the distribution and composition of floras at the stage of geological history immediately antecedent to the Mesozoic era. There were at least three botanical provinces characterized by floras that were distinguished by the abundance of certain genera: (1) A very widely distributed and fairly homogeneous northern flora which probably had its origin in the lands north of the Tethys sea and spread southward into China and members of it reached the Malayan region as invaders of the realm of Gondwanaland; (2) the Glossopteris flora from which in late Permian days some of the plants wandered far to the north, and *Glossopteris* penetrated to Greenland well within the Arctic circle; (3) the Kusnezk flora of Upper Permian age, which was in part composed of plants which had found their way across the Tethys sea from the south and in part of representatives of northern Permian floras.

At the beginning of the Mesozoic era the prevalence of desert conditions over a wide area in North America and in the Old World was highly unfavourable to the further development or the continued existence of many members of the rich Permo-Carboniferous flora. By far the greater number of the Palaeozoic species failed to survive; a few new forms were evolved, and some plants such as *Schizoneura* and *Voltzia* were immigrants from Gondwanaland. A comparison of late Palaeozoic and early Mesozoic floras reveals a sharp contrast which furnishes an interesting illustration of the interdependence of organic and inorganic evolution, of the effect of changing geographical conditions on the evolution of the plant world. One of the well established conclusions of geologists is that there have been recurrent cycles of mountain-building and, as a necessary consequence, recurrent interferences with the factors conditioning plant life. One of these geological revolutions occurred at the end of the Palaeozoic era not only in the northern hemisphere but also in China and in some other regions. One of the more important aims of the student of evolution is to discover connecting links in the plant world, particularly at epochs of widespread crustal disturbances. Attention has already been called to the presence in late Permian floras of genera that are characteristic of Mesozoic floras: types, which became prominent in the latter part of the Triassic period and persisted through the several stages of the Jurassic period, were already in existence, though in a subordinate position, before the close of the Permian period The greatest contrast between the two eras is the marked difference in the general facies of the vegetation consequent on the disappearance of most of the commoner members of the older forests; but there is also a considerable difference which is due to the relative abundance in the Mesozoic floras of plants of more modern aspect, plants that are closely akin to living species as contrasted with the more archaic and much less familiar types in the Palaeozoic floras. A comparison of the rich fern vegetation of the Upper Triassic and Rhaetic floras with the comparatively small number of true ferns in the Permo-Carboniferous vegetation raises a question which has not been fully answered; whence came the more modern types of ferns which characterize the Mesozoic floras? The late Palaeozoic ferns, apart from the Marattiaceae, which can be linked with Triassic and Rhaetic forms are very few, and the evidence they afford of direct relationship to Mesozoic ferns is not convincing.

Triassic Floras.—In a general account of the Mesozoic floras it would be out of place to discuss the precise geological horizons within the Triassic period of the plant-bearing strata in different parts of the world, but it is important to consider the composition of the earlier Triassic floras in contrast to the richer plant communities which characterize the later stages of the period.

Remains of early Triassic floras have been found at a few localities in Europe, notably in the Vosges district, on the northern edge of the Eifel, and elsewhere. Characteristic genera are *Pleuromeia, Schizoneura, Voltzia, Albertia, Pelourdea, Neuropteridium, Equisetites* and a few examples of Cycadean plants. *Pleuromeia* is represented by stems, occasionally reaching a length of 2 metres or more, with spirally disposed leaf-scars similar to those on some species of the older genus *Sigillaria.* On the upper region of the stem were overlapping, short and broad scales bearing seed-like reproductive organs. The lobed and swollen base of the stem bearing numerous rootlets suggests comparison with the living quillworts (*Isoetes*). We may picture the plant as a comparatively low unbranched shrub bearing needle-like leaves and at a higher level shorter and broader fertile scales, growing probably among sand dunes in arid regions. It is one of the rare links discovered in Mesozoic floras with the tree-like lycopodiaceous plants of the Coal age. Along with species of *Schizoneura* occur large stems of *Equisetites* differing in their ampler proportions and possibly in structure from modern horsetails. *Voltzia* is a conifer resembling in its foliage-shoots and in the structure of the wood species of *Araucaria, e.g.,* the Norfolk Island pine, *Araucaria excelsa,* but in some respects differing from all recent conifers notably in the structure of the female shoots. *Albertia* with its broader

leaves recalling those of *Agathis*—the genus which includes the kauri pine of New Zealand—may also be related to the Araucarias. In Arizona over many square miles of country petrified trunks of trees, some probably 200ft. in length, have been laid bare by the denudation of early Triassic rocks; many of the stems are Araucarian or have Araucarian characters. Specimens of ribbon-like leaves have been described from Triassic beds as species of *Yuccites, Bambusium,* etc., because of their similarity to the leaves of *Yucca* and bamboos. It has been proposed to refer them to the non-committal genus *Pelourdea.* The probability is that these leaves were borne by plants descended from *Cordaites* or other Palaeozoic gymnosperms.

Reference has already been made to the fern-like fronds of *Neuropteridium* (*Gondwanidium*) as fossils characteristic of the Glossopteris flora; the name *Neuropteridium* is applied also to some Triassic leaves (fig. 11) which are probably not directly related to the southern and older examples. The occurrence of a few fronds such as *Dioonites* and *Zamites* in earlier Triassic floras prepares us for the rapid development of the Cycadophyta in the Rhaetic and Jurassic floras. It is, however, important to note that these generic names, suggested by the resemblance of the fossil leaves to those of the living Mexican and American Cycads *Zamia* and *Dioon,* should not be regarded as evidence of close affinity of the extinct to the living forms.

The much greater abundance and variety of plants in later as compared with the earlier Triassic floras affords evidence of amelioration in the physical environment. Collections made from the Richmond coal field in Virginia and from Upper Triassic beds in Austria and Switzerland enable us to follow the main lines along which the plant world was developing. Among equisetaceous types attention may be called to the genus *Neocalamites* which is not always readily distinguishable from *Schizoneura.* It is characterized by long linear leaves springing in circles from the nodal joints and free to the base instead of being united into a sheath as in *Equisetum. Neocalamites* was a very widely distributed Triassic genus; it is recorded from Tongking, from South Africa and Australia, as well as from northern localities. A notable feature of the Keuper floras is the abundance of ferns; *Macrotaeniopteris,* characterized by simple banana-like fronds reaching a length of a metre and a breadth of 17cm., is probably a fern though no sporangia have been discovered. Fronds often described as species of *Acrostichites,* an unfortunate name because of its implication of relationship to the living genus *Acrostichum,* are in some instances at least members of the Osmundaceae, a family which has been traced as far back as the Permian period. *Clathropteris platyphylla,* with its large fronds divided into spreading lobes like the segments of a horse chestnut leaf and its approximately rectangular meshes of slender veins on either side of a central rib, is one of many ferns in Mesozoic floras agreeing closely with the Indian and Malayan species of the genus *Dipteris.* The family Marattiaceae, now characteristic of the Tropics, was also represented by *Pseudodanaeopsis, Marattiopsis* and other genera closely resembling recent tropical species. These and other ferns are a few of many Triassic genera which give a modern aspect to the earlier Mesozoic floras.

Another distinguishing feature of the later Triassic floras is the abundance of the Cycadophyta as illustrated by such genera as *Sphenozamites* with its handsome fronds bearing two rows of large truncate segments, *Pterophyllum* and *Pseudoctenis* with fronds similar to those of several existing cycads in the form of the leaflets. It must be remembered that the term Cycadophyta is used in a comprehensive sense embracing not only the living cycads, represented by a comparatively small number of species and genera for the most part tropical in range, but also an extinct group, the Bennettitales. The Bennettitales reached their maximum development in the Jurassic period and in the early days of the Cretaceous period when they were represented by a large number of types: in the form and structure of the stem and in their large palm-like leaves many of them must have borne a striking resemblance to modern cycads, but in the structure of the reproductive organs they differed in many characters from all existing cycads (*see* p. 86). The point which concerns us at the moment is that the much greater wealth of cycadean plants in the later Triassic floras than in the earlier floras of the same period prepares us for their further increase in Rhaetic and Jurassic floras. Similarly the occurrence in some Triassic beds of the genus *Thinnfeldia* (fig. 4), which is probably a pteridosperm, characterized by fern-like fronds with leathery leaflets, is another example of the appearance of a new type which played a conspicuous part in Triassic, Rhaetic and Jurassic floras in almost all regions of the world.

The abundance in Upper Triassic floras of large-leaved species of the class Ginkgoales is a noteworthy character; the genus *Baiera* represented by large wedge-shaped leaves cut into linear segments and, in the more typical species, without a leaf-stalk, though already in existence in the Palaeozoic era began to play a prominent rôle in the vegetation of the Keuper stage; it persisted through the Rhaetic and Jurassic periods and survived into the Cretaceous.

Among other gymnosperms reference may be made to *Podozamites* (fig. 3), a tree with leaves similar to those of species of the living conifer *Agathis,* but distinguished from all recent genera by bearing its short, fertile, seed-bearing leaves in loose catkin-like clusters. *Podozamites* is an example of a genus which began its career in the Triassic period and became a cosmopolitan and abundant plant in Rhaetic and Jurassic floras. Our knowledge of the conifers is scanty; *Voltzia* survived from the early Triassic floras and with it some other members of the group which, through lack of material, cannot be closely compared with modern types.

In illustration of the salient features of the Triassic vegetation of Gondwanaland a brief reference is made to the plant-beds of South Africa. Sedimentary strata included in the Stormberg series have yielded a flora which shows many points of contact with the floras of the northern hemisphere. *Voltzia, Baiera, Pterophyllum, Pseudoctenis, Thinnfeldia, Schizoneura, Neocalamites,* genera of true ferns and plants with fern-like fronds occur with *Glossopteris* and other genera peculiar to southern Triassic floras. One of the most remarkable constituents of the South African vegetation is the genus *Rhexoxylon* founded on petrified wood; this was at first believed to be allied to a Palaeozoic group of gymnosperms, the Medulloseae, but an examination of additional specimens led J. Walton to compare it with certain species of *Dadoxylon,* a genus of conifers. The stem of *Rhexoxylon* reached a length of several metres and a diameter of 25cm.; it is characterized by a large pith with secretory ducts and some scattered vascular bundles, but more especially by the unusual arrangement of the wood, which was divided into wedge-shaped masses separated by bands of softer tissue and bears a very striking resemblance to the structure of some Dicotyledonous climbers in the tropical forests of the present day. *Rhexoxylon* is recorded from Triassic and probably Rhaetic beds in South Africa, and from the Antarctic continent. Nothing is known of the leaves or reproductive organs; the most interesting feature is the close agreement in the structure of the stem with that of certain living plants belonging to an entirely different section of the vegetable kingdom.

From a comparison of the fossil plants obtained from South Africa, India, Australia and South America it has been established that in its main features the Triassic vegetation of Gondwanaland was fairly uniform; many of the genera are common to both hemispheres and the distinction between the northern and southern continents was less obvious than in the latter part of the Palaeozoic era.

Rhaetic Floras.—The Rhaetic floras, richer than those of the Keuper series, are preserved in deposits formed for the most part in the estuaries of rivers and represented in many widely separated regions. Between the late Triassic plants and those furnished by the overlying Rhaetic rocks the difference is comparatively slight; there is a greater wealth of material in the Rhaetic beds and, though new forms occur, the general facies is similar to that of the Keuper vegetation. A rich Rhaetic flora has been described from Tongking; another equally rich flora has left abundant remains in southern Sweden and more recently a no less luxuriant flora has been described from Rhaetic rocks in the Scoresby

Sound district in Greenland (Harris, 1926). Collections of the same geological age have been made from central Europe and from many other regions. Though it is not easy precisely to correlate the rocks of Gondwanaland with those in the northern hemisphere, we know that in its broader features the vegetation which flourished south of the Tethys sea agreed with that of the rest of the world. This statement is not intended to give the impression of a vegetation unaffected by differences in climate; there were undoubtedly regional peculiarities, but there were many genera which appear to have had a remarkably wide geographical range. In the Rhaetic flora of Tongking *Glossopteris* is a connecting link with the Permo-Carboniferous vegetation of Gondwanaland, and the recently re-recorded occurrence of the genus as far north as Lat. 70° N. in Greenland demonstrates clearly its capacity as a traveller. In the Tongking flora we find also *Equisetites* and *Neocalamites* represented by species closely allied to northern forms. Among the ferns are many splendid examples of *Dictyophyllum* and *Clathropteris,* suggestive of the fronds of Malayan species of *Dipteris* (fig. 5, the smaller fronds); also of the *Osmunda* family. The various forms of simple *Taeniopteris* leaves recalling those of the hart's tongue (*Scolopendrium*), may be the foliage of Cycadophyta and not true ferns. *Pterophyllum* seems to have been one of the most conspicuous members of the Cycadophyta, a class represented by other genera such as *Ptilophyllum* and *Otozamites.* The fronds known as *Ptilophyllum* are characterized by two rows of linear segments giving them an appearance similar to that of the leaves of the Mexican cycad *Dioon: Otozamites* fronds are distinguished by the eared base of the segments which are occasionally relatively broad. Species of the cosmopolitan *Podozamites* also occur. It is pointed out by Dr. du Toit, in his recent account of the older Mesozoic floras of South Africa, that while the Tongking flora contained several plants specifically identical with South African and Australian forms, the absence in the Far Eastern vegetation of *Ginkgoites, Thinnfeldia* and other common Rhaetic genera is an interesting feature.

As we analyse more carefully the Triassic-Rhaetic floras of the world we shall no doubt find evidence of regional differences comparable, though less pronounced, to those in the vegetation at the present day. The close correspondence between the floras of east Greenland and the province of Scania (southern Sweden) is a remarkable fact. When we think of the enormous difference between the present north Temperate vegetation of Sweden and the treeless and stunted Arctic flora it is very difficult to understand the extraordinary resemblance presented by the two fossil floras, not only in the number and variety of the plants but also in the size of the vegetative organs. It is very unlikely, so astronomers tell us, that the earth's axis has changed its position, or at least to an extent that would make any appreciable difference to climatic conditions during that portion of geological history with which we are concerned. A possible explanation is offered by the Wegener hypothesis; in the Rhaetic period Greenland may have occupied a position relative to Europe and to the north pole different from that which it occupies to-day. There seems to be no satisfactory solution of this and other climatic problems raised by palaeobotanical researches if we reject, as we probably must, the suggestion that the axis of the earth has altered its position, and if we follow some of Wegener's critics and reject also the hypothesis which assumes changes in the relative positions of portions of the earth's crust.

There are few more attractive problems than those raised by the discovery of comparatively luxuriant floras in the Arctic regions. It is clearly impossible to make any definite statement of scientific value as to the temperature necessary for the existence of a vegetation composed of extinct species. We are apt to assume that a plant from Rhaetic or other strata, if it bears a resemblance to one which still exists, must have required for its normal development climatic or other conditions approximately the same as those prevailing in the localities of its modern representative. Such an assumption might be reasonable if based on a comparison of an assemblage of many extinct and recent forms, but it must be remembered that living plants closely related to one another are often able to exist in places with sharply contrasted temperatures. Making due allowance for the adaptability of closely allied species to widely different conditions, and admitting the danger of applying knowledge derived from observations on living plants to species which became extinct many million years ago, there remains the problem of accounting for the occurrence in southern Sweden and in eastern Greenland of floras that are in general terms identical.

What then are the salient features of the Arctic Rhaetic flora? Among the Equisetales are species of *Neocalamites* in no way inferior to those from Queensland, Tongking, South Africa and elsewhere. The discovery of a large Lycopodiaceous cone, *Lycostrobus Scotti*, in the Rhaetic flora of Sweden and the subsequent recognition of spores in the Greenland beds, which are almost certainly referable to *Lycostrobus,* affords one of the few instances of the survival into the Rhaetic period of a plant bearing a striking resemblance to the Lepidodendra of the Carboniferous forests. Ferns are represented by large fronds of the genus *Todites*, that are so named from their likeness in form and in the structure of the spore-capsules (sporangia) to the living osmundaceous fern *Todea barbara* of South Africa and New Zealand, and by species with fronds of the type designated as *Cladophlebis* a genus that was widespread also in the Jurassic period. The occurrence in Greenland of pieces of fronds hardly distinguishable from a species of *Gleichenites* described from the Lower Jurassic flora of Franconia in Germany, affords some evidence of the existence in the Arctic flora of a member of a family that is now very widely spread in the Tropics and in the Cretaceous period was particularly prominent in the vegetation of western Greenland. Among other ferns are *Matonidium*, similar in habit to the living Matonia (fig. 5), *Laccopteris, Dictyophyllum*, and *Hausmannia,* genera agreeing in habit and in the structure of the sporangia with what has been called by F. O. Bower the *Matonia-Dipteris* alliance.

One of the most clearly established facts in the history of ferns is the striking contrast between the present restricted geographical range of the two Malayan genera *Matonia* and *Dipteris* and the almost world-wide range of Mesozoic ferns, described under several generic names, which are believed on good evidence to be nearly related to one or other of these plants. The two living genera, figured by A. R. Wallace (fig. 5) side by side on Mt. Ophir in the Malay Peninsula, may be regarded as relics of a remote past, survivors of a line of ancient lineage, which after wandering over the world from Arctic lands to the far south and east persist as impressive links with a vanished world.

Reference has already been made to the genus *Thinnfeldia;* the fronds of this plant and those of a somewhat similar genus *Lepidopteris* are widely scattered Rhaetic types. *Lepidopteris,* bearing small, thick leaflets with rounded tips, is one of the Rhaetic genera which though fern-like in habit is probably a Pteridosperm: it is recorded from Greenland, Sweden, Germany, Poland and Madagascar. *Thinnfeldia* and *Lepidopteris* differ from ferns in the more leathery texture of the leaflets, which are more resistant than those of ferns to certain chemical reagents, and by the absence of any sporangia of the typical filicean type. Both may be Pteridosperms, anachronisms in the Mesozoic floras.

As we pass from Triassic to Rhaetic floras cycadean plants increase in number and diversity of habit. Our knowledge of these plants is based mainly on external form of the fronds, some simple and undivided, others with a lamina dissected into broad, equal or unequal segments (for example, *Nilssonia*) or, as in the leaves of modern cycads, with separate leaflets attached to a strong rachis (*e.g., Zamites,* fig. 6, and *Otozamites*). It has, however, been possible to supplement the distinguishing characters afforded by external differences by the more trustworthy criteria furnished by the microscopical structure of the epidermal layers. We know little of the reproductive organs of many of the Mesozoic Cycadophyta, but in a few instances it has been possible to make out the characters of both the male and female organs. One example may be quoted: Prof. Nathorst described under the name *Wielandiella* regularly forking stems bearing in the angles bud-like shoots consisting of a short and thick axis

covered with a mosaic of two kinds of appendages, the greater number sterile, slender scales (interseminal scales) with slightly expanded flat tops surrounding similar appendages which were fertile and bore each a small terminal seed. These seed-bearing and sterile scales may be regarded as modified leaves. From the base of the fertile axis "flower" were given off short modified leaves bearing sporangia containing microspores (pollen-grains). The whole fertile shoot was surrounded by linear leaves (bracts). On the forked stem were simple foliage leaves similar in shape to small fronds of a hart's tongue fern but with the blade divided into segments. The plants must have resembled a shrubby *Magnolia,* the fertile shoots being superficially comparable to the flower but differing from all existing flowers in the nature of the female organs. *Wielandiella* agrees in the general plan of its "flowers" with the genera *Cycadeoidea* and *Williamsonia,* that came into prominence in the Jurassic period and flourished in the early days of the Cretaceous period. The two latter genera agreed in form and to a large extent in structure with living cycads: *Wielandiella* on the other hand differed widely both from the two extinct genera and from all recent cycads in the much more slender and dichotomously branched stem.

Among other genera met with in Rhaetic floras in many parts of the world are *Sagenopteris* and *Podozamites. Sagenopteris* is represented by leaves with a few (three to six) narrow oval or elliptical leaflets springing like the fingers of a hand from a single stalk and resembling *Glossopteris* in the network of veins. The genus has often been compared, on account of leaf resemblance, with the water fern *Marsilia,* but Dr. Thomas has made out a good case in favour of referring to *Sagenopteris* two different kinds of fertile shoots, or catkins, bearing spherical fruits (fig. 8A) or groups of pollen-sacs. The female shoots, described by him as species of *Gristhorpia* and *Caytonia,* consist of an axis bearing two rows of short branches each of which carries an apical case containing seeds which is compared with the carpel (pistil) of a flowering plant (fig. 8A-C). These "carpels" differ from those of modern plants in being modified leaflets, and not formed from complete leaves. The male shoots, referred to the genus *Antholithus,* are of similar form and their branches bear clusters of four-lobed stamens containing winged pollen-grains. The fruits, first described from the Jurassic rocks of Yorkshire, contain closely packed seeds (fig. 8C); on the surface of the wall near the attachment of the fruit to its stalk is a stigmatic lip (fig. 8B) for reception of the pollen. Dr. Thomas instituted a new class, the Caytoniales (from a locality near Scarborough where the fossils were found) for these supposed primitive Angiosperms. Rhaetic and Jurassic floras have long been known to be rich in gymnosperms, particularly in Cycadophyta, but with the exception of a single leaf, which if it had been found in Cretaceous or Tertiary beds would have been referred to a Dicotyledonous plant, no evidence of the existence of the great class Angiospermae (flowering plants) had been furnished by the earlier Mesozoic floras. One of the attributes of angiosperms is the production of ovules, which after fertilization become seeds, in a closed vessel or ovary, a character implied in the name of the class (seeds contained in a case), in contrast to the naked seeds of conifers and cyads. It is at least certain that the Caytoniales which are represented in Rhaetic as well as in Jurassic rocks, are the most satisfactory examples so far discovered of extinct plants with a definitely angiospermous attribute. The abundance of angiosperms in some of the older Cretaceous floras and the rapidity with which they wandered over the world during the earlier stages of the Cretaceous period suggest that they must have been evolved long before they came to occupy the premier position in the vegetable kingdom. The primitive types of angiosperms probably differed widely in habit from those with which we are now familiar. *Sagenopteris* may be a pioneer of the present ruling dynasty, which having passed slowly through the earlier stages of evolution reached its full vigour in the early days of the Cretaceous period.

Conifers, though less prominent than Cycadophyta and ferns, were fairly numerous in Rhaetic floras; some were closely allied to living members of the *Araucaria* family; others such as *Stachyotaxus* with its yew-like foliage differed considerably in the fertile shoots from all recent species. Species of *Baiera, Ginkgoites* and other members of the Ginkgoales with leaves similar in form and in the structure of the epidermal layer to the "living fossil" *Ginkgo biloba,* are among the most abundant and widely distributed Rhaetic plants.

JURASSIC FLORAS

Samples of the vegetation prevalent in Jurassic times are scattered through the rocks from the far north in Franz Josef Land and Alaska to north and central Europe, Siberia, India, Japan, North America, and in Graham Land on the borders of Antarctica. One of the best known floras of the Middle Jurassic period is that preserved in the upraised sediments of estuaries which form the moors and cliffs of east Yorkshire In its main characters the Jurassic vegetation carried on the tradition which began in the latter part of the Triassic period and was further developed in the Rhaetic period. Many Rhaetic genera persisted; some new types were evolved, and a comparative study has shown that while the Rhaetic facies in its broad features was maintained there are certain characters by which Jurassic floras can usually be recognized. A brief comparison with the present vegetation of the fern-covered river-banks and the shrubs and trees on the deltas in the area that is now traversed by the Yorkshire cliffs, from north of Whitby to south of Scarborough, may enable us to realize the more striking contrasts between the present and the past. Then as now there were horsetails (*Equisetum*) forming miniature forests on the swampy ground: the plants were more robust and taller than their modern descendants, though they were smaller than their Triassic forebears. The reign of *Schizoneura* and *Neocalamites* was almost over: among the commoner plants were many which no longer occur in Europe: a botanist wandering over the deltas would be reminded of lands south of the equator: ferns such as *Dictyophyllum* and *Matonidium* would recall *Dipteris* and *Matonia;* he would also find species belonging to the Schizaeaceae, Gleicheniaceae, Marattiaceae, and Cyatheaceae, families no longer represented in the British flora and most abundant in warmer, southern lands. He would note the prevalence of species, some of them unfamiliar in the architecture of the fronds, agreeing in the structure of the spore-capsules (sporangia) with the royal fern (*Osmunda regalis*). He would also discover clumps of *Thinnfeldia* probably occupying drier ground, the fern-like fronds characterized by their stiffer leaflets without sporangia of the normal fern type. Passing to the taller shrubs and trees he would be struck by the abundance of stems bearing crowns of fronds of diverse form resembling in a greater or less degree the sago palms (cycads) of the tropics. On closer inspection he would find that the cycadean plants bore shoots similar in shape to the flower heads of the globe artichoke (*Cynara*), some of them unisexual, others with male and female organs on a single axis instead of the male and female cones of modern cycads. The great majority of these cycadean plants belonged to the Bennettitales, a group that has long been extinct, and not to the cycads in the narrow sense. Most of them were constructed on the ordinary cycad plan as regards the stem, but the type represented in the Rhaetic floras by *Wielandiella* persisted under a slightly different form into the Jurassic period. This aberrant Jurassic type was described by Dr. Thomas as *Williamsoniella;* it had a comparatively slender and forked stem bearing scattered leaves (*Taeniopteris*) more fern-like than cycadean in form, and in the angles of the forked branches bisexual "flowers" resembling those of *Wielandiella.* He would probably look in vain for oaks, elms, sycamores, the ash, alder, and other broad-leaved trees, though he might discover some plants which would puzzle him by the association of a strange type of foliage with flowers distantly related to those of some modern angiosperms. He would see cone-bearing trees reminding him of the Norfolk Island pine (*Araucaria excelsa*), trees with shoots like those of cypresses, the incense cedar of America (*Libocedrus*), and the Arbor vitae (*Thuja*); some with two-ranked leaves recalling the yews, the giant redwood of California (*Sequoia sempervirens*) and other conifers. The conifers as a whole would seem familiar, though the association in the North Temperate region of types that are now widely scattered in

warmer countries would afford an interesting topic of speculation on the vagaries of plant-dispersal. He would be surprised to find many trees exhibiting clear signs of relationship to the maidenhair tree (*Ginkgo*). From his knowledge of present-day vegetation he would have difficulty in assigning to their position in the plant-world such genera as *Sagenopteris, Thinnfeldia* and other legacies from older floras.

There were frequent though comparatively slight oscillations of the earth's crust in the course of the Jurassic period which are registered in the varying nature of the sedimentary rocks—series of beds rich in the shells of marine creatures associated with deposits formed in estuaries and lakes. The period is subdivided into stages grouped as Lower, Middle, and Upper Jurassic. A considerable interval of time separated the stages represented by the plant-bearing beds of Lower Jurassic age, such as occur in England on the coast of Dorset, from Upper Jurassic dirt beds (old surface-soils) near Lulworth cove in the same county. Beds intermediate in age are exposed on the Yorkshire coast. It is unnecessary to follow the changes in the rise and fall of individual species from the earlier to the later stages of the period; there were differences in detail, but the main features of the vegetation so far as we know remained fairly constant. Ferns, Cycadophyta, Ginkgoales and conifers continued to be the ruling dynasties from the Rhaetic through the Jurassic period.

Cretaceous Floras.—In the south of England and in some other parts of the world there is no sharp line of division between the last phase of the Jurassic period and the dawn of the Cretaceous period. In the Weald district of Kent and Sussex, in northern France, Germany and Belgium a series of fresh-water beds contains records of a time when rivers carried into a large lake logs of wood, twigs, leaves, and other samples of the vegetation which grew on the adjacent land. From the relics of this flora preserved in the cliffs at Ecclesbourne, near Hastings, on the south coast of England, and at other localities in western Europe it is possible to form a picture of the plant-world at the beginning of the Cretaceous period. The differences between this Wealden flora in northern Europe and the preceding Jurassic floras are comparatively slight: a few new forms are met with, for example a plant known as *Weichselia Mantelli* usually regarded as a fern with spreading fronds bearing small and thick leaflets; another fern *Onychiopsis psilotoides*, probably allied to the living genus *Onychium*, a member of the Polypodiaceae which is represented in the Far East and in other regions; also a fern of peculiar habit referred to the genus *Tempskya*, which may be a member of the Schizaeaceae, recorded from several European localities and from Montana; species of conifers agreeing in the needle-like leaves and in the cones with members of the family Abietineae which includes pines, firs, cedars, larches and other genera. The genus *Sagenopteris*, though not yet extinct, was much less in evidence in early Cretaceous than in Jurassic floras. In the Wealden vegetation of northern Europe there were no trees, so far as is known, other than conifers. The vegetation had still the Jurassic facies at least in the main. Reference has already been made to the structure of the fertile shoots of the Rhaetic genus *Wielandiella* and the Jurassic *Williamsoniella*, two examples of the extinct Bennettitales which in their comparatively slender, forked stems differ widely from all existing cycads.

One of the outstanding features of the early Cretaceous floras is the abundance of cycadean plants, a feature also of Jurassic vegetation. Most of the stems are of the type known as *Cycadeoidea;* the splendid specimen (fig. 9) from Upper Jurassic rocks of southern England, *Cycadeoidea gigantea*, agrees closely with stems of some modern cycads in its bulky form and in the closely packed persistent bases of old leaf-stalks which give a characteristic appearance to the plant. This species differs from most examples in the absence of fertile branches. The first typical representative of the genus is one described by Carruthers from Lower Cretaceous beds in the Isle of Wight named *Bennettites Gibsonianus* and now included in *Cycadeoidea*. Embedded among the leaf-bases are several lateral branches bearing a terminal "flower" and numerous short, linear leaves. In this species the flowers appear to be unisexual and female. The discovery in Dakota and in other districts in North America of hundreds of stems preserved in wonderful perfection supplied material which was described by Dr. Wieland in two well-illustrated volumes. Some of the stems are unbranched; others consist of several tuberous branches. A remarkable feature is the extraordinary abundance of fertile shoots on a single stem. The flowers are usually bisexual, some bearing male and female organs which were apparently functional; others with female organs only and with scars showing the former presence of male organs. A fertile branch ends in a depressed dome or in a tapered cone (fig. 10A) covered with two kinds of appendages, fertile ovule-bearing or seed-scales, each surrounded by a rosette of sterile inter-seminal scales with swollen, flat tips (fig. 10B) forming a protective layer over the whole "fruit." Below the female portion was a circle of 10–20 pinnately branched stamens bearing rows of compound sporangia (pollen-sacs) with numerous pollen-grains. The stamens were at first infolded round the flower-axis; after expanding and shedding the pollen they fell off. The fertile branch bore numerous hairy bracts, which surrounded a conical axis, bearing short female organs (ovuliferous scales) and interseminal scales enclosed by a series of infolded leaves (stamens) bearing rows of compound sporangia (pollen-sacs). The seeds contained an embryo with two cotyledons. The male organs may be compared on a small scale with the fertile leaves of modern ferns of the family Marattiaceae; while the female organs are of a type that is peculiar to the Bennettitales (*e.g., Wielandiella, Williamsoniella, Williamsonia, Cycadeoidea*). The largest example of a flower so far recorded is one described by Dr. Marie Stopes from Lower Cretaceous beds in the Isle of Wight which produced thousands of small seeds on a single "fruit." *Cycadeoidea* in its reproductive apparatus differs fundamentally from existing cycads though in the form and structure of the stem it is similar to them. It has been suggested that the general resemblance of the bisexual flowers to those of a magnolia may be an expression of actual affinity and that the angiosperms, which replaced the Cycadophyta as the ruling dynasty in the early days of the Cretaceous period may be connected with them by descent. The chief difficulty in the way of accepting this view is the lack in the flowers of the Bennettitales of any structure definitely comparable with an ovary. A few leaves discovered in strata on the Atlantic border of the United States of America, in the so-called Potomac series the lowest members of which are approximately equivalent to the English Wealden series, bear some resemblance to those of certain modern flowering plants; but their precise nature is uncertain. On the other hand Lower Cretaceous beds along a strip of the west Greenland coast on Disko island, on the coast of the adjacent mainland and on Upernivik island (Lat. 71° N.) have yielded several Wealden species. A species of *Ginkgoites*, ferns allied to *Matonia* and *Dipteris*, several forms of *Gleichenites*, closely allied to tropical and sub-tropical Gleichenias and to fossil members of the family recorded from Jurassic rocks, also some Wealden species of gymnosperms, associated with many leaves practically identical in form and venation with those of living flowering plants. Plane trees, magnolias, oaks, also leaves described as *Dalbergites* because of their striking resemblance to the foliage of the tropical genus *Dalbergia*, a member of the Leguminoseae It is significant that in no other part of the world do we find a greater abundance and variety of angiosperms preserved side by side with ferns and gymnosperms, which appear to be specifically indistinguishable from Wealden species from northern Europe, North America and many other parts of the world. It would seem, therefore, that many of the broad-leaved trees may have had their origin in the early days of the Cretaceous period on an Arctic continent whence in later times they spread farther and farther towards the south.

It is worth while to consider in rather more detail the nature of the vegetation which flourished in Greenland in the earlier stage of the Cretaceous period. We have already commented on the luxuriance of the Rhaetic flora of Scoresby Sound in east Greenland; the Lower Cretaceous flora has been partially reconstructed from specimens obtained from beds on approximately the same latitude (Lat. 70–71° N.) on the opposite coast. Another question

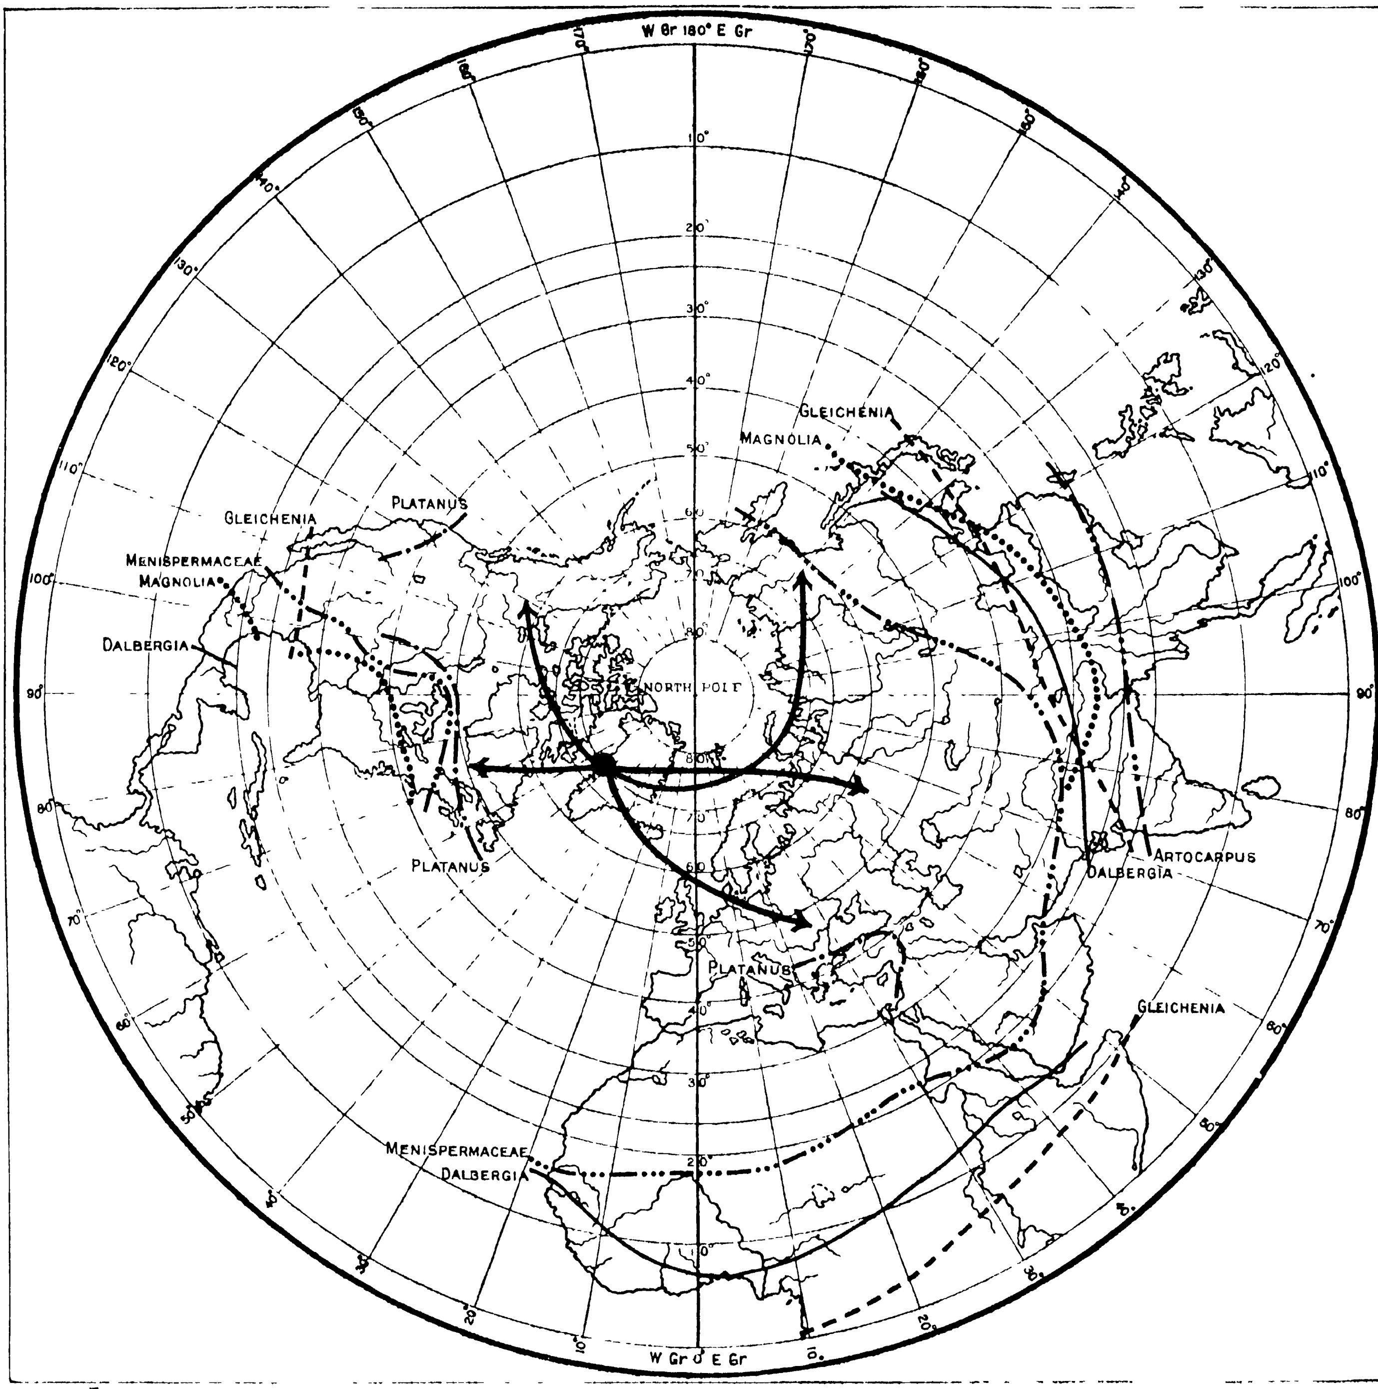

FIG 12 - MAP OF THE NORTHERN HEMISPHERE SHOWING ON THE WEST COAST OF GREENLAND THE DISTRICT WHERE A RICH LOWER CRETACEOUS FLORA HAS BEEN FOUND
The arrows indicate a Southern Migration of Arctic Cretaceous plants The present northern limits of families and genera represented in the Greenland Cretaceous flora are shown by the various lines

of great importance and of no little difficulty is the apparently sudden transformation of the older Mesozoic vegetation, in which flowering plants played little or no part, into what we may call a vegetation that is entirely modern in its dominant characters. The only indication in Rhaetic and Jurassic floras of plants foreshadowing angiosperms in the nature of their reproductive organs is furnished by the Caytoniales From Lower Cretaceous rocks in England above the Wealden series Dr Marie Stopes described some highly specialized types of dicotyledonous wood which cannot be regarded as primitive. It is therefore certain that angiosperms had reached an advanced state of development at a comparatively early stage in the Cretaceous period.

The salient features of the west Greenland flora may be briefly summarised as follows: Species of *Gleichenites* were the chief representatives of the ferns; they agree closely in the forking of the frond axis, in the structure of the spore-capsules, and in the anatomy of the leaf-stalk with existing species of *Gleichenia* Among other ferns are *Laccopteris*, a genus that in the form of the fronds and in the structure of the sporangia bears a striking likeness to *Matonia; Hausmannia* closely allied to *Dipteris;* species of *Sphenopteris* and *Cladophlebis* which have not as yet been assigned to a definite position in relation to living species The Cycadophyta are represented by plants bearing leaves having the characters of *Pseudocycas, Ptilophyllum* and *Otozamites* genera which played a prominent part in Jurassic floras The fronds known as *Ptilophyllum* are characterized by two rows of linear segments giving them an appearance similar to that of the Mexican cycad *Dioon; Otozamites* fronds are distinguished by the eared base of the segments which are occasionally relatively broad. Trees with leaves like those of *Ginkgo* were abundant in the Arctic forests and with them were other members of the Ginkgoales Conifers were represented by species believed to be akin

to *Araucaria* and *Agathis* of the southern hemisphere, by members of the cypress family, relatives of the sequoias of California, at least one species of Abietineae, and by several conifers with leaves resembling in structure those of the umbrella pine (*Sciadopitys*) of Japan. With these were associated several species of dicotyledons surprisingly modern in the pattern of the foliage: in addition to the genera previously mentioned special attention is drawn to *Artocarpus,* the tropical bread-fruit tree. The occurrence of leaves agreeing closely in venation with those of the cinnamon tree (*Cinnamomum*) and of members of the Menispermaceae, a family of flowering plants that is now characteristic of tropical and warm temperate countries, affords further evidence of unusual climatic conditions in the Arctic regions (Map, fig. 12). We cannot believe that the evolution of the flowering plants was a sudden event. The oldest known angiosperms so far discovered must be the descendants of a line of ancestors stretching far back into the earlier stages of the Mesozoic era.

Conclusion.—A comparative study of the records of plant-life shows that the character of the vegetation was fundamentally changed during the later stages of the Palaeozoic era; a few of the older types survived, but most of the plants which flourished in the Coal age disappeared. By degrees as the Triassic period advanced, ferns of modern aspect increased rapidly in number and displaced the Pteridosperms from their position of dominance. The seed-bearing fern-like plants were by no means extinguished but they were overshadowed by the gradual rise to power of the Cycadophyta, the Ginkgoales, and other groups. The next great change in the plant-world was at the end of the Jurassic period and at the beginning of the Cretaceous period when the present dominant class, the angiosperms, began to assert its ascendancy and the floras became modified "as by a new creation." It is impossible to follow in detail the progress of evolution during the Cretaceous period as a whole. The important point is that at the beginning of the period flowering plants were small in number or entirely absent; this is the conclusion based on the very incomplete data at present available. In the Lower Cretaceous floras of Greenland, North America, Bohemia and Sakhalin Island in which dicotyledons first appear in quantity there were also several representatives of gymnosperms and ferns which had survived from the Jurassic period. As we ascend to the higher divisions of the Cretaceous period the floras become more modern and the chief differences between them and those of our own day are geographical rather than botanical. The floras of North America and Europe, for example, agree much more closely with present-day floras in sub-tropical or even tropical lands than with the plant associations which now occupy the territory where the fossils have been found. The problem of climatic change raised by the Cretaceous vegetation of Greenland has still to be solved. On the accompanying map (fig. 12) the northern limit of distribution of some of the families and genera is roughly shown. If we assume that the Greenland Cretaceous species grew under conditions similar to those which govern the life of their present-day relatives, it follows that the climate must have been at least as warm as that in the Mediterranean region at the present time. It is certain that the Cretaceous vegetation could not have endured the hardships imposed on the present Arctic floras; but it is by no means certain that extinct species of living genera could not have existed under conditions which would be fatal to their modern descendants. The past is in many respects the key to the present; but it is dangerous to carry this principle too far.

From the broken fragments of plants preserved in the sedimentary rocks of the Mesozoic periods we have been able to reconstruct a few of the links in the middle portion of the chain of life and to follow the varying fortunes of certain groups and families through successive ages. The history of the plant-world may be compared with that of human races; for a time one race holds sway over a widening territory unchecked by serious competitors until, with apparent suddenness, a more efficient stock asserts itself and the balance of power is disturbed. In the contrast between the vegetation of the Cretaceous period and that characteristic of the earlier stages of the Mesozoic era we have one of the most impressive illustrations of the revolutionary aspect of evolution presented by the records of the rocks.

TERTIARY PLANTS

Introduction.—The great geological divisions into Primary, Secondary and Tertiary eras are based chiefly upon the observations of marine strata and marine organisms. The reason for this classification lies in the fact that oceans are more continuous than land, and sea organisms therefore present a more universal basis for classification than land organisms. But changes in land life do not always coincide with changes in marine life, and for this reason a different grouping of geological periods is better for the study of plants. The last great phase in the development of plant life is the coming in of flowering plants. Tertiary botany is chiefly concerned with the history of these; but for their origin we must go back to the Cretaceous.

With the advent of flowering plants the age of world-wide floras is left behind. From this time onwards plants are grouped into localized floras comparable with those of the present day.

Mode of Occurrence of the Plants.—Hardly ever has a whole fossil plant been found with its parts in association. Not uncommonly fruits containing seeds, and leaves attached to stems occur. Thus material available for the study of Tertiary plants is fragmentary. Most of the determinations are based on leaves, fruits and seeds, but there are notable exceptions. In the Baltic amber various delicate organs are preserved. Pollen has chiefly been studied from the Quaternary peat of northern Europe.

Tertiary and Quaternary plant deposits are formed in various ways. Sometimes the portions of the plants are embedded in the silts of ancient lakes, as in central France, Switzerland, and the

Rocky mountains; sometimes in the silts of rivers, as in the beds formed by the old Rhine; or sometimes in the brackish water silts of estuaries, as in the beds of the Hampshire (England) coast. Again plant deposits may be the accumulations of swamps, *e.g.*, the brown coal of Germany; or of successive layers of vegetation occupying the same spot, like the peat of northern Europe. Yet again plants may be buried by volcanic ejecta, as has happened in Scotland, Ireland and central France. Or they may have become entangled in resin, as has happened in the case of the Baltic amber. It is from such scattered information, overlapping now in one place, now in another, that the history of Tertiary plant life in Europe is pieced together. Whatever the mode of origin, there are corresponding differences in the kind of matrix, in the parts of the plant preserved, and, generally, in the components of the floras.

Leaves usually occur in fine clay or tufa, and most frequently as mere impressions showing more or less clearly the form and nervation; but, in the case of coniferous and evergreen leaves, not infrequently part of the carbonized leaf itself is preserved covered by its tough cuticle. Delicate winged and pappus-bearing fruits and seeds also occur in fine clays. Other fruits and seeds, also wood, are found embedded in coarse material such as sandy clays, sands and loam, and in peat. Usually if carbonaceous substance is present, it is impregnated with mineral matter. If, as is common, this is iron pyrites, the close intermixture of hard pyrites with rotten carbonaceous matter makes it difficult to examine the objects by sectioning. Sometimes the carbonaceous substance is entirely replaced by silica or calcite, when sectioning becomes possible.

Methods of Study.—Different organs being differently preserved, each part of the plant requires a special method of study. Leaf impressions require no preliminary treatment beyond exposing any part concealed. When the leaf-blade is preserved, a fragment must be chipped off with a knife and, by treatment with nitric acid and chlorate of potash followed by ammonia, the cuticle can be isolated, mounted on a microscope slide, studied and photographed. Winged and pappus-bearing fruits and seeds must be studied in the same way. Other fruits and seeds are isolated by disintegrating the matrix. This may be done by boiling the seed-bearing material in a strong soda solution, or warming in a 10% solution of nitric acid over a water bath. The dissolved matrix is then strained off through sieves, leaving the fossils behind. These can be examined as free entities. In the investigation of pollen grains the material is boiled with a 10% solution of caustic potash. Wood, being large, is usually picked out of the matrix with a knife or other instrument, and, if possible, sectioned and studied microscopically.

The number of living species is so great, and the required knowledge so detailed, that rarely does a worker attempt more than one branch of the study. All workers have one initial need in common—as complete a collection as possible of those parts of the living plant they wish to study. Ideally, all living species should find place in the collection, and the material should be arranged so as best to suit the particular branch of study. The arrangement of public herbaria is usually not very suitable for palaeobotany. The reason lies in the method of classification of living plants. This is based principally on the arrangement of the floral organs, although other organs play a subsidiary part. In consequence all collections of dried plants, and all books dealing with classification, are arranged on this basis, and afford no ready key to the palaeobotanist, as they do to the botanist. For the former the organs he studies have always to be re-classified. All great herbaria provide abundant material for the study of leaves, but not for that of other organs. Fruits and seeds are badly represented, and there is great need for better collecting of these organs.

Either from collections or illustrations, the student must gather all possible material for comparison. But the living material is the most important. He must examine the fossil and living part in detail, using the microscope. Stress is laid on the comparison with living material, for sometimes palaeobotanists have been content to follow the easier course of comparing with previous determinations only. But on the exact comparison with living plants depends our knowledge of the relation of fossil species to living ones.

Scope of the Study of Tertiary Plants.—Tertiary plants furnish some of the later chapters in the history of living plants, and of the world; the latest of all being found in the Quaternary. They give the most reliable information obtainable about the ancestors of the living forms; where they lived and what their various organs were like. That is to say, what changes in distribution and structure they have undergone, or, on the other hand, what stability they may show. They give also the best information obtainable as to past climate.

In the early stages of the period we can trace no living species, but some species are sufficiently close to living ones to be placed in living genera. Others which cannot be placed in living genera may yet be placed in living families. Nevertheless, until the close of the Tertiary period, plants constantly occur whose living relations have not been discovered. Whether this is because the plants have become extinct and left no link with the present, or because our knowledge of living plants is inadequate to trace their relations is difficult to tell. Probably both causes operate. It is certain, however, that old forms more remote from the living have yielded place to newer forms closer to the living; so that by the end of the Tertiary period (latest Pliocene) all known fossil floras are composed, almost exclusively, of living species, although the geographical distribution of these may have changed in the interval.

The study of a succession of floras in a given region, say western Europe, shows clearly that changes occur in their components from age to age. Further, that the components of the successive floras are related to those of living localized floras; now to a tropical, now to a warm-temperate flora, and so on.

But living plants are grouped into localized floras largely under the influence of climate. Adverse climatic conditions will kill developed, *i.e.*, rooted, plants. Whole species, or even genera would be killed out, were it not that plants have an inherent power of movement in their embryo stage—the seeding stage. If the members of a species can cast their seed beyond the range of the adverse conditions, that species may survive. If not, it must die. But for survival, the change of climate must not overtake its rate of travel, and there must be a suitable habitat within reach. That plants continually try to occupy fresh ground is shown by the rapidity with which they spring up on waste land (Krakatoa after the earthquake, Flanders during the war). That they fail to establish themselves, if the ground is already occupied by a healthy population, is shown by the rarity with which introduced plants are able to establish themselves among a native flora. It is largely by movement under changing climate that in process of time plants have been grouped into the existing local floras. Under a change from heat to cold the movement will be from higher to lower latitudes and from higher to lower altitudes. Under a change from cold to heat it will be in the reverse directions.

In considering the results which have accrued from the study of Tertiary plants, we propose to divide the subject under three heads belonging to the three great geographical regions in connection with which most of the work on Tertiary plants has been carried out. These regions are Europe, North America and the Arctic. The work on the Tertiary plants of all other parts of the world is, as yet, too scattered and too scanty to admit of treatment in a short article. Space does not permit of more than a general indication of the characters of the floras which succeeded one another in the three regions during the long Tertiary ages—probably some tens of millions of years. For fuller knowledge readers must consult the bibliography. Much of the older work needs revision, chiefly because the knowledge of the plants of the Far East—just those with which Tertiary plants are most closely allied—has increased so greatly during this century. In view of this increase in knowledge we illustrate the fossil floras of the various periods, where we can, by the latest work, provided the floras are large and their age well established. There is an additional advantage in so doing because the later works give references to the more important older works.

Typical Plant Deposits

Era	Age	Europe	America, *Am.;* Arctic, *A*
Quaternary	Historic	Roman, Celtic, etc.	
	Neolithic	Peat of north Europe Dogger Bank peat, "Submerged Forests"	
	Palaeolithic	Post-glacial, arctic Interglacial, warm Preglacial, arctic	Eastern Canada and eastern U.S.A.
Tertiary	Pliocene	Cromer Forest bed Mougoudo, Reuver	Citronelle, *Am.*
	Miocene	Brown Coal, Oeningen	Florissant, *Am.*
	Oligocene	Aix Bembridge, Baltic amber	Catahoula, *Am.;* Alum Bluff, *Am.*
	Eocene	Hordle Bournemouth, London clay Sezanne, Gelinden	Green River, *Am.* Wilcox, *Am.;* Spitzbergen, Greenland, *A.*
Secondary	Cretaceous	Plant beds of Saxony, Bohemia, Portugal	Laramie, *Am.* Dakota, *Am.;* Potomac, *Am.;* Kome, *A.*

CRETACEOUS AND TERTIARY PLANTS OF EUROPE

The plant deposits of Europe, though numerous, are usually of limited extent and confined to small areas. When intercalated with marine beds the geological age may be clear; but frequently this does not happen, and then the age is doubtful, unless the deposits contain the remains of land animals, which sometimes help in correlation.

Cretaceous.—Flowering plants when they appear in Lower Cretaceous rocks, are represented, in Europe, by a few scattered specimens of very doubtful affinity; a few species represented by leaves, from Portugal, or wood, from England and so forth. As time progresses the remains become more frequent, but floras still retain their predominant Secondary character.

By the Upper Cretaceous, flowering plants begin to dominate, and from various parts of central Europe a considerable number of species have been recorded. In Bohemia, besides conifers and ferns, there occur many dicotyledons. *Credneria* is a genus of unknown affinity, but other plants have been referred to living genera. Such are *Myrica, Ficus, Quercus, Eucalyptus, Pisonia, Phillyrea, Rhus, Prunus, Bignonia, Laurus, Salix, Benthamia.* But without the evidence of fruits or flowers in support, it is difficult to believe that so many living genera existed.

After the Cretaceous there was an interval of unknown duration not represented by deposits in Europe. The Tertiary period which followed witnessed great changes in the physical geography of the continent. The great mountain-chains which span Eurasia were uplifted. As we shall see later this has had an enormous influence on the plant life of these regions ever since. In addition to mountain-building, there was also great volcanic activity in various parts. It is customary to divide the Tertiary into four periods: Eocene, Oligocene, Miocene, Pliocene.

Eocene.—The earliest Eocene, the Paleocene, is not represented in Britain, but is found on the Continent in the north-east of France, and in Belgium. The flora is still close to that of the Upper Cretaceous, and indicates similar warm-temperate or subtropical conditions. Count G. de Saporta recorded from Gelinden, near Liége, species of oak, chestnut, laurel, cinnamon, camphor, *Litsea* and *Persea;* also members of the *Araliaceae, Menispermaceae, Celastraceae* and *Myrtaceae* families. From tufa formed by an ancient waterfall at Sezanne he recorded, besides a profusion of ferns, genera of *Lauraceae, Tiliaceae, Meliaceae, Sterculiaceae;* also *Symplocos, Artocarpus* (the bread-fruit), *Magnolia,* hazel, alder, willow, viburnum, cornel, fig, ivy and vine; but nearly all the European genera show an exotic character. From the Paleocene near Paris, Watelet recorded *Araucaria,* bamboo and palms.

Later in age are the Woolwich and Reading series of England from which a small but interesting flora suggests a rather more temperate climate than that which preceded or followed it. Leaves of plane are abundant, and among the plants recorded are *Robinia,* a palm, two figs and a laurel. C. von Ettingshausen and J. Starkie Gardner who worked on the beds, recorded two ferns, *Aneimia* and *Pteris;* and two gymnosperms, *Libocedrus,* related to the American *L. decurrens,* and a species of swamp cypress, *Taxodium europaeum.*

The Oldhaven beds which follow have yielded fig and cinnamon. None of these beds have as yet been fully investigated, and the evidence is too scanty for a correct inference as to climate.

The deposit next in age in England to which we must refer is the London Clay. It is the most important plant bed of Lower Eocene age in Europe. The fruits and seeds are very abundant and beautifully preserved. For more than two centuries they have attracted attention. In 1840 Dr. James Scott Bowerbank published an admirable study of some of them, but the work was never finished. His botanical knowledge was inadequate to allow him to determine the species. In 1879 Ettingshausen made a very hurried study of Bowerbank's material, and published a list of plants, but without any evidence to support his determinations Critical examination of the same material by the writers, who are now engaged upon its study, proves that his work was faulty in the extreme and valueless. The work of revision is not completed, but it may be stated that, with the exception of a few representatives of sub-tropical genera, the affinity of all is tropical. Scarcely any of the genera have living representatives in Europe. The Nipa palm was one of the commonest species. In the present era it abounds on the margins of estuaries and lagoons in the tropics of east Asia. Other palms are common, and families wholly tropical find representation. It can scarcely be doubted that the climate of Britain was tropical, or nearly so, when the London Clay was deposited.

Similar evidence of tropical conditions comes from the Paris basin where, amongst other plants, numerous palms occur, including *Nipa; Ottelia,* a tropical water-plant of the Old World is also found. Saporta pointed out the further evidence for tropical conditions shown by the scarcity of caducous leaves, an absence which indicates the non-occurrence of seasonal changes. The middle Eocene of the Bournemouth beds (Hampshire) still shows something of a tropical character. The flora is as yet incompletely known, but Dr. Helena Bandulska has begun in connection with it, one of the few systematic studies of leaf-cuticles that has been made. Isolated cuticles have frequently been studied, but the systematic examination of living species is but begun. It may prove of great value. The Nipa palm (determined from fruits) flourished, also such tropical genera as *Aniba, Litsea* and *Neolitsea;* but somewhat cooler conditions may be evidenced by *Lindera* and *Nothofagus.* Gardner and Ettingshausen had previously recorded many ferns, also conifers including *Araucarites.*

We must draw attention to a curious and important fact. It has been noted that the flora of the London clay was exotic. All Tertiary floras continued to be so in a large degree until towards the end of the period. At first even the families were mainly exotic. Gradually European families came in, but the relationship of the genera was exotic. Then European genera began to appear, but the relationship of the species was exotic. Lastly, at the end of the Pliocene the whole flora was transformed to one of European species. Stated in another way: A flora of European relationship gradually replaced one of exotic relationship, which died out.

The relationship of the dying flora is very remarkable. In the Eocene it was more or less world-wide, but with a marked leaning to plants of the Far East. In floras later than the Eocene the relationship contracts. African affinities nearly disappear. Plants with relations in the Far East predominate. Next in order come North American and Mediterranean plants; then Australian, in spite of the fact that the Far East and America are so far, and the Mediterranean so near. Yet another way of stating the same fact is, that a type of flora which was gradually killed out in Europe, survived largely in the Far East and in America, and only in a very small degree in the Mediterranean. The parts of the Far East in which the living allies are found are Japan, China, Burma, further India, the Malay Peninsula, Malay Islands, Formosa, the Philippines; also Australia. In a general way as time passed the relationship passed northward from Malaya to Japan and China, and from the West Indies through the United States to Canada.

The upper Eocene of Hordle (Hampshire), the flora of which was described by M. E. J. Chandler, has yielded the conifers *Sequoia* (related to the red-wood) and pine. In addition there occur among flowering plants such tropical or sub-tropical genera as *Broussonetia, Chlorophora, Gordonia, Iodes, Meninspermum, Natsiatum, Nipa, Orites, Phellodendron, Symplocos, Zanthoxylon,* and various vines. Among genera which now range into Europe are *Corydalis, Liquidambar, Styrax,* as well as the blackberry, elder and persimmon.

Oligocene.—In the succeeding Oligocene the change of flora is comparatively slow. The flora of the Bembridge beds (Hampshire) of Early Oligocene age, has lately been studied by E. M. Reid and M. E. J. Chandler. It contains a few tropical and subtropical genera such as *Epipremnum, Neolitsea, Phyllanthera, Radermachera, Tylophora,* but plants of a cooler range are also common; *Araucarites, Catalpa, Cinnamomum* (the cinnamon), *Engelhardtia, Incarvillea, Libocedrus, Sabal* (the palmetto), and numbers of genera which now have representation in Europe: Bulrush, bur-reed, pond-weeds, water-soldier, sedge, beech, oak, hornbeam, clematis, buttercup, poppy and *Acanthus.*

A flora of somewhat the same age is preserved in the Baltic amber. Reference has already been made to its mode of preservation. The plants include the amber-pine itself, from which the resin dripped, enclosing insects, leaves, twigs, wood, flowers, seeds and hairs. Many of the flowers closely resemble living forms. Among exotic genera are two palms *Phoenix* (the date-palm) and *Sabal, Clethra, Dalbergia, Deutzia, Ephedra, Hammamalis, Hibbertia, Magnolia, Stuartia, Trianthera* and *Ximenia.* Among European genera are *Daphne, Erodium, Geranium, Loranthus, Amarantus, Myrica, Smilax* and *Thesium,* besides oak, chestnut, beech, willow, polygonum, flax, maple, holly, buckthorn and wild-parsley. Probably this list needs revision. It will be noticed that a great number of these genera have not appeared in previous lists, and will not appear in later ones. The amber flora offers a good example of the selective process which accompanies different kinds of preservation.

One of the largest known fossil floras belongs to the Oligocene, that of Aix in Provence. It was determined by Saporta. It comes from the bed of an old lake The lake itself long continued in existence, and the life around and within it suffered many vicissitudes whilst the region was convulsed by the earth movements and volcanic activity of the time, although no very great change took place in the flora from beginning to end. Some of the exotic families represented are *Bignoniaceae, Proteaceae* and *Sapotaceae* Among exotic genera are *Aralia, Ailanthus, Bombax, Leucothoë, Magnolia, Sapindus, Sterculia, Zanthoxylon.* Several conifers and palms occur. *Lauraceae* are represented by cinnamons and camphors. Among European genera are *Arundo, Daphne, Smilax* and *Styrax,* bur-reed, bulrush, pond-weeds, alders, birch, oak, fig, poplar, willow, laurel, jasmine, olive, oleander and persimmon.

Miocene.—One of the earliest described and most famous of Tertiary floras was obtained from the silted up lake of Oeningen in Switzerland. From this Oswald Heer recorded hundreds of species. As his work needs revision, it will be better to take as a type of a Miocene flora the almost equally famous brown-coal of central Europe. Much recent work has been done on brown-coal material derived from various localities by the late Dr. P. Menzel and Dr. R. Kräusel. Numerous conifers are found—*Sequoia, Taxodium,* and *Glyptostrobus.* The walnut family is strongly represented by American and Asiatic forms. Catkin-bearing trees are abundant. Among exotic genera are *Ampelopsis, Acanthopanax, Aralia, Cinnamomum, Elaeodendron, Lindera, Liquidambar, Magnolia, Persea, Symplocos.* Among European genera are *Cotoneaster, Paliurus, Sorbus, Spiraea, Trapa, Zizyphus,* plane, plum, hawthorn, blackberry, maple, *Euonymus,* holly buckthorn, lime and ash. In this flora are found forms so near the living as to be named as mere varieties. It must be remarked, however, that genera found in Europe are still often represented by species of exotic relationship.

The transition from Miocene to Pliocene is well represented in the old volcanic region of central France. E. M. Reid has described from fruits and seeds a late Miocene (or Mio-Pliocene) flora from Pont-de-Gail. Among alien genera are *Actinidia, Amethystia, Cleomella, Clerodendron, Ehretia, Epipremnum, Magnolia, Meliosma, Menispermum, Phellodendron, Polanisia, Symplocos, Trichosanthes.* All are of east Asian or American affinity. There are besides numbers of European genera which cannot here be named.

Pliocene.—The Lower Pliocene flora of Mougoudo (Cantal) is a little newer. It was examined by Prof. L. Laurent who recorded exotic *Lauraceae, Rhamnaceae* and *Malvaceae,* also *Zelkova, Abronia, Cissus, Grewia, Sterculia* and *Paulownia.*

The largest known Lower Pliocene flora is the Reuverian from the Dutch-Prussian border. It was studied by Prof. Laurent and by C. and E. M. Reid. Among exotics are *Actinidia, Araucaria, Aralia, Brasenia, Carya, Epipremnum, Euryale, Glyptostrobus, Karwinskia, Magnolia, Meliosma, Menispermum, Myrsine, Nelumbium, Nyssa, Phellodendron, Proserpinaca, Pseudolarix, Pterocarya, Sequoia* and *Zelkova,* besides many others. European genera are now numerous. Many living species occur, some of them European.

Similar evidence comes from the Rhone valley where M. l'abbé Georges Depape has recorded *Buettneria, Carya, Cinnamomum, Diospyros, Ginkgo, Glyptostrobus, Laurus, Liquidambar, Liriodendron, Oreodaphne, Persea, Pterocarya, Sapindus, Sassafras, Torreya, Zanthoxylon* and *Zelkova,* amongst exotic genera.

In the Middle Pliocene a great change occurred in the European flora. Very rapidly the old exotic plants disappeared and European plants took their places, almost with a rush. In the flora of Tegelen (Holland) but a few stragglers of the exotic genera remain: *Actinidia, Dulichium, Euryale, Magnolia, Phellodendron, Pilea* and *Pterocarya.* 84% of genera were European and 82% were represented by allies of European species. By the close of the Pliocene, *i.e.*, the end of the Tertiary period, the Cromer forest-bed flora shows an almost exclusive European alliance The old flora had gone.

CRETACEOUS AND TERTIARY PLANTS OF NORTH AMERICA

As distinguished from the European, the Tertiary flora of North America is characterized by the continuity of the great bulk of its elements from past to present, with only such changes as have attended evolution and plant migration within the continent; some of the more tropical forms having sought refuge in South America When alien elements occur they show alliance with the Tertiary plants of Europe, or with the living plants of the Far East, and in a lesser degree with those of Africa and the Mediterranean. The alliance with the Far East continues to the present day, as Asa Gray and the late Prof. C. S. Sargent have pointed out. Hence the living flora of America is linked with the extinct Tertiary flora of Europe, and with the living flora of the Far East.

The Cretaceous and Tertiary plant deposits of North America present a magnificent series, often covering extensive areas They may be divided into three chief groups: (1) The deposits of the southern and south-eastern coastal plains, a series studied by Prof. E. W. Berry. These show an ordered succession of strand floras of very similar character which lived under similar conditions, and are therefore closely comparable from age to age. They are dated by intercalated marine strata. (2) The deposits of the

eastern coastal plain; those of Cretaceous age being the most important. (3) The Rocky mountain group where a scattered series of continental deposits occurs, some of them having been formed, as were many in Europe, under the influence of mountain-building and volcanic action. The beds, like similarly isolated beds in Europe, are of somewhat doubtful age, but Cretaceous, Eocene and Miocene strata appear to be represented. The flora is of an inland type.

Cretaceous.—The Cretaceous witnessed in America, as in Europe, the passing of the flora of secondary type and the incoming of flowering plants. Conifers, cycads and ferns were still largely represented, but they diminished in number, and the older forms died out. The flowering plants of the Lower Cretaceous were markedly different from those of the present day. They are referable to living families, but only a few, such as fig and sassafras, to living genera. In the Upper Cretaceous, the flora became richer and more varied. It indicates a mild climate without seasonal changes. In the coastal beds of the south and from beds of similar age, which extend through Alabama and New Jersey and are found in West Greenland, a rich flora is found in which figs, willows and magnolias are predominant. From the Dakota Sandstone Leo Lesquereux described a considerable number of genera, among which may be mentioned *Aralia, Cinnamomum, Eucalyptus, Ficus, Ilex, Inga, Juglans, Laurus, Magnolia, Nyssa, Paliurus, Pinus, Populus, Quercus, Sassafras, Sequoia, Sterculia, Zizyphus.* These also indicate mild conditions.

The latest Cretaceous is found in the Laramie formation of the Rocky mountain group. The strata were laid down in a great inland sea which was gradually drained by the elevation and silting up of its bed. Coal seams indicate long persistent swamps and lagoons. In his study of the flora, the late Dr. F. H. Knowlton named ferns, the conifers *Dammara* and *Sequoia,* and, among flowering plants, *Anona, Ceanothus, Cercis, Hicoria, Magnolia, Nelumbium, Pistacia, Sabal, Zizyphus,* as well as species of walnut, willow, poplar, oak, bread-fruit, fig, ivy, holly; but many of the plants can only be referred to families; their more exact relationship being uncertain.

Eocene.—The Eocene saw a sudden development of modern types. Almost all the plants are closely allied to those which inhabit the warm regions of the earth. Even when genera range into cooler regions they are, in almost every case, represented in the tropics also. The largest Lower Eocene flora is the Wilcox flora described by Berry. Most of the plants are tropical or subtropical, a few are allied to temperate forms. Among genera are *Acacia, Anona, Aralia, Artocarpus, Avicennia, Banisteria, Bumelia, Canavalia, Canna, Carapa, Cassia, Cedrela, Celastrus, Chrysobalanus, Cinnamomum, Coccolobis, Combretum, Dalbergia, Dodonaea, Drypetes, Engelhardtia, Fagara, Ficus, Fraxinus, Glyptostrobus, Guettarda, Ilex, Inga, Juglans, Laurus, Magnolia, Maytenus, Myrica, Nectandra, Nyssa, Oreodaphne, Oreopanax, Osmanthus, Paliurus, Persea, Pisonia, Pistia, Pithecolobium, Planera, Porana, Prunus, Quercus, Reynosia, Rhamnus, Sapindus, Sideroxylon, Simaruba, Sophora, Sterculia, Taxodium, Trapa, Zamia, Zizyphus.* It is to be noted that some of these genera such as *Glyptostrobus, Laurus, Oreodaphne, Paliurus, Porana, Sideroxylon* and *Trapa,* are now confined to the Old World.

The Green river beds of the Rocky mountain group belong to a later Eocene age. Knowlton, who revised the flora in 1924, stated that there is an overwhelming preponderance of species with living allies in tropical and sub-tropical regions. He tentatively divided the species into lowland and upland forms. The flora is not a large one. Among the lowland forms he named species of palm, a relation of the banana, and *Brasenia* (a species of water-lily), besides other genera which are the same as some recorded from the Wilcox beds.

Oligocene.—The Oligocene is not well known from America. From the coastal region Berry has described several small floras. Among them are those of the Alum Bluff beds and the Catahoula Sandstone. Like so many Oligocene floras in Europe the constituents show mixed relationships. Some, such as palms, show alliance with tropical forms. Others, like *Ulmus, Rhamnus* and *Paliurus,* with cooler forms. Berry concludes that the Oligocene period in America was warmer than the Eocene, although this is open to doubt, for the Oligocene floras are too small to be representative; while the Eocene floras also show a large preponderance of tropical forms. In Europe the Eocene was undoubtedly the warmer period.

Miocene.—The Miocene in the south is known only from small floras. Temperate forms mingle with those of a more tropical type, as they do in Europe, indicating a cooler flora supplanting a warmer one, under the influence of a changing climate. The climatic conditions appear to have been very similar to those of the same regions to-day.

In the Rocky mountain region more is known of Miocene floras. The Florissant beds of Colorado, studied by Prof. T. D. A. Cockerell, show beautiful leaf impressions, and recall the Oeningen beds of Switzerland. *Ailanthus, Anona, Liquidamber, Persea, Robinia, Sequoia,* also persimmon, fig, oak and pine are typical plants. The climate was probably similar to, but damper than, that of the present day.

Pliocene.—The Pliocene is not well represented. Its flora is essentially modern, and includes existing species, although a few, like *Trapa* (the water-chestnut), are now extinct in America.

CRETACEOUS AND TERTIARY PLANTS OF THE ARCTIC REGIONS

Our knowledge of Arctic plants comes, in the first instance, from the studies made by Heer between 1868 and 1883. He recognized two periods for flowering plants. The older is referred to the Cretaceous. The newer, by him called Miocene, is now generally referred to the Eocene. He described about 335 species from the Cretaceous, and 282 from the Tertiary, but the numbers are certainly far too large, as indicated by Prof. A. C. Seward's work in 1926. The plants come from various localities within the Arctic Circle ranging as far north as Grinnell Land, lat. 81, and Spitzbergen, lat. 79. That the plants are *in situ* is shown by the fact that some are rooted.

Cretaceous.—In the lower beds of the Greenland Cretaceous, from Kome, occurs one of the earliest known flowering plants, called by Heer a poplar. From later beds at Atane, besides ferns, some of which are referred to genera now tropical, come many conifers such as *Araucaria, Cupressus, Sciadopitys* and *Sequoia,* palms, *Artocarpus, Liriodendron, Magnolia, Sapindus, Sassafras, Rhus;* species referred to Proteaceae and Menispermaceae; also species of oak, poplar and fig. Still higher beds at Patoot contain *Acer, Acerates, Aralia, Zizyphus,* also species of fig, walnut, plane and buckthorn, among flowering plants; and *Dammara* among conifers.

Eocene.—The late Prof. Nathorst stated that the Eocene beds of Spitzbergen yield *Taxodium, Sequoia, Libocedrus,* grass, sedges, pines, willows and pond-weed. From Cape Lyell he recorded *Sequoia, Grewia, Magnolia,* water-plantain, maple, poplar, willow, alder, birch, hornbeam, hazel, beech, oak, elm, plane and lime.

From Greenland Heer recorded *Gingko, Libocedrus, Glyptostrobus, Taxodium, Sequoia, Pinus* among conifers; *Sassafras, Acerates, Nyssa, Vitis, Acer, Koelreuteria, Juglans, Rhus,* and many catkin-bearing trees among flowering plants. The climate was temperate.

Most of these genera reappeared in the Tertiary of Europe and America. They are related to plants now living in Asia and America. Some also live in Europe. The occurrence of these plants within the Arctic Circle has a most important bearing upon the interpretation of plant-history in the Northern Hemisphere.

TERTIARY PLANTS IN RELATION TO WORLD HISTORY

Summary.—The Tertiary floras of Europe, America and the Arctic, and the living floras of the Far East and North America, are all intimately related. What little is known of the Tertiary floras of Russia and Asia indicates that they, too, were related. It follows that Tertiary floras of an east Asian-American alliance lived on to form the source of much of the living floras of east Asia and America, but were killed in Eurasia. In those regions where they lived, there are no transcontinental mountain-chains forming barriers between the Pole and the Equator, whereas in

the regions where they died, there are. Further, the mountain-chains were being formed whilst the extermination was in progress, and the extermination was greatest after they were formed. Hence it may be inferred that the mountain-chains helped to kill. There is another set of facts which points to the same conclusion. In the early Tertiary, the European flora showed considerable alliance with Indian and African plants, indicating passage between these regions. Later, at the time when the barrier was in existence, the alliance died out. Again, therefore, the barrier would seem to have helped to kill. Alliances must indicate either linkages through some common source, or direct linkage. Also, if the allies are far removed, they must indicate migration. The interruption of the alliances by east-west barriers must indicate that the migration was north-south. Finally the presence of ever cooler and cooler forms must indicate that it was from north to south.

Explanation.—The phenomena involved are of world-wide significance, not localized. The best explanation is that originally suggested by Saporta. It meets all the facts, and is based on the assumption that whilst the temperature of, at least, the northern portion of the Northern Hemisphere underwent change, no change, or but very slight, took place in the position of the Poles. As the full measure of the relationship with plants of the Far East has become better known, the evidence supporting this explanation has become more full and definite. The explanation is that in Cretaceous and early Tertiary times the North Polar regions supported a warm type of vegetation, allied to living plants. In the Cretaceous these were of a sub-tropical or warm-temperate type; in the Eocene of a cooler type, at which time the flora of Britain and France was tropical. Slowly the climate cooled, and as it did so, plants migrated southward throughout Europe, Asia and North America, their places being taken by others of a cooler type. These new forms must have been evolved in the north since the linkage of floras continued throughout the Tertiary. The migrants must have suffered loss by the way and undergone evolutionary changes even in America and east Asia, for, although allied to one another, the living floras of these regions differ. Some elements were lost here, others there. In Europe and western Asia the whole were ultimately destroyed. With the ever increasing cold behind, and the impassable mountains in front, they perished, leaving scarcely a trace.

Space will not permit us to enter into any full discussion of the recurrence of Glacial and inter-Glacial periods and the influence they may have had on the flora. It is evident, however, that if climatic alterations, such as those just described, are part of the normal routine that has gone on through all geological periods, and are not merely confined to the latest, then such changes must evidently have had great influence on the evolution and geographical distribution both of species and of floras. Whether this was so is a question still to be decided, for in dealing with extinct floras it is difficult to decide, except in the most general way, to what climatic conditions they point. We seem to find indications of long-period climatic oscillations in Tertiary times, but none of the sudden invasion of an Arctic flora, like that which occurred during more recent times.

It might appear from the above that the Eurasian continent was gradually depleted of plants. But this was not so. The flora was greatly impoverished, and has remained so, in marked contrast to that of America, and especially to that of the Far East. But new plants came in to form the living flora of Eurasia. Where they came from is not certain. Some may have come from the north, but many, possibly most, appear to have come from the vast highlands of central Asia. Their history has yet to be discovered.

QUATERNARY PLANTS

The latest chapters in the history of our planet belong to the Quaternary period, and to these chapters plants contribute a very important share. We confine our attention to the Quaternary of Europe, because from it comes almost the whole of our information. The most important feature so far disclosed in the Quaternary of America is the presence of a few east Asian or European plants—*Xanthium, Pterocarya,* cinnamon and laurel, which died out later.

Compared with the Tertiary, the Quaternary period was short —a few hundred thousand years. The important facts regarding it are: (1) In north Europe a series of rapid and marked climatic changes took place. (2) Throughout the period man is known to have lived.

With the Quaternary ice age, the cooling of the northern regions, which had been going on since the Eocene, reached a climax. The ice age was not a period of unbroken Arctic cold. This is shown clearly by beds of temperate plants intercalated between others showing cold conditions. Such temperate, interglacial beds have been found throughout north Europe, including Britain. Most of the plants now live in these regions; a few are extinct; and others survive elsewhere. The British plants indicate a climate about as warm as, but drier than, that of the present day.

In beds of preceding and succeeding age colder types of plants occur. Dwarf arctic willow and the arctic birch flourished on the plains of Germany and in the south of England. The ground was gay with arctic and alpine flowers—*Primula farinosa, Saxifraga oppositifolia, Dryas octopetala, Polygonum viviparum,* the alpine poppy, flax, potentilla, geranium, scabious, campanula, gentian and the bearberry. *Ranunculus hyperboreus,* one of the most arctic of buttercups, grew in the Isle of Wight. It now lives no further south than the Dovrefjeld mountains, Lapland, Alaska and Labrador. These changes were going on whilst palaeolithic man lived in Europe.

Subsequently the climate ameliorated. The snow and ice retreated, although slight alternations of climate still occurred. Some of these have been traced by the statistical study of pollen in peat Using this study for the investigation of peat dredged from the floor of the Dogger Bank, 60 ft. beneath the sea, Dr. G. Erdtman, of Stockholm, discovered that it belonged to the "boreal" period, when the climate was cold but not arctic. The peat had previously been studied by the Reids who found evidence of a great fenland stretching from England to the Continent. The "boreal" period which saw this fenland in existence belongs to the age of early Neolithic man. In Neolithic deposits various cultivated plants are found: wheat, barley, millet, apples, pears, the opium poppy and flax.

As prehistory passes into history we glean interesting scraps of information. Tutankhamun was buried with a string of seeds from the magic mandrake around his neck; the Celts grew wheat, barley and beans at Glastonbury; and the Romans brought coriander, fig, grape and mulberry to Silchester, also many vegetables and wild fruits.

BIBLIOGRAPHY.—The literature dealing with Tertiary plants is usually technical and is mainly embodied in papers published in scientific periodicals. Text-books on the subject are few, and treat it from the point of view of the botanist, without giving any account of the composition of successive floras. The most useful text-books are: H. Potonie, *Lehrbuch der Palaobotanik* (revised by W. Gothan, 1921); K. A. Zittel, *Handbook of Palaeontology,* vol. ii., trans. by C. R. Eastmann (London, 1925). Full references to all palaeobotanical papers published before 1889 will be found in Lester Ward, "The Geographical Distribution of Fossil Plants," *8th Report U.S. Geological Survey* (Washington, D.C., 1889). References to all American literature up to 1919 will be found in F. H. Knowlton, "A Catalogue of the Cenozoic Plants of North America," *Bull. 696, U.S. Geol. Survey* (Washington, D.C., 1919). E. W. Berry, *Tree Ancestors* (Baltimore, 1923), is an interesting popular work. Two important and interesting early works are O. Heer, *The Primaeval World of Switzerland* (trans. and edit. by James Heywood, 2 vols., London, 1876), and G. de Saporta, *Le Monde des Plantes* (Paris, 1879). Recent large European publications which give very full references to more recent literature are C. and E. M. Reid, "The Pliocene Floras of the Dutch-Prussian Border," *Med. Rijksops. Delfstoffen,* No. 6 (The Hague, 1915); R. Kraüsel, "Nachtrage zur Tertiarflora Schlesiens," *Jahrb. Geol. Landersanst*, vol. xxxix.-xl. (Berlin, 1920–21); G. Depape "La Flore Pliocène de la vallée du Rhône," *Ann. des Sc. nat. bot*, vol. iv, 10th series (Paris, 1922); E. M. Reid and M. E. J. Chandler, *Catalogue of the Cainozoic Plants,* vol. i., British Museum, Nat. Hist. (1926). Literature on Quaternary plants is even more scattered and often appears in a supplementary form to other work The only text-books dealing with the subject are C. Reid, *The Origin of the British Flora* (London, 1899), which contains references to work prior to 1899, and C. Reid, *Submerged Forests* (Cambridge, 1913). J. R. Matthews, "The Distribution of Certain Portions of the

British Flora," part 1, *Ann. Bot.*, vol. xxxvii. (London, 1923), contains references to several papers dealing with British deposits. G. Erdtman, "Literature on Pollen-Statistics Published before 1927," *Geolog. Forens.* (Stockholm, March-April, 1927), contains full references to all literature on pollen work. (E. M. R.; M. E. J. C.)

PALAEOGNATHAE, the term used in ornithology (*q.v.*) to denote the more primitive modern birds, replacing the older term Ratitae (*q.v.*).

PALAEOGRAPHY, the name given to the science of ancient handwriting acquired from a study of surviving examples. The word is sometimes erroneously used where epigraphy would be better (for inscriptions, *q.v.*, on stone or metal). It is difficult, indeed, to define the boundary between the two sciences; many of the ancient inscriptions of the Far East, Cambodia, India, Ceylon, etc., may quite legitimately be dealt with as part of the study of palaeography, although they are usually treated by epigraphists as purely confined to their realm of activity. The different implements used from the beginning in the making of marks or outline characters, whereby man made a permanent record of his thoughts and experiences, have had their influence on the classification of writings as adopted by later scholars.

For a discussion of the palaeography of Far Eastern peoples the article INSCRIPTIONS should be consulted. In the present article only Greek and Latin palaeography will be discussed. In the articles EGYPT and HIEROGLYPHICS will be found details of the Egyptian records. (X.)

GREEK

A history of Greek handwriting must be incomplete owing to the fragmentary nature of the evidence. If we rule out the inscriptions on stone or metal, which belong to the science of epigraphy, we are practically dependent for the period preceding the 4th or 5th century of the Christian era on the papyri from Egypt (*see* PAPYROLOGY) the earliest of which take back our knowledge only to the end of the 4th century B.C. This limitation is less serious than it might appear, since the few mss. not of Egyptian origin which have survived from this period, like the parchments from Avroman (E. H. Minns, *Journ. of Hell. Stud.*, xxxv., 22 *seq.*) or Dura (*New Pal. Soc.*, ii., 156), the Herculaneum papyri, and a few documents found in Egypt but written elsewhere, reveal a surprising uniformity of style in the various portions of the Greek world; but some differences can be discerned, and it is probable that, had we more material, distinct local styles could be traced.

Further, at any given period several types of hand may exist together. There was a marked difference between the hand used for literary works (generally called "uncials" but, in the papyrus period, better styled "book-hand") and that of documents ("cursive") and within each of these classes several distinct styles were employed side by side; and the various types are not equally well represented in the surviving papyri.

The development of any hand is largely influenced by the materials used. To this general rule the Greek script is no exception. Whatever may have been the period at which the use of papyrus or leather as a writing material began in Greece (and papyrus was employed in the 5th century B.C.), it is highly probable that for some time after the introduction of the alphabet the characters were incised with a sharp tool on stone or metal far oftener than they were written with a pen. In cutting a hard surface it is easier to form angles than curves; in writing the reverse is the case; hence the development of writing was from the angular letters ("capitals") inherited from the epigraphic style to rounded ones ("uncials"). But only certain letters were affected by this development, in particular E (uncial ϵ), Σ (c), Ω (ω), and to a less extent A (α).

The Ptolemaic Period.—The earliest Greek papyrus yet discovered is probably that containing the *Persae* of Timotheus, which dates from the second half of the 4th century B.C. and its script has a curiously archaic appearance. E, Σ, and Ω have the capital form, and apart from these test letters the general effect is one of stiffness and angularity. More striking is the hand of the earliest dated papyrus, a contract of 311 B.C. Written with more ease and elegance, it shows little trace of any development towards a truly cursive style; the letters are not linked, and though the uncial c is used throughout, E and Ω have the capital forms. A similar impression is made by the few other papyri, chiefly literary, dating from about 300 B.C.; E may be slightly rounded, Ω approach the uncial form, and the angular Σ occurs as a letter only in the Timotheus papyrus, though it survived longer as a numeral (=200), but the hands hardly suggest that for at least a century and a half the art of writing on papyrus had been well established. Yet before the middle of the 3rd century B.C. we find both a practised book-hand and a developed and often remarkably handsome cursive.

These facts may be due to accident, the few early papyri happening to represent an archaic style which had survived along with a more advanced one; but it is likely that there was a rapid development at this period, due partly to the opening of Egypt, with its supplies of papyri, and still more to the establishment of the great Alexandrian library, which systematically copied literary and scientific works, and to the multifarious activities of Hellenistic bureaucracy. Henceforward the two types of script were sufficiently distinct (though each influenced the other) to require separate treatment. Some literary papyri, like the roll containing Aristotle's *Constitution of Athens*, were written in cursive hands, and, conversely, the book-hand was occasionally used for documents. Since the scribes did not date literary rolls such papyri are useful in tracing the development of the book-hand.

The documents of the mid 3rd century B.C. show a great variety of cursive hands. We have none from the chancelleries of the Hellenistic monarchs, but some letters, notably those of Apollonius, the finance minister of Ptolemy II., to his agent, Zeno, and those of the Palestinian sheikh, Toubias, are in a type of script which cannot be very unlike the Chancery hand of the time, and show the Ptolemaic cursive at its best. These hands have a noble spaciousness and strength, and though the individual letters are by no means uniform in size there is a real unity of style, the general impression being one of breadth and uprightness. H, with the cross-stroke high, Π, M, with the middle strokes reduced to a very shallow curve, sometimes approaching a horizontal line, Υ, and T, with its cross-bar extending much further to the left than to the right of the up-stroke, Γ and N, whose last stroke is prolonged upwards above the line, often curving backwards, are all broad; ϵ, c, θ, and β, which sometimes takes the form of two almost perpendicular strokes joined only at the top, are usually small; ω is rather flat, its second loop reduced to a practically straight line. Partly by the broad flat tops of the larger letters, partly by the insertion of a stroke connecting those (like H, Υ) which are not naturally adapted to linking, the scribes produced the effect of a horizontal line along the top of the writing, from which the letters seem to hang. This feature is indeed a general characteristic of the more formal Ptolemaic script, but it is specially marked in the 3rd century B.C.

Besides these hands of Chancery type, there are numerous less elaborate examples of cursive, varying according to the writer's skill and degree of education, and many of them strikingly easy and handsome. In some cursiveness is carried very far, the linking of letters reaching the point of illegibility, and the characters sloping to the right. A is reduced to a mere acute angle (∠), T has the cross-stroke only on the left, ω becomes an almost straight line, H acquires a shape somewhat like h, and the last stroke of N is extended far upwards and at times flattened out till it is little more than a diagonal stroke to the right. The attempt to secure a horizontal line along the top is here abandoned. This style was not due to inexpertness, but to the desire for speed, being used specially in accounts and drafts, and was generally the work of practised writers. How well established the cursive hand had now become is shown by some wax tablets of this period in University college, London (*Ancient Egypt*, 1927, part 3), the writing on which, despite the difference of material, closely resembles the hands of papyri.

Documents of the late 3rd and early 2nd centuries B.C. show,

perhaps partly by the accident of survival (we have nothing analogous to the Apollonius letters), a loss of breadth and spaciousness. In the more formal types the letters stand rather stiffly upright, often without the linking strokes, and are more uniform in size; in the more cursive they are apt to be packed closely together. These features are more marked in the hands of the 2nd century. The less cursive often show an approximation to the book-hand, the letters growing rounder and less angular than in the 3rd century, in the more cursive linking was carried further, both by the insertion of coupling strokes and by the writing of several letters continuously without raising the pen, so that before the end of the century an almost current hand was evolved. A characteristic letter, which survived into the early Roman period, is T, with its cross-stroke made in two portions (Ƭ). In the 1st century the hand tended, so far as can be inferred from the surviving examples, to disintegrate, we can recognize the signs which portend a change of style, irregularity, want of direction, and the loss of the feeling for style. A fortunate accident has preserved two Greek parchments written in Parthia, one dated 88 B.C., in a practically unligatured hand, the other, 22/21 B.C., in a very cursive script of Ptolemaic type, and though each has un-Egyptian features the general character indicates a uniformity of style in the Hellenistic world.

The development of the Ptolemaic book-hand is difficult to trace, as there are few examples, mostly not datable on external grounds. Only for the 3rd century B.C. have we a secure basis. The hands of that period have an angular appearance, there is little uniformity in the size of individual letters, and though sometimes, notably in the Petrie papyrus containing the *Phaedo* of Plato, a style of considerable delicacy is attained, the book-hand in general shows less mastery than the contemporary cursive. In the 2nd century the letters grew rounder and more uniform in size, but in the 1st century there is perceptible, here as in the cursive hand, a certain disintegration. Probably at no time did the Ptolemaic book-hand acquire such unity of stylistic effect as the cursive.

The Roman Period.—Papyri of the Roman period are far more numerous and show greater variety. The cursive of the 1st century has a rather broken appearance, part of one character being often made separately from the rest and linked to the next letter. A form characteristic of the 1st and 2nd centuries and surviving after that only as a fraction sign ($=\frac{1}{8}$) is η in the shape J. By the end of the 1st century there had been developed several excellent types of cursive, which, though differing considerably both in the forms of individual letters and in general appearance, bear a family likeness to one another. Qualities which are specially noticeable are roundness in the shape of letters, continuity of formation, the pen being carried on from character to character, and regularity, the letters not differing strikingly in size and projecting strokes above or below the line being avoided. Sometimes, especially in tax-receipts and in stereotyped formulae, cursiveness is carried to an extreme. In a letter of the prefect, dated in 209, we have a fine example of the Chancery hand, with tall and laterally compressed letters, *o* very narrow and α and ω often written high in the line. This style, from at least the latter part of the 2nd century, exercised considerable influence on the local hands, many of which show the same characteristics less pronounced; and its effects may be traced into the early part of the 4th century. Hands of the 3rd century uninfluenced by it show a falling off from the perfection of the 2nd century; stylistic uncertainty and a growing coarseness of execution mark a period of decline and transition.

Several different types of book-hand were used in the Roman period. Particularly handsome is a round, upright hand seen, *e.g.*, in a British Museum papyrus containing *Odyssey* III. The cross-stroke of ϵ is high, M deeply curved and A has the form α. Uniformity of size is well attained, and few strokes project, and these but slightly, above or below the line. Another type, well called by Schubart the "severe" style, has a more angular appearance and not infrequently slopes to the right; though handsome, it has not the sumptuous appearance of the former. There are various classes of a less pretentious style, in which convenience rather than beauty was the first consideration and no pains were taken to avoid irregularities in the shape and alignment of the letters. Lastly may be mentioned a hand which is of great interest as being the ancestor of the type called (from its later occurrence in vellum codices of the Bible) the biblical hand. This, which can be traced back to at least the late 2nd century, has a square, rather heavy appearance, the letters, of uniform size, stand upright, and thick and thin strokes are well distinguished. In the 3rd century the book-hand, like the cursive, appears to have deteriorated in regularity and stylistic accomplishment.

In the charred rolls found at Herculaneum and dating from about the beginning of our era we have specimens of Greek literary hands from outside Egypt, and a comparison with the Egyptian papyri reveals great similarity in style and shows that conclusions drawn from the hands of Egypt may, with caution, be applied to the development of writing in the Greek world generally.

The Byzantine Period.—The cursive hand of the 4th century shows some uncertainty of character. Side by side with the style founded on the Chancery hand, regular in formation and with tall and narrow letters, which characterized the period of Diocletian, and lasted well into the century, we find many other types mostly marked by a certain looseness and irregularity. A general progress towards a florid and sprawling hand is easily recognizable, but a consistent and deliberate style was hardly evolved before the 5th century, from which unfortunately few dated documents have survived. Byzantine cursive tends to an exuberant hand, in which the long strokes are excessively extended and individual letters often much enlarged. But not a few hands of the 5th and 6th centuries are truly handsome and show considerable technical accomplishment. Both an upright and a sloping type occur and there are many less ornamental hands, but there gradually emerged towards the 7th century two general types, one (specially used in letters and contracts) a current hand, sloping to the right, with long strokes in such characters as τ, ρ, ξ, η (which has the h shape), ι, and κ, and with much linking of letters, and another (frequent in accounts), which shows, at least in essence, most of the forms of the later minuscule. (*See* below.) This is often upright, though a slope to the right is quite common, and sometimes, especially in one or two documents of the early Arab period, it has an almost calligraphic effect.

In the Byzantine period the book-hand, which in earlier times had more than once approximated to the contemporary cursive, diverged widely from it.

VELLUM AND PAPER MSS.

The change from papyrus to vellum involved no such modification in the forms of letters as followed that from metal to papyrus. The justification for considering the two materials separately is that after the general adoption of vellum the Egyptian evidence is first supplemented and later superseded by that of mss. from elsewhere, and that during this period the hand most used was one not previously employed for literary purposes.

The Uncial Hand.—The prevailing type of book-hand during what in papyrology is called the Byzantine period, *i.e.*, roughly from A.D. 300 to 650, is known as the biblical hand. It went back to at least the end of the 2nd century and had had originally no special connection with Christian literature. In mss., whether vellum or paper, of the 4th century found in Egypt we meet other forms of script, particularly a sloping, rather inelegant hand derived from the literary hand of the 3rd century, which persisted to at least the 5th century, but the three great early codices of the Bible are all written in uncials of the biblical type. In the Vaticanus, placed in the 4th century, the characteristics of the hand are least strongly marked, the letters have the forms characteristic of the type but without the heavy appearance of later mss., and the

general impression is one of greater roundness. In the Sinaiticus, which is not much later, the letters are larger and more heavily made; and in the Alexandrinus (5th century?) a later development is seen, with emphatic distinction of thick and thin strokes. By the 6th century, alike in vellum and in papyrus mss., the heaviness had become very marked, though the hand still retained, in its best examples, a handsome appearance; but after this it steadily deteriorated, becoming ever more mechanical and artificial. The thick strokes grew heavier; the cross strokes of Τ and Θ and the base of Δ were furnished with drooping spurs. The hand, which is often singularly ugly, passed through various modifications, now sloping, now upright, though it is not certain that these variations were really successive rather than concurrent. A different type of uncials, derived from the Chancery hand and seen in two papyrus examples of the Festal letters despatched annually by the Patriarchs of Alexandria, was occasionally used, the best known example being the Codex Marchalianus (6th or 7th century?). A combination of this hand with the other type is also known.

The Minuscule Hand.—The uncial hand lingered on, mainly for liturgical mss., where a large and easily legible script was serviceable, as late as the 12th century, but in ordinary use it had long been superseded by a new type of hand, the minuscule, which originated in the 8th century, as an adaptation to literary purposes of the second of the types of Byzantine cursive mentioned above. A first attempt at a calligraphic use of this hand, seen in one or two mss. of the 8th or early 9th century (*e.g.*, *Specimina Cod. Graec. Vatican.* No. 5), in which it slopes to the right and has a narrow, angular appearance, did not find favour, but by the end of the 9th century a more ornamental type, from which modern Greek script is descended, was already established. It has been suggested (T. W. Allen, *Journ. Hell. Stud.* xl., 1–12) that it was evolved in the monastery of the Studium at Constantinople. In its earliest examples it is upright and exact but lacks flexibility; accents are small, breathings square in formation, and in general only such ligatures are used as involve no change in the shape of letters. The single forms have a general resemblance (with considerable differences in detail) both to the minuscule cursive of late papyri, and to those used in modern Greek type; uncial forms were avoided.

In the course of the 10th century the hand, without losing its beauty and exactness, gained in freedom. Its finest period was from the 9th to the 12th century, after which it rapidly declined. The development was marked by a tendency (1) to the intrusion, in growing quantity, of uncial forms, which good scribes could fit into the line without disturbing the unity of style but which, in less expert hands, had a disintegrating effect; (2) to the disproportionate enlargement of single letters, especially at the beginnings and ends of lines; (3) to ligatures, often very fantastic, which quite changed the forms of letters; (4) to the enlargement of accents, breathings at the same time acquiring the modern rounded form. But from the first there were several styles, varying from the formal, regular hands characteristic of service books to the informal style, marked by numerous abbreviations, used in mss. intended only for a scholar's private use. The more formal hands were exceedingly conservative, and there are few classes of script more difficult to date than the Greek minuscule of this class. In the 10th, 11th and 12th centuries a sloping hand, less dignified than the upright, formal type, but often very handsome, was specially used for mss. of the classics.

Hands of the 11th century are marked in general (though there are exceptions) by a certain grace and delicacy, exact but easy; those of the 12th by a broad, bold sweep and an increasing freedom, which readily admits uncial forms, ligatures and enlarged letters but has not lost the sense of style and decorative effect. In the 13th and still more the 14th centuries there was a steady decline; the less formal hands lost their beauty and exactness, becoming ever more disorderly and chaotic in their effect, while the formal style imitated the precision of an earlier period without attaining its freedom and naturalness, and often appears singularly lifeless. In the 15th century, especially in the West, where Greek scribes were in request to produce mss. of the classical authors, there was a revival, and several mss. of this period, though markedly inferior to those of the 11th and 12th centuries, are by no means without beauty.

ACCENTS, PUNCTUATION, DIVISION OF WORDS

In the book-hand of early papyri neither accents nor breathings were employed. Their use was established by the beginning of the Roman period, but was sporadic in papyri, where they were used as an aid to understanding, and therefore more frequently in poetry than in prose, and in lyrical oftener than in other verse. In the cursive of papyri they are practically unknown, as are marks of punctuation. Punctuation was effected in early papyri, literary and documentary, by spaces, reinforced in the book-hand by the paragraphus, a horizontal stroke under the beginning of the line. The coronis, a more elaborate form of this, marked the beginning of lyrics or the principal sections of a longer work. Punctuation marks, the comma, the high, low and middle points, were established in the book-hand by the Roman period; in early Ptolemaic papyri a double point (:) is found.

In vellum and paper mss. punctuation marks and accents were regularly used from at least the 8th century, though with some differences from modern practice. At no period down to the invention of printing did Greek scribes consistently separate words. The book-hand of papyri aimed at an unbroken succession of letters, except for distinction of sections; in cursive hands, especially where abbreviations were numerous, some tendency to separate words may be recognized, but in reality it was phrases or groups of letters rather than words which were divided. In the later minuscule word-division is much commoner but never became systematic, accents and breathings serving of themselves to indicate the proper division.

BIBLIOGRAPHY.—General: V. Gardthausen, *Griechische Palaeographie* (2nd ed., Leipzig, 1911–13), a comprehensive work; should be supplemented by the 1st ed. (Leipzig, 1879), as some useful features of that work are omitted, and by the monographs mentioned in the introduction; ample bibliographies; E. M. Thompson, *An Introduction to Greek and Latin Palaeography* (Oxford, 1912), the handiest general account of the whole subject, with numerous facsimiles and good bibliography; W. Schubart, *Griechische Palaeographie* (Munich, 1925), being vol. i., part 4, 1st half of the new ed. of Müller's *Handbuch der Altertumswissenschaft* (the best and most up-to-date sketch for papyri; inadequate for the hands of vellum and paper mss.; many facsimiles and a bibliography); Palaeographical Society and New Palaeographical Society, *Facsimiles,* two series each (1873–83, 1884–94, 1903–12–13, etc.), an invaluable series of facsimiles with transcripts and palaeographical commentary; W. Schubart, *Das Buch bei den Griechen und Romern* (2nd ed, 1921). Papyri: F. G. Kenyon, *The Palaeography of Greek Papyri* (Oxford, 1899) (out of date but still useful; good facsimiles); W. Schubart, *Papyri Graecae Berolinenses* (Bonn, 1911), No. 2 of the series *Tabulae in Usum Scholarum* (a cheap collection of good facsimiles); atlases to vols. i.–iii. of *Greek Papyri in the British Museum* (1893–1907). Vellum and paper mss.: H. Omont, *Fac-similés des plus anciens manuscrits grecs . . . de la Bibliothèque Nationale* (1892), chiefly undated mss., uncial and minuscule, one papyrus; and *Fac-similés des manuscrits grecs datés de la Bibliothèque Nationale du IX.e au XIV.e siècle* (1891), most useful for dating purposes; P. F. de' Cavalieri and J. Lietzmann, *Specimina codicum Graecorum Vaticanorum* (Bonn, 1910), a cheap and handy series; G. Vitelli and C. Paoli, *Collezione fiorentina di facsimili paleografici* (Florence, 1897); G. Cereteli and S. Sobolevski, *Exempla codicum Graecorum litteris minusculis scriptorum annorumque notis instructorum,* Moscow, also Leipzig (1911–13), and *Exempla codicum graecorum litteris uncialibus scriptorum* (1913), two very useful series; T. W. Allen, *Notes on Abbreviations in Greek Manuscripts* (1889); A. Papadopoulos-Kerameus, ΙΕΡΟΣΟΛΥΜΙΤΙΚΗ ΒΙΒΛΙΟΘΗΚΗ (1891–99), has useful facsimiles. LATIN

Attention should be drawn at the outset to certain fundamental definitions and principles of the science. The original characters of an alphabet are modified by the material and the implements used. When stone and chisel are discarded for papyrus and reed-pen, the hand encounters less resistance and moves more rapidly. This leads to changes in the size and position of the letters, and then to the joining of letters, and, consequently, to altered shapes. We are thus confronted at an early date with quite distinct types.

The majuscule style of writing, based on two parallel lines, ADLP. is opposed to the minuscule, based on a system of four lines, with letters of unequal height, adlp. Another classification, according to the care taken in forming the letters, distinguishes between the set book-hand and the cursive script. The difference in this case is determined by the subject matter of the text; the writing used for books (*scriptura libraria*) is in all periods quite distinct from that used for letters and documents (*epistolaris, diplomatica*). While the set book-hand, in majuscule or minuscule, shows a tendency to stabilize the forms of letters, the cursive, often carelessly written, is continually changing in the course of years and according to the preferences of the writers.

This being granted, a summary survey of the morphological history of the Latin alphabet shows the zenith of its modifications at once, for its history is divided into two very unequal periods, the first dominated by majuscule and the second by minuscule writing.

I. MAJUSCULE WRITING

Capital Writing.—The Latin alphabet first appears in the epigraphic type of majuscule writing, known as capitals. These characters form the main stem from which developed all the branches of Latin writing. On the oldest monuments (the *inscriptiones bello Hannibalico antiquiores* of the *Corpus Inscriptionum Latinarum*), it is far from showing the orderly regularity of the later period. Side by side with upright and square characters are angular and sloping forms, sometimes very distorted, which seem to indicate the existence of an early cursive writing from which they would have been borrowed. Certain literary texts clearly allude to such a hand (Van Hoesen, *Roman Cursive Writing*, pp. 1–2). Later, the characters of the cursive type were progressively eliminated from formal inscriptions, and capital writing reached its perfection in the Augustan age.

Epigraphists divide the numerous inscriptions of this period into two quite distinct classes: *tituli*, or formal inscriptions engraved on stone in elegant and regular capitals, and *acta*, or legal texts, documents, etc., generally engraved on bronze in cramped and careless capitals. Palaeography inherits both these types. Reproduced by scribes on papyrus or parchment, the elegant characters of the inscriptions become the square capitals of the manuscripts (fig. 1), and the *actuaria*, as the writing of the *acta* is called, becomes the rustic capital (fig. 2).

Of the many books written in square capitals, the *éditions de luxe* of ancient times, only a few fragments have survived, the most famous being pages from manuscripts of Virgil (Chatelain, *Pal. des classiques latins*, pl. LXI.–II., LXXV.; *Oxyrhynchus Papyri*, viii., 1,098). The finest examples of rustic capitals, the use of which is attested by papyri of the first century (Zangemeister and Wattenbach, *Exempla*, pl. I.–II.), are to be found in manuscripts of Virgil (Ehrle, *Fragm. Virgiliana*, 1899; *Pal. Soc.*, pl. 113–117; *Archivio paleogr. ital.*, i., 98) and Terence (*Pal. Soc.*, pl. 135). Neither of these forms of capital writing offers any difficulty in reading, except that no space is left between the words. Their dates are still uncertain, in spite of attempts to determine them by minute observation (Dziatzko, *Untersuchungen;* E. A. Lowe in the *Classical Quarterly*, vol. xix., p. 197).

The rustic capitals, more practical than the square forms, soon came into general use. This was the standard form of writing, so far as books are concerned, until the 5th century, when it was replaced by a new type, the uncial, which will be discussed below.

Early Cursive Writing.—While the set book-hand, in square or rustic capitals, was used for the copying of books, the writing of every-day life, letters and documents of all kinds, was in a cursive form, the oldest examples of which are provided by the graffiti on walls at Pompeii (*C.I.L.*, iv.), a series of waxen tablets, also discovered at Pompeii (*C.I.L.*, iv., supplement), a similar series found at Verespatak in Transylvania (*C. I. L.*, iii.) and a number of papyri (Wessely, *Schrifttafeln* and *Studien zur Pal.*, xiv.; *Oxyrhynchus Papyri, passim;* Federici, *Esempi di corsiva antica;* etc.). (*See* figs. 3, 4.) From a number of documents which exhibit transitional forms it appears that this cursive was originally simplified capital writing (Steffens, *Lat. Pal.*, 2nd ed., pl. 3; Wessely, *Studien*, xiv., pl. viii., etc.). The evolution was so rapid, however, that at quite an early date the *scriptura epistolaris* of the Roman world can no longer be described as capitals. By the first century, this kind of writing began to develop the principal characteristics of two new types: the uncial and the minuscule cursive. With the coming into use of writing surfaces which were smooth, or offered little resistance, the unhampered haste of the writer altered the shape, size and position of the letters. In the earliest specimens of writing on wax, plaster or papyrus, there appears a tendency to represent several straight strokes by a single curve. The cursive writing thus foreshadows the specifically uncial forms. The same specimens show great inequality in the height of the letters; the main strokes are prolonged upwards (ɔ = *b*; ƌ = *d*) or downwards (ᑫ = *q*; ↽ = *z*). In this direction, the cursive tends to become a minuscule hand.

Uncial Writing.—Although the characteristic forms of the uncial type appear to have their origin in the early cursive (Thompson, *Latin Palaeography* in Sandy's *Companion*, 2nd ed., p. 771; Van Hoesen, *The Parentage and Birthdate of the Latin Uncial* in *Transactions and Proceedings* of the American Philological Association, xlii.), the two hands are nevertheless quite distinct. The uncial is a *libraria*, closely related to the capital writing, from which it differs only in the rounding off of the angles of certain letters, principally ɑ ∂ ϵ ɱ. It represents a compromise between the beauty and legibility of the capitals and the rapidity of the cursive, and is clearly an artificial product. It was certainly in existence by the latter part of the 4th century, for a number of manuscripts of that date are written in perfect uncial hands (*Exempla*, pl. 20 fig. 5). It soon supplanted the capitals and appears in numerous manuscripts which have survived from the 5th, 6th and 7th centuries, when it was at its height. (A list is given in Traube, *Vorlesungen*, i., 171–261, and numerous reproductions in Zangemeister and Wattenbach's *Exempla*, and in Chatelain, *Uncialis scriptura*.) By this time it had become an imitative hand, in which there was generally no room for spontaneous development. It remained noticeably uniform over a long period. It is difficult therefore to date the manuscripts by palaeographical criteria alone. The most that can be done is to classify them by centuries, on the strength of tenuous data (Chatelain, *Unc. script., explanatio tabularum*). The earliest uncial writing is easily distinguished by its simple and monumental character from the later hands, which become progressively stiff and affected.

II. MINUSCULE CURSIVE WRITING

Early Minuscule Cursive.—"When writing has to be done frequently and rapidly," says the *Nouveau Traité de Diplomatique* (ii., 491), "majuscule writing is bound to turn imperceptibly into a connected or cursive minuscule." It would be easy to illustrate this generalisation by examples taken from ancient cursive writing, in which here and there from the 1st century onwards are found symptoms of transformation in the form of certain letters, the shape and proportions of which correspond more closely to the definition of minuscule writing than to that of majuscule. Rare and irregular at first, they gradually become more numerous and more constant and by degrees supplant the majuscule forms, so that in the history of the Roman cursive there is no precise boundary between the majuscule and minuscule periods.

The oldest example of minuscule cursive writing that has been discovered is a letter on papyrus, found in Egypt, dating from the fourth century (*Archiv für Urkundenforschung*, iii., pl. i.; fig. 7). This marks an important date in the history of Latin writing, for with only one known exception, not yet adequately explained—two fragments of imperial rescripts of the 5th century (Mommsen, *Fragmente zweier Kaiserrescripte* in the *Jahrbuch des gemeinen deutschen Rechts*, vi., 398; Preisigke in *Schriften der wissensch. Gesellsch. in Strassburg*, xxx.; *Pal. Soc.*, pl. 30)—the minuscule cursive was thenceforth the only *scriptura epistolaris* of the Roman world.

The ensuing succession of documents (*e.g.*, a certificate of A.D. 400 in Wessely, *Studien*, xiv., pl. xiii.; a letter of A.D. 444 in Wessely, *Schrifttafeln*, pl. xii., No. 19) show a continuous

improvement in this form of writing, characterised by the boldness of the strokes and by the elimination of the last lingering majuscule forms. The Ravenna deeds of the 5th and 6th centuries (Marini, *I papiri diplomatici;* Champollion-Figeac, *Chartes et Mss. sur papyrus;* E. A. Bond, *Facsimiles of Ancient Charters; Archivio paleogr. italiano,* i., pl. 1–5) exhibit this hand at its perfection (fig. 8).

At this period the minuscule cursive made its appearance as a book-hand, first as marginal notes, and later for the complete books themselves. The only difference between the book-hand and that used for documents is that the principal strokes are shorter and the characters thicker. This form of the hand is usually called semi-cursive.

The National Hands.—The fall of the Empire and the establishment of the barbarians within its former boundaries did not interrupt the use of the Roman minuscule cursive hand, which was adopted by the newcomers. But for gaps of over a century in the chronological series of documents which have been preserved, it would be possible to follow the evolution of the Roman cursive into the so-called national hands, forms of minuscule writing which flourished after the barbarian invasions in Italy, France, Spain, England and Ireland, and which are still known as Lombardic, Merovingian, Visigothic, Anglo-Saxon and Irish. These names came into use at a time when the various national hands were believed to have been invented by the peoples who used them, but their connotation is merely geographical.

Nevertheless, in spite of a close resemblance which betrays their common origin, these hands are specifically different, perhaps because the Roman cursive was developed by each nation in accordance with its artistic tradition. (*Cf.* Schiaparelli, *Note paleografiche* in *Archivio stor. italiano,* lxxiv. 55.)

Lombardic Writing.—In Italy, after the close of the Roman and Byzantine periods, the writing is known as Lombardic, a generic term which comprises several local varieties. These may be classified under four principal types: two for the *scriptura epistolaris,* the old Italian cursive and the papal chancery hand, or *littera romana,* and two for the *libraria,* the old Italian book-hand and Lombardic in the narrow sense, sometimes known as *Beneventana* on account of the fact that it flourished in the principality of Benevento.

The oldest preserved documents written in the old Italian cursive show all the essential characteristics of the Roman cursive of the 6th century (Bonelli, *Cod. pal. lombardo; Arch. pal. ital.,* i., iii., vii.). In northern Italy, this hand began in the 9th century to be influenced by a minuscule book-hand which developed, as will be seen later, in the time of Charlemagne; under this influence it gradually disappeared, and ceased to exist in the course of the 12th century. In southern Italy, it persisted far on into the later middle ages (Russi, *Paleogr. . . . de' docum. della prov. Napolitana*).

The papal chancery hand, a variety of Lombardic peculiar to the vicinity of Rome and principally used in papal documents, is distinguished by the shape of the letters, *a, e, q, t* (fig 9). It is formal in appearance at first, but is gradually simplified, under the influence of the Carolingian minuscule, which finally prevailed in the bulls of Honorius II. (1124–1130). The notaries public in Rome continued to use the papal chancery hand until the beginning of the 13th century.

The old Italian book-hand is simply a semi-cursive of the type already described as in use in the 6th century. The principal examples are derived from *scriptoria* in northern Italy, where it was displaced by the Carolingian minuscule during the 9th century.

In southern Italy, this hand persisted, developing into a calligraphic form of writing, and in the 10th century took on a very artistic angular appearance (Lowe, *Beneventan Script;* facsimiles in Piscicelli-Taeggi, *Paleogr. artist. di Monte Cassino*). The *Exultet* rolls provide the finest examples (fig. 10). In the 9th century, it was introduced in Dalmatia by the Benedictine monks and developed there, as in Apulia, on the basis of the archetype, culminating in a rounded *Beneventana* known as the Bari type (Novak, *Scriptura Beneventana,* Zagreb, 1920).

Merovingian—The offshoot of the Roman cursive which developed in Gaul under the first dynasty of kings is called Merovingian writing. It is represented by thirty-eight royal diplomas (Lauer and Samaran, *Les diplômes originaux des Mérovingiens*), a number of private charters (Tardif, *Facsim. de chartes et diplômes*) and the authenticating documents of relics (Prou, *Recueil de facsim.,* 1904, pl. v.).

Though less than a century intervenes between the Ravenna cursive and the oldest extant Merovingian document (A.D. 625), there is a great difference in appearance between the two writings. The facile flow of the former is replaced by a cramped style, in which the natural slope to the right gives way to an upright hand, and the letters, instead of being fully outlined, are compressed to such an extent that they modify each other's shape (fig. 11). Copyists of books used a cursive similar to that found in documents, except that the strokes are thicker, the forms more regular, and the heads and tails shorter (*Album paléogr. de la Soc. de l' Ec. des Chartes,* pl. 12).

The Merovingian cursive as used in books underwent simplification in some localities, undoubtedly through the influence of the minuscule book-hand of the period. The two principal centres of this reform were Luxeuil and Corbie (Traube, *Perrona Scottorum* in *Sitzungsberichte* of the Munich Academy, 1900; Liebart, *Corbie Scriptorium* in W. M. Lindsay's *Palaeogr. Lat.,* i.).

With the appearance, early in the 8th century, of the Carolingian minuscule, the Merovingian hand ceased to be used for books. In the Carolingian chancery, where it persisted longest, it soon discarded its characteristic forms and intricate combinations of letters under the influence of the new hand. Only a few archaic types with long slender heads and tails, vaguely reminiscent of the old script, survived in diplomatic writing until the 11th century.

Visigothic Writing.—In Spain, after the Visigothic conquest, the Roman cursive gradually developed special characteristics. Some documents attributed to the 7th century display a transitional hand with straggling and rather uncouth forms (Ewald and Loewe, *Exempla scripturae visigothicae,* pl. 3). The distinctive features of Visigothic writing, the most noticeable of which is certainly the q-shaped g, did not appear until later, in the book-hand. The book-hand became set at an early date. In the 8th century it appears as a sort of semi-cursive; the earliest example of certain date is ms. lxxxix. in the Capitular Library in Verona (Clark, *Collectanea hispanica,* 63, 129–130; Schiaparelli in *Arch. stor. ital.* lxxxii., 106). From the 9th century the calligraphic forms become broader and more rounded until the 11th century, when they become slender and angular (numerous reproductions in Ewald and Loewe, *Exempla;* Burnam, *Paleogr. iberica;* Clark, *Collectanea;* Garcia Villada, *Paleogr. espanola*).

The Visigothic minuscule appears in a cursive form in documents about the middle of the 9th century, and in the course of time grows more intricate and consequently less legible (Munoz, *Paleogr. visigoda;* Garcia Villada, *op. cit.*). It soon came into competition with the Carolingian minuscule, which supplanted it as a result of the presence in Spain of French elements such as Cluniac monks and warriors engaged in the campaign against the Moors (Hessel, *Ausbreitung der karol Minuskel* in *Archiv für Urkundenforschung,* vii., viii.).

The Irish and Anglo-Saxon hands, which were not directly derived from the Roman minuscule cursive, will be discussed later

III. SET MINUSCULE WRITING

One after another, the national minuscule cursive hands were superseded by a set minuscule hand which has already been mentioned. Its origins may now be traced from the beginning.

Half-uncial Writing.—The early cursive was the medium in which the minuscule forms were gradually evolved from the corresponding majuscule forms. Minuscule writing was thus cursive in its inception. As the minuscule letters made their appearance in the cursive writing of documents, they were adopted and given calligraphic form by the copyists of literary texts, so that the set minuscule alphabet was constituted gradually, letter by letter, following the development of the minuscule cursive. Just as some documents written in the early cursive show a mixture of

majuscule and minuscule forms, so certain literary papyri of the 3rd century (*Oxyrhynchus Papyri,* iv., pl. vi., No. 668; xi., pl. vi., No. 1,379), and inscriptions on stone of the 4th century (*Pal. Soc.,* pl. 127–8; *Arch. pal. ital.,* v., pl. 6) yield examples of a mixed set hand, with minuscule forms side by side with capital and uncial letters. The number of minuscule forms increases steadily in texts written in the mixed hand, and especially in marginal notes, until by the end of the 5th century the majuscule forms have almost entirely disappeared in some mss.

This quasi-minuscule writing, known as the Half-uncial (fig. 12; many examples in Chatelain, *Semiuncial Script.*) is thus descended from a long line of mixed hands which, in a synoptic chart of Latin scripts, would appear close to the oldest *librariae,* and between them and the *epistolaris* (cursive), from which its characteristic forms were successively derived. It had a considerable influence on the continental *scriptura libraria* of the 7th and 8th centuries.

Irish and Anglo-Saxon Writing.—The half-uncial hand was introduced in Ireland along with Latin culture in the 5th century by priests and laymen from Gaul, fleeing before the barbarian invasions. It was adopted there to the exclusion of the cursive, and soon took on a distinct character. There are two well established classes of Irish writing as early as the 7th century: a large round half-uncial hand, in which certain majuscule forms frequently appear (fig. 13), and a pointed hand, more cursive and more genuinely minuscule (fig. 14). The latter developed out of the former (Keller, *Angelsächsische Palaeogr.*). One of the distinguishing marks of mss. of Irish origin is to be found in the initial letters, which are ornamented by interlacing, animal forms, or a frame of red dots. The most certain evidence, however, is provided by the system of abbreviations and by the combined square and cuneiform appearance of the minuscule at the height of its development (fig. 15; *cf.* Schiaparelli in *Arch. stor. ital.,* lxxiv., ii., 1–126).

These two types of Irish writing were introduced in the north of Great Britain by the monks, and were soon adopted by the Anglo-Saxons, being so exactly copied that it is sometimes difficult to determine the origin of an example. Gradually, however, the Anglo-Saxon writing developed a distinct style, and even local types (Keller, *op. cit.;* Lindsay, *Early Welsh Script*), which were superseded after the Norman conquest by the Carolingian minuscule. Through St. Columba and his followers, Irish writing spread to the continent, and mss. were written in the Irish hand in the monasteries of Bobbio and St. Gall during the 7th and 8th centuries.

The Carolingian Minuscule.—In Ireland, an imported quasi-minuscule hand developed into a perfect minuscule. On the continent, where the copyists of books commonly used a cursive script, it is more difficult to trace the transition from the half-uncial to the perfect minuscule, which appeared in the time of Charlemagne and is consequently known as Carolingian. The origin of this hand is much disputed. This is due to the confusion which prevailed before the Carolingian period in the *libraria* in France, Italy and Germany as a result of the competition between the cursive and the set hands. In addition to the calligraphic uncial and half-uncial writings, which were imitative forms, little used and consequently without much vitality, and the minuscule cursive, which was the most natural hand, there were innumerable varieties of mixed writing derived from the influence of these hands on each other. In some, the uncial or half-uncial forms were preserved with little or no modification, but the influence of the cursive is shown by the freedom of the strokes; these are known as rustic, semi-cursive or cursive uncial or half-uncial hands. Conversely, the cursive was sometimes affected, in varying degrees, by the set *librariae;* the cursive of the *epistolaris* became a semi-cursive when adopted as a *libraria.* Nor is this all. Apart from these reciprocal influences affecting the movement of the hand across the page, there were morphological influences at work, letters being borrowed from one alphabet for another. This led to compromises of all sorts and of infinite variety between the uncial and half-uncial and the cursive. It will readily be understood that the origin of the Carolingian minuscule, which must be sought in this tangle of pre-Carolingian hands, involves disagreement. The new writing is admittedly much more closely related to the *epistolaris* than the primitive minuscule; this is shown by certain forms, such as the open *a* (ɑ), which recall the cursive, by the joining of certain letters, and by the clubbing of the tall letters *b d h l,* which resulted from a cursive *ductus.* All palaeographers agree in assigning the new hand the place shown in the following table:

Librariae					*Epistolaris*
Capitals Uncials	Half-uncial	Rustic uncial and half-uncial	Pre-Carolingian Carolingian	Semi cursive	Minuscule cursive

Controversy turns on the question whether the Carolingian minuscule is the primitive minuscule as modified by the influence of the cursive or a cursive based on the primitive minuscule. Its place of origin is also uncertain; Rome, the Palatine school, Tours, Metz, Reims, St. Denis and Corbie have been suggested, but no agreement has been reached. (For the latest pronouncement *cf.* Steinacker in *Miscellanea Ehrle,* iv., 126 *sq.*)

In any case, the appearance of the new hand is a turning point in the history of culture. So far as Latin writing is concerned, it marks the dawn of modern times.

IV. THE RISE OF MODERN WRITING

It is impossible here to describe in detail the transformations which the Carolingian minuscule underwent at the hands of generations of clerks through the middle ages. The course of its development may be summarized in a few words. There are undeniable points of contact between architecture and palaeography, and in both it is possible to distinguish a Romanesque and a Gothic period. The creative effort which began in the post-Carolingian period culminated at the beginning of the 12th century in a calligraphy and an architecture which, though still somewhat awkward, showed unmistakable signs of power and experience, and at the end of that century and in the first half of the 13th both arts reached their climax and made their boldest flights.

The topography of later mediaeval writing has hardly been investigated at all as yet. National varieties can, of course, be distinguished. The English Gothic cursive presents certain typical forms and a number of peculiarities of outline In Germany, efforts have been made to tabulate the distinguishing features of local hands (Steinacker, *Diplomatik und Landeskunde;* Schubert, *Eine lütticher Schriftprovinz,* etc.). The problem becomes complicated as a result of the development of international relations, and the migration of clerks from one end of Europe to the other (Hajnal, *Irrastortenet az irasbeliseg felujulasa korabol,* Budapest, 1921).

During the later centuries of the middle ages the Gothic minuscule continued to improve within the restricted circle of *de luxe* editions and ceremonial documents. In common use, it degenerated into a cursive which became more and more intricate, full of superfluous strokes and complicated by abbreviations.

In the first quarter of the 15th century an innovation took place which exercised a decisive influence on the evolution of writing in Europe. The Italian humanists were struck by the eminent legibility of the mss., written in the improved Carolingian minuscule of the 10th and 11th centuries, in which they discovered the works of ancient authors, and carefully imitated the old writing. Their example was followed by many copyists. The papal chancery adopted the new fashion for some purposes, and thus contributed to its diffusion throughout Christendom The printers played a still more significant part in establishing this form of writing by using it, from the year 1465, as the basis for their types. The humanistic minuscule soon gave rise to a sloping cursive hand, known as the Italian, which was also taken up by printers in search of novelty and thus became the italic type.

In consequence, the Italian hand became widely used, and in

the 16th century began to compete with the Gothic cursive. In the 17th century, writing masters were divided between the two schools, and there was in addition a whole series of compromises. The Gothic characters gradually disappeared. A few survived until the middle of the 18th century, but since then, except in Germany, which has shown a persistent preference for the Gothic, the Italian has been universally used. Brought to perfection in recent times by English calligraphers, it is taught in schools everywhere under the name of English cursive.

PALAEOLITHIC: *see* ARCHAEOLOGY: *Iron Age.*

PALAEOLOGUS, a Byzantine family name which first appears in history about the middle of the 11th century. Michael Palaeologus (*q.v.*), son of Andronicus Palaeologus Comnenus, became the eighth emperor of that name in 1260, and was in turn followed by his son Andronicus II. (1282–1328). Michael, the son of Andronicus, and associated with him in the empire, died in 1320, but left a son, Andronicus III., who reigned from 1328 to 1341; John VI. (1355–91), Manuel II. (1391–1425) and John VII. (1425–48) then followed in lineal succession; Constantine XI. or XII., the last emperor of the East (1448–53), was the younger brother of John VII. Other brothers were Demetrius, prince of the Morea until 1460, and Thomas, prince of Achaia, who died at Rome in 1465. A daughter of Thomas, Zoë by name, married Ivan III. of Russia. A younger branch of the Palaeologi held the principality of Monferrat from 1305 to 1533, when it became extinct.

See ROMAN EMPIRE, LATER, and articles on the separate rulers.

PALAEONTOLOGY, the science which deals with the remains of animals and plants found buried in the rocks. For convenience it is now customary to use the term only for the study of fossil animals, and to deal with plants under the head of palaeobotany (*q.v.*). In essence however, the two form one science distinguished from zoology and botany by the fact that the organisms with which it deals are not all of the same age, but cover, incompletely it is true, the history of life in the world from a time not long after its appearance, when organisms capable of being preserved first arose.

Preservation.—In most cases only the hard parts of animals are capable of preservation as fossils, but under especially favourable circumstances the soft parts may be represented either by an impression upon the surrounding rock, or by stains, or even by a petrifaction which may preserve the microscopical structure of muscle and other tissues.

The preservation of any animal as a fossil depends on its burial in a sediment which is not subsequently destroyed by denudation. In the sea, the remains of marine animals are continually accumulating on the sea-bottom. They may lie in the place where they fall or, if exposed to the action of currents, be carried for considerable distances and when the speed of the current becomes insufficient to move them, be laid down, often in association with many other objects of the same area and weight. Thus it is common to find great accumulations of fossil shells all of approximately the same size, which are not necessarily in the place where they actually lived. On the other hand shells of burrowing molluscs may be found as they were in life. The remains of animals even if of such relatively permanent structure as shells are soon destroyed if they lie for long exposed to the action of the sea, and they can only be preserved if they are deposited at a place where mud or sand is being laid down. Such districts are comparatively rare and of local occurrence. They may be found chiefly where the sea-bottom off a coast is sinking. Certain special areas such as coral reefs provide exceptionally favourable conditions for the preservation of marine fossils.

On land the possibilities of preservation are much smaller. The remains of a land fauna are chiefly preserved either in the sediments which form on the bottom of lakes, or perhaps more commonly in arid areas where the general level of the land-surface is rising, because of the distribution of dust and sand over it by wind action. Under these circumstances the skeleton of a dead animal may become covered by a pile of blown sand, and may, if it escape the action of floods and wind, remain buried for geological periods. One exceptional method of preservation, more important in the case of plants than animals, is in the detritus of forests growing on a coastal plain at or below high-water mark, as do mangroves to-day. If this plain be situated in a sinking area, great masses of deposits (now represented by coal-fields) may be built up, and in them animals and plants will be abundantly preserved.

The nature of the preservation of an individual fossil depends greatly on its own chemical and physical composition, and on that of the surrounding sediments. The calcareous shells of molluscs and brachiopods, if buried in a mud which becomes converted into a clay, may be preserved indefinitely in their original form, because such rocks hinder the passage of water, which, when freely allowed, will either dissolve the shell completely or bring about a re-arrangement, often into crystals, of the molecules of which it is composed. In some cases such clays, especially if they become impregnated with petroleum, may preserve traces of the soft parts of the animal, in the form of a carbonaceous film made from its material exactly as coal has arisen from plant materials.

The most remarkable of such fossils are those from the Middle Cambrian of Burgess pass, British Columbia, described by C. D. Walcott. Here the external form even of slender soft processes of worms has been perfectly preserved and even something of their internal anatomy can be made out from colour differences in the carbonaceous films which represent them.

When buried in sand a shell is exposed to the action of percolating waters which if acid are capable of dissolving it. Its preservation is therefore dependent either on the sealing down of the sand by such a layer of clay as will prevent the circulation of water, or on a solidification of the sand by a cementing together of the individual grains, usually by calcium carbonate, which happens sufficiently rapidly to form a solid case round the shell, which may then persist if the percolating water be completely saturated with calcium carbonate, altered only by the laying down of further calcite in its pores. In many cases however the shell itself is entirely removed in solution, and its former presence is shown by a cavity in the sandstone, which reproduces the surfaces of the shell in negative (often with complete perfection).

When buried in a calcareous mud such as that which accumulates in the lagoon behind a coral reef, a shell often remains unaltered, and in a limestone which has been formed from such a mud, may be found in its original form, or changed only by the addition of more calcite. Under exceptional circumstances the material of an animal's skeleton may be removed and replaced by silica, sometimes as opal, by iron pyrites or other minerals.

Preparation of Fossils.—Before it can be studied, any fossil

must be freed as completely as possible from the surrounding matrix. The technique of this operation varies in each individual case; bones and shells, preserved in clays, can often be entirely cleaned by washing. The chitinous skeletons of arthropods and graptolites are sometimes preserved unaltered in shales, sandstones or limestones, and can then be prepared by removing the rock with hydrofluoric or hydrochloric acid. The resulting preparation can then in some cases be stained and mounted or cut into sections exactly as if it had formed part of a recent animal. Generally however the rock surrounding the fossil must be removed mechanically by needles or chisels and hammers. Where the fossil is represented by a cavity whose walls preserve a mould of its surfaces, it is necessary to make casts in plaster of Paris or more usually in wax, plasticene or glue. For small complex objects such as the skull of a fish, it is often preferable to remove the bone and rely on such casts, rather than to attempt to pick away the stone and preserve the actual bone substance. Sometimes however both rock and bone are too hard to be attacked by steel tools, and too similar chemically to be prepared by solution in acid. In these cases it is possible to discover the structure by a method invented by W. J. Sollas. By this technique one surface of the specimen is ground to a flat face on which the fossil is shown in section. An enlarged photograph is then made of this ground surface. A layer of rock of a definite thickness is then removed by further grinding and another photograph is taken, and the process is repeated until the whole of the fossil is ground away, but the appearance of the sections made across it at definite distances apart is preserved in the series of photographs. Each section is reproduced by being cut out of a sheet of wax of appropriate thickness and these wax-plates when piled up in correct order reproduce perfectly the shape of the original fossil at any magnification required. This method, though extremely laborious, leads to results which can be attained in no other way. In some cases it may be necessary to make a thousand sections, photographs and wax-plates of a single object.

The preparation of the skeleton of a large vertebrate is usually carried out with a hammer and chisel, the rock being carved away from the bones until these are free: they can then be mounted so as to form a skeleton exactly as are the bones of a recent animal.

History.—The fossil remains of animals have long attracted attention. In a Neolithic grave at Dunstable, Beds., a skeleton was found surrounded by fossil echinoderms from the chalk, and a famous silicified tree-trunk acted as a pedestal in an Etruscan tomb. Fossil shells were repeatedly observed during mediaeval times and are referred to in such works as *Agricola, "De Natura Fossilium,"* 1558. During the 18th century many works containing illustrations of fossils were published and some attempt was made to understand their structure and compare them with living forms. In one case a skeleton of *Megatherium* was actually set up in what was supposed to be its natural position in the museum at Madrid. The whole conception of palaeontology was, however, changed by the work of two men.

The first of these was William Smith (*q.v.*), a land-surveyor, who in 1791 when supervising the construction of the Kennet and Avon canal, observed that each of the well-marked formations represented in the Jurassic rocks in the neighbourhood of Bath, was characterized by the presence of fossils which could not be found in the beds above or below. Smith was able to show that it was possible by the aid of the contained fossils to trace the formations he had recognised near Bath, across the Midlands of England to the Yorkshire coast. These observations form the basis of stratigraphical geology and showed that there had been a succession of different faunas living in the English region during geological time.

Secondly, Georges, Baron Cuvier (*q.v.*) applied to the skeletons of fossil vertebrates the methods of study already developed for recent animals. In his great work *Recherches sur les Ossements Fossiles,* he gave most accurate and detailed accounts of the teeth and bones of fossil mammals and reptiles, endeavouring to build up by a comparison of many specimens the complete skeleton of a number of forms and to determine their systematic position in the animal kingdom by the methods of comparative anatomy. Finally, from a study of the skeleton he attempted to infer something of the habits of the animals with which he dealt. His work was of the first importance because it showed that many fossil animals were of types that no longer exist. Previously when only extinct invertebrates had been studied, it was always possible to say that they still lived and would one day be found when the seas of the world had been completely explored. When not one but very many large extinct animals had been shown to have existed in France and elsewhere, this possibility became less plausible; even in 1824 the world had been so well exploited that it was most improbable that many large animals remained unknown to zoologists. Indeed only two completely new types have since been discovered, the great panda and the okapi.

From William Smith and Georges Cuvier two different lines of palaeontological work have arisen. Until comparatively recently invertebrate fossils have chiefly been studied by men whose interests lay in stratigraphical geology and who used them purely as time-markers, just as potsherds are used by archaeologists. The type of work initiated by Cuvier has been carried on chiefly by zoologists and anatomists and has been concerned in the main with vertebrates.

GEOLOGICAL PALAEONTOLOGY

The geological use of fossils as time-markers rests primarily on a basis of observation of the actual occurrence of the remains of the species of animals in the rocks. Very extensive collections have shown, for example, that individuals of the genus *Productus* are never found except in rocks of Upper Devonian, Carboniferous and Permian age: that the species *Productus giganteus* can only be found in rocks whose deposition occupied a comparatively small part of Lower Carboniferous time, whilst the family Productidae lived from the Upper Ordovician to the end of the Permian. These facts are a mere matter of observation; their accuracy depends upon a correct identification of fossils, and on the extent of the collections which have been studied. The importance of stratigraphical geology for commercial purposes is so great that not only have all civilised countries been subjected to survey, but geological investigations have been conducted on an extensive scale all over the world even in such difficult regions as Spitsbergen, Patagonia, central Africa and Mongolia. Thus the extent of the evidence as to the distribution in time of the larger groups of fossil animals is very great, and we are entitled to lay great weight on the order of appearance and period of existence of such groups.

Classification of Stratified Rocks.—The divisions recognised by William Smith were marked primarily by lithological differences The Lower Lias in the Bath district is mostly clay, the Middle Lias contains hard bands of sandstone known as marlstone, the thin Upper Lias is predominantly limestone, the base of the Inferior Oolite is merely unconsolidated sand and so on. It was in such formations readily separable from one another by inspection that Smith collected the fossils on which he founded his generalisation that geological formations could be identified by the fossils which they contained

Later workers extended this conception and used it for the division of the stratified rocks of the world into systems originally distinguished from one another by the character of their fauna. Thus R I. Murchison separated off a great series of formations as the Silurian system, because of the occurrence in them of certain fossils, trilobites and graptolites for example, which do not occur or are rare and inconspicuous in later geological time. The character of the basis on which this system was formed was made clear by the famous long-continued discussion between Murchison and Adam Sedgwick. The latter had mapped North Wales, dividing up the rocks of which it is composed into formations and grouping the whole in the Cambrian system. When after the establishment of the Silurian system by Murchison, the fossils collected by Sedgwick came to be examined, it was discovered that the whole assemblage of Sedgwick's Cambrian fossils was that which characterised the Silurian system, and Murchison claimed that the term Cambrian was synonymous with Silurian. Thus the two conceivable methods of dividing stratified rocks into groups on the basis of their lithology and of their palae-

ontology were placed in opposition and the true nature of the differences had to be considered.

It is certain that every change in the character of sediments depends on a modification of the geography of the region in which they were being laid down, and that in those cases where successive rocks have an unconformable relationship to one another, there is an interval of time separating the two. It is now evident that the changes in the fauna which distinguish one formation from another are to a great extent the result of the evolution which has proceeded during the time separating the deposition of the sediments involved. Thus the evidence from stratigraphy and from palaeontology should lead to the same conclusions. But the changes in fauna, depending as they do on evolution which proceeds with time, should occur whether or not the geography is so altered as to cause a modification in sedimentation. It should therefore be possible on palaeontological grounds to divide the rocks of a single geological formation into smaller periods not necessarily recognisable by lithological differences but displayed by a change in fauna. The first geologist to do so was Oppel, who divided the Lias into small periods which he called zones. Technically a zone consists of the sediments which were laid down during the period of existence of a particular species of animal. In practice it is usually found that they are most readily recognised not by the presence of a single species but by the coexistence of a group of forms not one of which is necessarily present in each locality where the zone occurs.

Zones.—This process of dividing rocks into small divisions has been carried to an extreme length among Jurassic and Cretaceous sediments, but has to some extent been applied to all systems. The Cambrian system, divided into groups primarily on the lithology of the sediments of that age in north Wales, has been sub-divided into some 12 zones, chiefly on the evidence afforded by the range of different genera or species of trilobites. The succeeding Ordovician and Silurian systems were shown by Charles Lapworth to be divisible on the evidence of graptolites, and it has since been found that these graptolite zones can be recognised not only in the region of south Scotland, where they were established, but throughout western Europe, North America and even Australia. They are thus of world-wide significance.

Facies.—In the course of his work, Lapworth emphasized the fact that the Ordovician and Silurian rocks of south Scotland existed in two different forms—sandstones, shales and limestones, containing trilobites, the shells of brachiopods and molluscs, and corals; and very thin-bedded usually black shales often crowded with graptolites but usually yielding very few other fossils. He called these two rock types the "Shelly" and the "Graptolite" facies respectively. Owing to the occasional occurrence of graptolites in the shelly facies, he was able to show that the difference between the faunas of the two types did not depend on differences of time, but could be completely accounted for by the assumption that the rocks of the shelly facies were laid down near the coast in shallow water, where trilobites and shells were living. The graptolite shales on the other hand were deposited in relatively deep water and the graptolites whose remains were found in them were pelagic animals floating freely in the sea, their skeletons after the death of the colony sinking to the bottom and becoming buried in the scanty sediments which were there accumulating. The conception that two faunas of identical age may differ even completely on account of such a difference of facies, is a most important one, which has always to be kept in mind in discussing the geological age of any rock. Modern work on the distribution of animals on the floor of the Kattegat, the North Sea, and the English Channel, has shown conclusively that in very short distances, in some cases within a few hundred yards, totally different forms may be lying buried in the sea bottom; the character of the fauna being determined in part by the nature of the soil, whether gravel, sand or mud, in part by the depth of water. (*See* MARINE BIOLOGY.)

The fact that graptolites are unattached forms living floating in the surface layers of the water, explains the occurrence of their skeletons in both the shelly and graptolitic facies, and also accounts for their extraordinarily wide distribution, whilst the fact that they were undergoing a rapid evolution is the explanation of their value for recognising small periods of time. The graptolite zones of the Palaeozoic, however, probably cover long periods of time in comparison with those which are recognised in Jurassic rocks. Throughout the Mesozoic, zones have been established on the basis of the ammonites. These animals are often enormously abundant as individuals and were undergoing very rapid evolution from their first appearance at the base of the Permian to their disappearance at the top of the Cretaceous. Many of them are found in sediments of all types, individuals of the same species may be buried in sandstones, shales or limestones, a fact which suggests that like the graptolites, most of them at least did not dwell on the sea-bottom but swam freely in mid-waters or near the surface. These habits would explain the wide geographical range which some of them are known to have covered. For example, the same or closely similar species of *Mortoniceras* occur in Texas, India, South Africa and Europe.

Ammonite zones may be and have been established in all marine sediments up to the top of the Cretaceous, but when we pass to Tertiary formations we enter into conditions in which no group of marine animals can be used for a world-wide division into zones. The difficulty of subdividing the Tertiary period in all probability is to be accounted for by the absence of any group of highly developed pelagic forms undergoing a rapid evolution and capable of ready preservation as fossils. A survey of the present fauna of surface waters, especially of those not entirely coastal, suggests that the most valuable groups for zonal purposes in the Tertiary would be the whales, whose size and rarity renders them unavailable; and the copepods which are, except in very special cases, incapable of preservation. Thus the subdivision of the Tertiary period, so far as rocks of marine origin are concerned, necessarily rests on bottom-living forms from shallow seas, such as the Foraminifera, Gastropoda, Lamellibranchia and Echinoidea. It is perfectly clear from the present-day distribution that species belonging to the last three groups have in general a restricted geographical distribution, and that they are very sensitive to changes of facies. The fundamental nature of the shortcomings which such materials possess when used as time-markers is vividly illustrated by the uncertainty which still exists as to the ages of the Tertiary deposit of Australia and South America. Indeed the Foraminifera, unsatisfactory as they theoretically should be, seem on the whole the most suitable fossils for determining the correlation of Tertiary rocks, at any rate over such a part of the world's surface as experienced tropical or warm conditions.

Foraminifera and such other small fossils as Ostracoda have recently attained a new and special importance in stratigraphical geology, because they can be determined in the fragments fetched up from bore-holes made with a jumper. The exploratory bores made very extensively to prove oil-fields yield such material, the investigation of which has become a special branch of palaeontology now actively pursued because of its economic importance especially by American workers.

Establishment of Zones.—The zones so far considered rest entirely on an observational basis. They have been defined by recording the observed distribution of particular species in a series of rocks whose succession can be determined by mapping. It is clear that their validity depends entirely on the certainty with which the individuals of a species can be recognised and on the extent to which collections have been made. The business of a geologist intent on establishing zones is to collect as many fossils as possible from each bed of a well-exposed series, and then in the presence of the whole material to draw the limit of his species as finely as he can. That is, to indicate by a name (to be regarded purely as a method of handling the facts) each type of organism which can be distinguished from all others by observable and constant morphological characters. Theoretically such groupings should be made without reference to the beds in which the individual fossils have occurred, but in practice it is usually found that recognition of the more minute differences in structure is rendered much easier if the relative ages of the specimens under consideration be taken into account. Nevertheless, this practice

universally and necessarily pursued, introduces the danger that the optimism of the student may lead him into the acceptance as permanent and characteristic, of features which are not such in fact.

For full use to be made of the information acquired by the process suggested in the preceding paragraph, it is necessary to compare the species of fossils which have been thus recognised, with materials from other parts of the world. As very few museums possess collections from all over the world and as these will in any case be inadequate, such a comparison can only be made with fossils previously described. It is therefore a primary duty of a palaeontologist to publish detailed descriptions illustrated by accurate and clear figures of the forms he recognises, but he may only do so after he has compared his own specimens with the whole of the published accounts of similar creatures. This process is extraordinarily laborious and tedious but is rendered far easier if there is a modern monograph of the whole group involved. After each individual fossil of the collection has been referred to a definite species, it is easy to discover whether any of them are restricted to a definite bed or series of beds, and it is then necessary to consider whether the absence of a given species at any particular horizon is due to the age of those rocks, or can be accounted for by a change of facies, which will in most cases be indicated by a change in the lithology. Life-zones are intended to be founded on the period of existence of a definite species of animal, and hence should have a validity throughout the entire region in which the animal in question lived. Thus zones should not be established, although they may be tentatively put forward, until it can be shown that they are recognisable over some area which represents a fair sample of the probable space-range of the species.

As it is known from present-day conditions that no individual species of sedentary animal which lives in shallow seas, occurs uniformly distributed over any area even so small as the English Channel, it is clear that the non-occurrence of the zone-fossil at any place does not necessarily imply that deposits of its zone are absent there. Thus even in rocks not lithologically dissimilar, the same zone may contain different faunas in places only a few miles apart.

If the zonal fossil be a pelagic form whose remains only secure burial after they have sunk from the surface to the sea-bottom, then within wide limits its occurrence should be independent of the nature of the sediments, and its distribution, depending as it will do on currents which change from season to season, may be expected to be uniform when periods of time exceeding a few years, are considered. Thus the non-occurrence of a pelagic zonal fossil in an area within which its remains are found, assuming that the collections are adequate, is good evidence that sediments laid down during its zone, were either not deposited or have subsequently been removed. The very detailed zoning of Jurassic rocks which has been established in England by the work of S. S. Buckman and his successors has shown that such failures of sedimentation or local unconformities are exceedingly common in shallow water deposits, and that they may be entirely unrecognisable by ordinary stratigraphical methods.

Palaeogeography.—In addition to their value as time-markers, fossils may throw light on the geographical conditions under which rocks were laid down, and on the palaeogeography of the world as a whole. Certain groups of animals are now, and, so far as our knowledge extends, always have been, restricted to salt water; no echinoderm, for example, is ever found in rivers or lakes. Although a few forms (none capable of preservation as fossils) do occur in fresh water, the Coelenterata, as a group, are marine, and the occurrence of a coral is almost conclusive evidence that the rocks in which it was found were laid down under the sea. Brachiopods are equally marine, but *Lingula* and presumably some of its allies extend their range into brackish, though not into fresh water. In most cases, however, a phylum may have representatives both in the sea and in fresh water, but even in these cases it will usually be found that many of its larger divisions are restricted to one or the other habitat. Thus the Mollusca have four great groups, the Solenogastres, Polyplacophora, Scaphopoda and the Cephalopoda, all of whose members are marine, whilst the other two, the Gastropoda and the Lamellibranchia, occur both in fresh and salt water, the former group also inhabiting the land.

The actual structure of the hard parts of an animal may indicate whether it lived on land or in water, but can never present any direct evidence on the problem of the nature of the water in which it lived. Thus the whole geological use of a fossil as an indicator of the marine or fresh water origin of the rocks in which it is found depends on the accuracy of the determination of its affinities primarily with living forms whose habitat is known, and secondarily on its association with other organisms which are shown to have been marine by independent lines of evidence. But it is possible from the structure of a shell to determine something of its conditions of life. For example, those Mollusca which live between tide-marks on the sea-shore have to resist the full force of wave-action, and can only do so if they bury themselves in sand, lie concealed in cracks in rocks, or, like *Purpura*, have a shell so thick and massive as to stand hard blows. Forms like limpets, with their conical shell held down tightly to a fixed rock surface, escape displacement and destruction because of their shape. Lamellibranchs depend for the whole of their food-supplies on suspended particles in water-current which is caused to pass over their "gills" by ciliary action. Thus a lamellibranch which lives buried in sand, must maintain contact with the sea-water by a double tube long enough to stand out above the floor of the sea. The former presence of this great siphon is usually shown by a gaping hole left at the posterior end when the two valves of the shell are closed. By this means the habitat of certain forms may be discovered by their structure.

Such organisms as live in deep water are not exposed to the risk of mechanical damage by currents. Their shells need be no more massive than is necessary for the maintenance of the shape of the animal, and hence as a whole deep-sea echinoids, lamellibranchs and brachiopods are characterized by the excessive tenuity of their skeletons sometimes so thin that the animal can scarcely support its own weight in air.

Fossils and Climate.—Appeal is often made to fossils in discussions as to temperature under which certain formations have been deposited. For example, it is stated that such an extensive development of corals as occurs in the Coral Rag of Mid-Jurassic age, implies that this sea was at that time tropical. This conclusion is based entirely on the fact that at the present day coral-reefs are only found in the tropics or some few hundred miles on each side thereof. This rests on an observational basis and there is nothing in the structure of the coral individuals to explain it. The coral *Lophohelia*, which forms great branching colonies two feet in height, lives in the cold deep waters of the Norwegian fjords, and off the coasts of Scotland. This animal and others which occur with it, differ in no consistent respects from allied tropical forms. Thus the mere occurrence of corals provides very unsubstantial evidence on which to found an interpretation of the temperature of past seas. If this doubt be present in Jurassic times then it is quite clear that abundance of corals in Palaeozoic rocks affords no evidence whatsoever as to the temperature, especially as the phylogenetic relationships between Palaeozoic and Mesozoic corals are quite uncertain. In the case of rocks of Pleistocene and late-Tertiary age in which the remains of living species are found, however, it is possible to use their evidence in following the course of temperature changes during the period of their deposition.

Most living species of marine animals have a distribution which is limited by temperature. Such fish as the haddock can live and breed only in waters whose upper and lower temperature limits are strictly defined, and it is reasonable to suppose that this disability has existed from the time of their origin. Thus the discovery of such an animal as *Haliotis* (whose present northern limit is the Channel Islands) in late Tertiary rocks in England, would imply that there has since been a fall in temperature in the sea surrounding the British Isles. It is, however, clear that such evidence must be used with caution and that it becomes more fragile the further back the species be traced.

To-day, the faunas of the land, fresh waters and shallow seas are not uniformly distributed over the world. For example, each of the great land-masses has a fauna, which taken as a whole, is peculiar to it, and as the present distribution reflects the history of the individual forms, it is to be expected that similar zoogeographical regions should be recognisable at every geological period. In fact it is found from the evidence of mammals that in Oligocene times North America, Mongolia and Europe, Africa, Australia and South America formed independent provinces. Some facts of the distribution of ammonites suggest that in Cretaceous times a similar regional arrangement occurred in the seas. Owing to the difficulty of being certain that the observed faunal differences in this and similar cases do not really depend on the absence of deposits of identical age, it is rarely possible to determine the limits or indeed the real existence of palaeo-zoo-geographical regions in the sea.

It has often been stated that in past times the distinction between the climates of the tropical and temperate zones was far less pronounced than it is to-day. This statement is based on the fact that certain floras and faunas, the marine fauna of the Lower Carboniferous, and the Rhoetic flora, for example, spread uniformly over the world, and that their remains may be found indifferently in the tropics and within the Arctic circle. It is difficult to conceive of any circumstances which could have greatly modified the existing arrangement, and the wide distribution of certain faunas must be accounted for either on a basis of inadequate discrimination of species, or on a greater adaptability of the animals concerned to temperature changes. There are, in fact, certain cases where the distribution of fossil animals can only be accounted for by the existence of such temperature belts. Thus comparison of the fauna found in the Upper Marine series of Permian age in New South Wales, which from the occurrence of isolated glacial blocks on it, is known to have been formed under conditions analogous to those now existing in the Antarctic seas, with the Permian faunas of the Himalayas, which cover the same period shows conclusively that we are here dealing with the results of temperature differences. The two faunas are completely dissimilar and it is most improbable that this can be accounted for by varying facies.

THE SUCCESSION OF FAUNAS

Pre-Cambrian deposits of the age of the Algonkian and Torridonian often exhibit traces of animal life in the form of tracks and burrows similar to those made by living marine "worms," but determinable remains of animals are exceedingly rare in them. C. D. Walcott has, however, described a small fauna from North America, which is remarkable for its resemblance to that which is found in the succeeding Lower Cambrian.

Cambrian.—In the Cambrian characteristic representatives of nearly all the phyla of the animal kingdom are found. Protozoa are represented by typical radiolarian skeletons, but Foraminifera are as yet unknown. Sponges are represented by a lithistid in pre-Cambrian rocks, although not actually in the Lower Cambrian. *Protospongia* is a hexactinellid found rather abundantly in Cambrian rocks in North America and Europe. The peculiar group Archaeocyathidae, which is usually considered to belong to the Coelenterata, but appears to differ fundamentally in structure from all representatives of that phylum, is entirely restricted to Cambrian rocks and its members occur all over the world. The normal coelenterates are, however, represented by impressions of jelly-fish in the Cambrian of British Columbia and in Upper Cambrian times the first graptolites appear in the form of *Dictyonema* and its allies, together with a few representatives of the higher group, Axonolipa.

The Echinodermata are represented in Cambrian times by three classes, the Cystidea, the Crinoidea and the Holothuria. The Chaetopoda are represented by perfectly characteristic animals from the Middle Cambrian of Canada, in addition to many worm-castings, and one form from the same rocks is plausibly attributed to the Gephyrea, whilst another appears to be related to the living arrow-worm *Sagitta,* which belongs to the phylum Chaetognatha. No Cambrian representatives of the Platyhelmia, Nemertina or Nematoda are known, but these phyla are unrepresented as fossils at any period. The Brachiopoda provide perhaps the most abundant of all Cambrian fossils and certain groups are restricted to rocks of that age. During Cambrian times, however, the articulate brachiopods are rare and the Telotremata, the most advanced of these, are completely absent. Cambrian Bryozoa are unknown, and the Podaxonia are unrepresented as fossils at any time. Certain of the classes of the phylum Mollusca appear in the Cambrian. The Lamellibranchia are perhaps represented by forms belonging to the primitive division Taxodonta, but are in any case very rare. The Scaphoda, a small and inconspicuous group, are not known before Silurian times, and the Polyplacophora, always rare, are of later introduction.

Amongst the Gastropoda several forms, the primitive and purely Palaeozoic Bellerophontidae, the Euomphalidae and the still-living Pleurotomariidae occur in the Cambrian. The limpets are also represented and the group Pteropoda is abundantly present if the Hyolithidae be correctly placed amongst them. The highest division of the Mollusca, the Cephalopoda are apparently represented in Cambrian times by members of the sub-order Nautiloidea, but there is perhaps some doubt as to the correctness of the identifications on which this statement rests. The more advanced division of the cephalopods, the order Dibranchiata, is clearly of much later introduction. The group of the Arthropoda is well represented, but the majority of the forms known belong to the special Palaeozoic group of the Trilobita (*q.v.*). The Phyllopoda are represented by a few forms from the Middle Cambrian Burgess shale of British Columbia, and by other *Apus*-like creatures from other deposits, but the morphology of these animals is still so incompletely known that their relationships are uncertain. The higher group Phyllocarida is represented by many incompletely known animals widely distributed in the Cambrian, but its more advanced groups are certainly of later introduction. The group of the Arachnoidea, which includes spiders and king-crabs, has several Cambrian forms, grouped in the order Merostomata, which are clearly far more primitive in structure than the later forms. The air-breathing myriapods and insects are absent from Cambrian rocks, and the vertebrate phylum is unrepresented.

Thus the Cambrian fauna, although it includes members of all the invertebrate phyla which occur as fossils, and although certain species are represented by multitudes of individuals, is none the less a restricted one, despite the high specialisation, probably of an adaptive nature, which certain of its members exhibit. There is a marked uniformity amongst the members of each of the great divisions, the range in structure presented by them being far smaller than that which is found at any later period of the earth's history. The occurrence of so many phyla, already sharply separated from one another, and with their characteristic and typical structure fully developed, implies that the animal kingdom had had a long history in pre-Cambrian times, and the rarity of pre-Cambrian fossils can only be explained by the fact that the early members of all phyla were unprovided with hard parts capable of ready preservation as fossils. That this explanation is justified, is indicated by the fact that, taken as a whole, the Cambrian animals themselves had delicate skeletons primarily of chitin, calcareous shells being rare and when found thin, when compared with the corresponding structures of Ordovician and later forms.

Ordovician and Silurian.—In the succeeding Ordovician and Silurian periods the range of structure amongst the members of each tribe becomes much greater, a fact which is reflected in the successive appearance during this time of new divisions, classes, orders and families, whilst the majority of those already existing in Cambrian times pass onwards, exhibiting increased specialisation as they do so. Thus amongst the Protozoa, Foraminifera make their appearance. Many groups of sponges appear and amongst the Coelenterates higher orders of graptolites are predominant over the Cambrian dendroids. The Anthozoa become represented by simple and then by compound corals belonging to the Tetracoralla, and the Tabulata represent the Aleyonaria. The Echinodermata display an enormous development of cystids, crinoids and asteroids and a few blastoids, edrioasteroids and echinoids appear. The Brachiopoda branch out in a similar manner, the articulate forms

attaining a predominance both in numbers of species and in individuals. Amongst the Mollusca some 19 families of Lamellibranchia and a dozen of Gastropoda are first found, whilst the Nautiloidea are represented by about 2,000 species during the period. The Arthropoda undergo a similar expansion, new families of trilobites making their appearance, the Malacostraca becoming more abundant and varied, and the Merostomata exhibiting not only a great increase in individual size but also a marked adaptive radiation. Scorpions first appear in a form apparently not yet fully adapted for life on land. Finally perhaps at the top of the Ordovician, certainly in the Middle Silurian, the vertebrates appear in fish-like forms allied to the recent lampreys and hagfishes, and perhaps in true fishes belonging to the Acanthodi.

Devonian.—The succeeding Devonian period is rendered notable by the incoming of definite fishes. The Chondrichthyes are represented not only by acanthodians, but by forms more closely similar to the sharks, as well as by the heavily armoured Arthrodeira, whilst three distinct groups of bony fishes appear. Amongst the invertebrates, every phylum exhibits the addition of new families and higher groups, but the general character of the marine fauna remains the same, though the graptolites and trilobites, the most characteristic of all Lower Palaeozoic animals, become rarer both as individuals and as species during Devonian times, one family after another of them becoming extinct. The Nautiloidea also become less abundant and less varied in their structure, their place being taken by members of the new order Ammonoidea, which make their first appearance in the Devonian or possibly towards the end of Silurian times. In the Devonian we get the first indication of true land-forms, the most striking being perhaps the centipedes from the Old Red Sandstone of Scotland.

Carboniferous.—In the Carboniferous we have a marine fauna which, whilst in the main representing a mere continuation of that in Devonian times, is none the less characterised by the disappearance of the Receptaculida amongst the sponges, of many corals and of the graptolites amongst the Coelenterata, of some crinoids and all cistids, amongst the Echinodermata, and of many families of Brachiopoda. In their place we have a great expansion of the blastoids, asteroids and echinoids, and of both the lamellibranchs and gastropods among Mollusca, whilst the ammonoids become more abundant and more highly organised, passing up to forms which are the precursors of the great development which occurs in the Permian and Trias. Amongst the arthropods the trilobites survive only in a single family, but certain forms belonging to the Syncarida and Schizopoda represent a modern type of development of the Malacostraca. The Merostomata are reduced in numbers and variety, but true scorpions and forms which are allied to the phalangers and spiders occur, together with representatives of the extinct group Anthracomarti. Myriapods become of gigantic size and insects are represented by a very large number of forms belonging to primitive orders, many of which bridge the gaps between existing groups. The heavily armoured forms which represented the cyclostomes in Devonian times become extinct as do the arthrodeires. Elasmobranchs of many types are abundant and some of them exhibit the beginnings of structures which characterise the living Selachii. The bony fishes belonged to the three groups which appeared in Devonian times but one of them, the Palaeoniscidae has become far more abundant and varied in structure whilst the others are declining. The most important occurrence in Carboniferous times was the appearance of land-living and air-breathing vertebrates, Amphibia, and at any rate towards the end of the period, reptiles.

Permian.—The marine fauna of the Permian is in the main a mere continuation of that which existed in Carboniferous times, but it is characterised by its poverty, perhaps only because marine deposits of Permian age are rare. Most of the characteristically Palaeozoic groups of invertebrates die out either during or at the end of Permian times. Amongst such groups are the Tetracoralla, all of the then existing families of crinoids, the blastoids and edrioasteroids and all the families of brachiopods, except those still extant, and four represented by rare forms in the Trias and the lower Jura. On the other hand all the families of Mollusca which were in existence in Carboniferous times pass on through the Permian into the Mesozoic and indeed in most cases still live. During this period the great order of the ammonoids undergoes an expansion, new families being introduced, whilst the members of the earlier groups become more elaborate in structure. The trilobites are represented by one genus only and that is restricted to the lower part of the system. The most characteristic features of the Permian fauna are displayed by the vertebrates. Amongst the fish, the elasmobranchs are represented by comparatively few forms, many of the more characteristic Carboniferous families having died out. The bony fish show a definite advance in the incoming of forms derived originally from a palaeoniscid stock which are the forerunners of the abundant Mesozoic ganoids. The Amphibia include the descendants of those which lived in the Carboniferous but were in many cases much more terrestrial in habits. The reptiles on the other hand become extraordinarily abundant and varied in structure, exhibiting many evolutionary series which lead on to the mammals and to the higher reptilian orders from which the birds arose. It is probable that in late Permian times the reptiles were more varied than they have ever been since.

Triassic.—Triassic times saw the introduction of the Hexacoralla amongst the coelenterates, of special families of crinoids and the first introduction of the modern echinoids in the form of the diademoids derived from *Cidaris,* and leading on to all the other existing families. The brachiopods, although varied, belong to very few families and from this point onwards, except for the occasional abundance of individuals of a few species, play a subordinate part in the fauna. In association with this regression of the brachiopods we find an increased importance of the lamellibranchs, an increase which is paralleled and even exaggerated in the case of the gastropods; but the most characteristic Triassic molluscs are the cephalopods. During the Triassic times the ammonites became extraordinarily abundant, varied in type, and remarkably elaborate in structure. Some of them represent the culmination of families which had existed in Permian times, many originated in the Trias and did not survive that period, only one, the Phylloceratidae appearing first in the Upper Trias, lives on into the Jura to provide one of the two main stocks from which all other ammonites seem to have been derived. Concurrently the Nautiloidae exhibit a reduction in numbers and in range of structure, but the dibranchiate cephalopods, structurally the most advanced members of that group, first appear in the Trias in the form of a forerunner of the belemnites. Amongst the Crustacea the most important innovation was the introduction of the Decapoda, which have since become the leading group, whilst the single well-known Triassic insect fauna contains representatives of many families which are less archaic than those from the Carboniferous, leading up to the modern types.

The end of the Trias saw the disappearance of all the elasmobranchs except the Selachii, and the osteolepids, which do not survive the Permian, are represented only by their descendants the coelacanths. The Dipnoi are reduced to the single genus *Ceratodus,* which lived indifferently in fresh and salt water. Amongst the Actinopterygii the palaeoniscids, although still abundant, play a less and less important rôle, many families of "lepidosteoid ganoids" making their appearance and living on to become the predominant fish in the Jura. Three of the Palaeozoic orders of Amphibia had become extinct at the end of the Permian and the labyrinthodonts, although gigantic in size and world-wide in distribution, form a much less varied assemblage than their ancestors in the Permian. One family of them, however, took to the sea and provided the only known cases of Amphibia living in salt water.

During the Trias the Reptilia continue their evolution, the majority of the Permian orders living on in the form of advanced descendants, whilst new orders, the "dinosaurs" and Chelonia make their appearance on land and the seas are invaded by the unrelated groups of the ichthyosaurs, plesiosaurs and thalattosaurs. Finally there is some evidence that the pterodactyls were already flying by the end of the Trias. But the most important single event is the occurrence in the Upper Trias of mammals belonging

to the sub-class Multituberculata.

Jurassic.—The Jurassic fauna exhibits the appearance of a few families of Hexacoralla and of crinoids. In it the irregular echinoids make their appearance to undergo a rapid development in forms adapted to varied habitats, whilst the regular echinoids also branch out into new families. Amongst the brachiopods are found only the living families, together with three which died out in the Lias. Amongst the Bryozoa the now dominant group of Cheilostomata first appear. New families of lamellibranchs and gastropods were introduced, whilst the ammonites display an extraordinarily rapid evolution, the two fundamental stocks giving origin to thousands of species and hundreds of genera, abundant as individuals, sometimes wide-spread geographically but of very limited duration in time. The Dibranchiata were represented not only by the belmnites but also by forms which made a much closer approach to living *Sepia*. Amongst the arthropods, Brachyura (crabs) are added to the Macrura and amongst the insects such advanced types as the Diptera occur, together possibly with butterflies. The elasmobranchs are now entirely selachians and skate-like forms make their appearance, whilst the Holocephala become comparatively abundant and soon obtain a structure which is in all essentials identical with that of the living members of the group. Amongst the bony fishes the coelacanths live on without alteration of their structure, and the Dipnoi leave the seas of the world. Amongst the Actinopterygii the palaeoniscids are rare and little varied, whilst both salt and fresh water were occupied by abundant and very varied lepidosteoids, together with a few species, but abundant individuals, of a group Leptolepidae apparently ancestral to the Teleostei, which includes the vast majority of recent fish. Only two Jurassic Amphibia are known, a typical frog and a newt. The reptiles were still a predominant group of vertebrates, but many of the Triassic orders had become extinct, and the real range and structure which they exhibit is much smaller. The "dinosaurs" flourished on land in all parts of the world and were accompanied by tortoises, Rhynchocephalia and lizards. Pterodactyls almost as uniform in structure as the birds of to-day occupied the air and seem to have led a life similar to that of a gull. The ichthyosaurs and plesiosaurs are joined in the ocean by crocodiles and turtles. In all habitats gigantic forms appear, paralleling roughly the adaptive developments later made by mammals. The first birds are represented by two skeletons of a primitive structure from the Lithographic stone of Bavaria. The Jurassic mammals are all small, none having a skull exceeding three inches in length, but they belong to three sub-classes, one of which is possibly related to the ancestry of the living marsupials.

Cretaceous.—The marine fauna of the Cretaceous exhibits in the main a continuation of that of the Jura; but certain families of Alcyonaria make their appearance. The echinoids exhibit the incoming of some new groups of which the most important is that of the heart urchins. The brachiopods are still further reduced in variety and the Polyzoa become still more abundant, largely on account of the dominance of the Cheilostomata. Many new families of lamellibranchs and gastropods are introduced, but the ammonoides become less varied, disappearing altogether at the close of Cretaceous times. Before they do so they branch out into curious forms in which the shell comes unrolled to a varying extent, and certain other forms exhibit a return to a simplicity of structures which vividly recalls that of certain Middle Triassic ceratites.

Amongst the fish, the elasmobranchs are with few exceptions modern in type. Even such specialised forms as the goblin sharks are represented by species belonging to an existing genus. None the less, certain Tertiary selachians, the eagle rays and sawfish have not yet appeared though their ancestors are found in Upper Cretaceous rocks. The Mesozoic "ganoids" are rare and little varied, the great bulk of the bony fish being teleosts belonging to the more primitive families, although in some cases to genera which still exist. Amongst the reptiles the dinosaurs and pterodactyls reach their largest size to vanish with the end of the period, whilst the seas contained mosasaurs in addition to ichthyosaurs, plesiosaurs and Chelonia. In fresh waters in the Upper Cretaceous an aquatic rhynchocephalian *Champsosaurus* makes its appearance and the first snakes are found in the Upper Cretaceous limestones of Istria and in Patagonia. The few known Cretaceous birds belong to a super-order characterised by the possession of teeth, certain of them being adapted for powerful flight, whilst the remainder were aquatic with hind-legs modified to form paddles and the wing even more reduced than that of a penguin.

The majority of the Cretaceous mammals belong to the same groups as those which existed during the Jura, but a few forms can be shown to be closely related to the Opossums and others recently found in Mongolia are of great importance because they have every appearance of being the ancestors of the placental mammals.

Tertiary.—The Tertiary period has seen the rise and development of all the higher groups of animals. In the sea the modern corals belonging to the Hexacoralla become dominant. Amongst the Echinodermata the asteroids show extremely little change in type, and the ophiuroids pass on little altered. The echinoids are, however, of very different appearance, such animals as *Clypeaster* and the cassidulids becoming very abundant and the group of the Spatangidae branching out into a great variety of forms. The brachiopods are reduced to the still existing families and become rare both as species and as individuals. The Mollusca on the other hand become even more varied and abundant, new families of lamellibranchs and gastropods arising and few dying out. The most striking change, however, is the complete disappearance of the ammonites and belmnites; the Octopods known from the Upper Cretaceous becoming very abundant in the recent seas. Amongst the arthropods, the decapods become increasingly abundant whilst it has been demonstrated conclusively that all the orders of insects were in existence early in Tertiary times.

Tertiary fish represent a development of those present in Upper Cretaceous times, and are on the whole of little interest. The reptiles become reduced to those orders which still live. The Chelonia, lizards and snakes undergo a rapid evolution branching out to fill many different types of habitat, whilst the Rhynchocephalia and crocodiles present no new modifications. Thus the most characteristic Mesozoic reptiles, dinosaurs, pterodactyls, ichthyosaurs, plesiosaurs and mosasaurs die out during or at the end of the Cretaceous period. It is an interesting point however that the marine Chelonia and champsosaurs live on into Tertiary times.

The most important feature of the Tertiary faunas is however the "adaptive radiation" which takes place amongst the birds and mammals, leading up in the latter group to man himself. For the details of this process reference should be made to the articles MAMMALIA and ORNITHOLOGY.

EVOLUTIONARY EVIDENCE

The knowledge of the distribution of animals in time summarised above is founded on an immense material. Many millions of fossils have been examined by palaeontologists during the past century, and the conclusions resulting from their investigations cannot be seriously modified by the unexpected discovery of animals before or after the period to which we believe them to have been restricted. The whole story of the history of life may be summed up thus:—In the Lower Cambrian, representatives of all phyla of invertebrates capable of ready preservation as fossils, are present, but within each phylum they exhibit little range in structure and on morphological grounds are regarded as of low organisation. In succeeding periods the variety of structure exhibited by the members of each phylum becomes greater, a fact which is expressed by the steady increase in the number of families which are recognised. The higher families come in steadily one after the other and certain groups achieve a dominant position, vast numbers of species and of individuals being found all over the world. These dominant groups die out not by a sudden extinction but by a gradual decrease of the numbers of families, species and individuals. Amongst the vertebrates that group which from its structure has always been regarded as the most

primitive, the Cyclostomata, is the first to appear and is followed successively by the fish, Amphibia, reptiles, mammals and birds, these groups making their entrance in the order which would have been expected from their structure. The whole phenomenon of the geological occurrence of animals provides the most important single piece of evidence which exists for the truth of the theory of evolution. Darwin in the *Origin of Species* expressed his belief that it was to the evidence of fossils that we must turn for support of the evolution theory, and since his day a large part of the energies of palaeontologists have been devoted to the study of the relationships of extinct animals and to an attempt to trace the actual lines of descent which they exhibit. The phylogenies which have been drawn up by palaeontologists are of diverse types; they may merely illustrate the evolution of group from group, or they may display the mode in which one species has arisen from another, but the mode by which they have been derived is the same in all.

Phylogenies.—The first step in the construction of a phylogeny is to determine that certain animals whose remains are known from rocks of different ages are in fact related to one another. This can only be done by finding that a common plan of organisation runs through all of them and that they are held together and distinguished from associated and related forms by the possession in common of certain characters, which persist unchanged or little altered from the earlier to the later animals. Such characters, called palaeotelic, are often inconspicuous and difficult to discover. Amongst vertebrates they are to be found in such regions as the brain-case and ankle-joint, which are little exposed to adaptive changes. The certainty with which it can be shown that a series of animals of different ages are in fact related to one another, depends entirely on the number of palaeotelic characters which can be discovered in their structure. Thus far greater certainty can be attained in the case of animals with complex skeleton, such as vertebrates and echinoids, than in such creatures as Mollusca and graptolites, whose skeleton is simple.

When by this method a series of allied animals has been sorted out from amongst its contemporaries, the earliest of them should be compared with the most recent. Such a comparison will bring out differences capable of being recorded. Those members of the series which are of intermediate age must then be compared with the beginning and the end, and the nature of the differences which they display considered with respect to the changes which separate the first and last of the series. If the series has been correctly discriminated it will usually be found that all the forms fall into order, each differing from that which precedes it in the same ways as its successor differs from it.

Micraster.—The best case of such an evolutionary series, illustrating the origin of species, is that presented by the genus *Micraster*, a heart-urchin, found commonly in the Middle and Upper Chalk of England; this case was described by Dr. A. W. Rowe. Dr. Rowe collected 2,000 examples of echinoids from the chalk of the south of England, the geological horizon of every individual being accurately recorded. He then measured all these specimens and, having taken microphotographs of the details of their structure and compared the whole group of specimens from each zone with the other similar groups, decided that 18 different characters could be recognised in each test, and for each of these characters he compared the whole group of forms from each zone with that from every other zone. As a result of this comparison he was able to show that for most of the 18 characters, there was a change from the earliest to the most recent assemblages and that the *Micrasters* from each of the five zones he considered, differed from their predecessors as their successors differed from them.

For example, the character whose evolutionary change is perhaps most readily illustrated is that presented by the paired ambulacra: each one of these structures consists of a strip of the surface of the skeleton of the animal built up by two rows of small plates rigidly attached to each other by their edges and interlocking down the centre of the ambulacrum in a zig-zag line. Each plate is pierced by two small holes which are connected with the tube-feet, freely movable structures with a sucker on their outer end. Between the inner rows of pores there is an area within which great changes take place with time. In the earliest forms this interporiferous area is smooth and the whole ambulacrum forms a deep rounded valley. In the next higher zone the interporiferous area is divided up by fine incised lines along the margin of the plates and its surface is no longer quite smooth but bears a very faint granulation. In later zones the depth of the incisions between the plates increases and their inner ends become somewhat raised, the granulation is more pronounced and the whole ambulacrum, although still a deep groove, is no longer smoothly rounded. In the next stage the inner ends of the plates are so thickened as to form a V-shaped groove running continuously down the mid-line of the area. Finally the ambulacrum comes to form only a very slight depression with a deep gutter along the mid-line of the narrow interporiferous area, and the surface of each plate above and between the pores is covered with a dense granulation. These changes take place steadily with time, but all individuals living at any one period were not in the same stage of evolution. For example, the smooth type of area is found only in the two upper zones of the Middle Chalk and in the lower zone of the Upper Chalk, but whereas it is the only form found in the Middle Chalk, it occurs in 20% of *Micrasters* from the Upper Chalk zone. The next type in which the plates are marked out by incised lines occurs very rarely in the top zone of the Middle Chalk, and in 44% of *Micrasters* from the lowest zone of the Upper Chalk. In this zone 30% of the specimens are of the type in which the inner ends of the plates are thickened whilst in the succeeding zone 50% belong to this stage.

Thus for each character there is a story of an incoming of a definite evolutionary stage in a small percentage of the individuals living at a certain time. As we pass into newer rocks the percentage displaying this stage increases until the vast majority of all the specimens found conform to it, and we then have living a few individuals in an evolutionary stage which was dominant at an earlier period, and a few precocious specimens which have a structure which will later become the common form of the majority. In the case of *Micraster* the change in structure is perfectly gradual, every conceivable intermediate between the two extremes occurring in one specimen or another. Thus on the evidence of one character alone it is possible to say that a given *Micraster* must have been found in one of three zones and that there is a probability, which could be expressed as a percentage, that it was from the middle of the three zones. It is the belief of all those who have studied the distribution of *Micraster* in the field that it is possible to determine their horizon with much greater accuracy by examining not only one but all of the characters which Dr. Rowe has shown to change in a similar manner. This possibility depends on the fact that an individual *Micraster* which exhibits a slower evolution than usual of one character, will present an acceleration of development for other characters, and that regarded as a whole it will be equivalent in stage, though not identical in structure, with those that are found with it. One character, the ratio of breadth to length of the whole test, does not exhibit a parallel evolutionary change; broad and narrow forms are present in each zone in about the same proportions, so that it is clear that this character is not undergoing a steady evolution. The broad and narrow forms at any one time exhibit a similar range of variation with respect to any one character, and it is perhaps reasonable to assume that the broad forms are descendants of one another and are not mere varieties of the associated narrow species. That this is indeed so is indicated by the fact that in the stage of evolution of their ambulacra they always lag behind the narrow forms.

The general features of the evolution of *Micraster* as set out above are repeated in the evolution of all other series of animals which are well-known. In each case change of structure of any organ or character proceeds in a definite direction and appears to change gradually and not by definite steps. In every case an advanced structure is first met with in a small proportion of the individuals living at a definite time and this proportion grows larger and larger as we proceed upwards. Finally most individuals possess it but a few retain a more primitive structure, whilst the

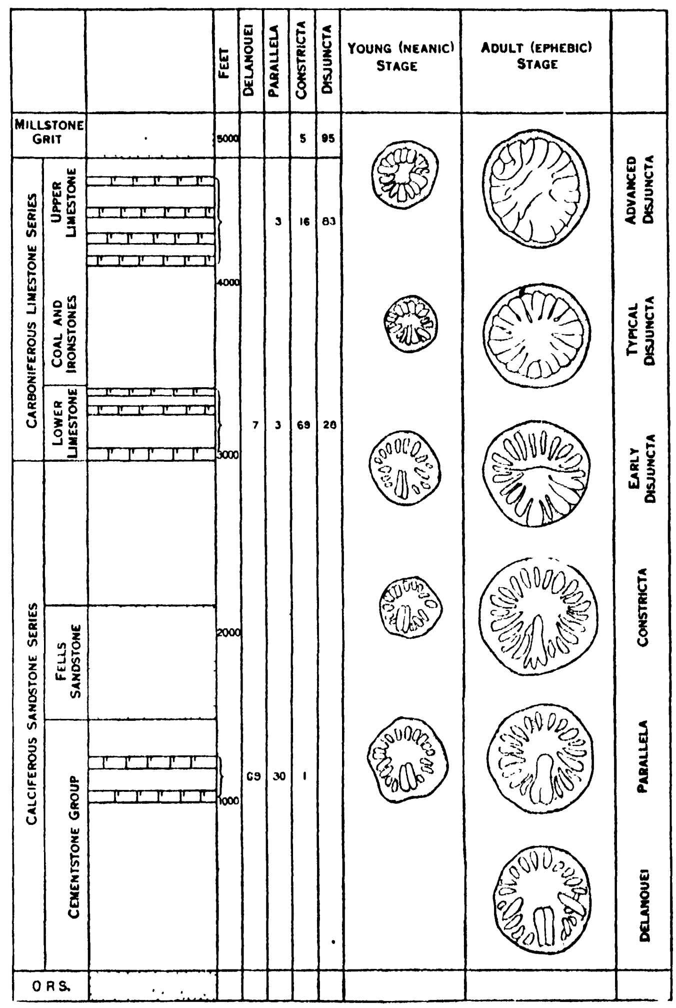
rest are more advanced foretelling the character of the majority in a succeeding period. An animal may be regarded as built up from many quasi-independent characters each exhibiting its own series of evolutionary changes; and characters of any one individual will be found to differ in the evolutionary stage which they have reached, so that by striking an average of the evolutionary stages of all the characters, it is possible to determine the date of the individual with considerable accuracy.

Members of closely allied but distinct groups such as those represented by the broad and the narrow *Micrasters*, undergo a parallel evolution, but the rate of evolutionary change may differ when one group is compared with another. A great part of modern palaeontological work consists in the attempt to sort out the members of such closely allied groups from one another and the establishment of series of forms known as phyla or lineages, which at any one time contain only a single species. This process has perhaps been carried farthest in the case of certain Cretaceous Bryozoa where W. D. Lang has distinguished a very large number of lineages each of which exhibits an evolution parallel to, though differing in detail from, that of the others. The study of lineages presents many difficulties because in the case of animals with a simple skeleton there are not many structures which, persisting unchanged throughout the history of the lineage, enable us to distinguish it from all others. Under these circumstances it is always possible to regard the members of the presumptive lineages as mere varieties which have arisen at each period from a main stock in which the whole of the evolution is taking place. Modern work on genetics has shown that identical mutants are constantly arising from normal animals and that the mutants of allied species and even genera take the same forms. This evidence lends support to the view that the alternative explanation may in many cases be preferable to the accepted distribution of allied forms amongst lineages.

Ammonites.—The ammonites, extraordinarily varied in structure, rapidly changing and very abundant as individuals, were regarded by many palaeontologists as ideal material for the investigation of phylogenies. They have been broken up into an enormous number of genera and species which have been arranged in phylogenetic lines with the aid of Haekel's biogenetic law and the additions made to that hypothesis by Alpheus Hyatt. According to this law an animal during its individual life passes through a series of stages which reproduce its ancestors. This parallel between ontogeny and phylogeny, between individual development and evolution, is not now accepted by most embryologists in its crude form. It implies that evolutionary changes in structure are added at the end of an individual's life, and that they become apparent at earlier and earlier stages in the life-history of its descendants. But we know many cases in which new characters first appear early in the life-history and may be lost when the animal grows older; under these circumstances there can be no recapitulation of phylogeny by ontogeny. An ammonite as it grew older added new material to the margin of its shell without, in most cases, interfering with the previously formed portions. Thus the shell of an adult ammonite preserves in the inner whorls of its coil the chamber of the shell which it occupied at every stage of its life-history.

Application of the biogenetic law to the stages so preserved should allow of the construction of a phylogeny which can then be compared with ammonites found in earlier beds. It is claimed that by this process the phylogeny of many ammonites can be made out, and that recapitulation can be observed in the general shape of the shell, the suture-line and the ornamentation, a true phylogeny requiring that the evidence from the development of these three independent characters shall be consistent. Furthermore it is claimed that certain types of ornament succeed one another in a definite order in all ammonites, the shell of a member of a lineage in the middle of its course beginning smooth, then developing striae, then definite ribs, which become tuberculate, then spiny, and finally repeats this series of stages in the opposite direction, or becomes smooth almost at once. In later forms ribbed and spiny stages appear earlier in the life-history until finally all of them may be skipped, the animal being smooth throughout its life. This type of evolution, which was investigated extensively by C. E. Beecher, has been supposed to occur not only in ammonites but also in gastropods, lamellibranchs and brachiopods, in all of which groups the shell preserves its early growth-stages. It has also been recognised in the development of a colony amongst coelenterates and Bryozoa.

Zaphrentis.—Out of this vast mass it is difficult to select a single case which can be regarded as conclusively established, perhaps the best are those of the development and evolution of the simple coral *Zaphrentis delanouei,* from the Lower Carboniferous of Scotland. Here we have a series of forms occurring throughout a thick series of rocks which were collected on four main horizons. It is clear that the forms from the lowest horizon ascend into those at the top by gradual change, so that no definite dividing lines could be drawn within the series. If the evolutionary series be arbitrarily divided into four stages then it is found that at the lowest horizon 69% of the specimens collected



AFTER CARRUTHER, "EVOLUTION OF ZAPHRENTIS DELANOUEI"

FIG. 1.—CHART ILLUSTRATING THE EVOLUTION OF THE SIMPLE CORAL (ZAPHRENTIS DELANOUEI)

Left three columns show the geological horizon; middle four columns, the percentage of each form of the coral at a definite horizon; and right two columns are drawings of transverse sections of a coral, when young and adult

belonged to the most primitive stage, 30% to the second, and 1% to the third evolutionary stage. At the next horizon, 2,000 feet higher, less than 1% belong to the first, 3% to the second, 69% to the third, and 28% to the fourth stage. At a still higher horizon the first stage is absent altogether. The second stage is represented by less than 1%, the third by 16% and the fourth and last by 83%. In the highest horizon studied this stage is attained by 95% of all the individuals. We have here an exact parallel to the evolution of a character in *Micraster.* But if we examine the development during life of an individual coral from one of the later horizons, we find a very complete parallel between the

evolutionary series established on quite other evidence and the individual ontogeny.

It appears that the biogenetic law, though a useful tool, must be used with caution in the construction of phylogenies, and that genealogical trees made by its aid must not be used as evidence in favour of the hypothesis itself.

Vertebrates.—The general character of the phylogenies of invertebrates which have been made by palaeontologists is repeated in the vertebrate genealogies, which rest on far more elaborate evidence. The best case is that of the horse. (*See* EQUIDAE, HORSE.) The equally complete stories of the camels, dogs and titanotheres have not yet been completely published and cannot be intelligently summarised. The rhinoceroses, as shown by the work of H. F. Osborn, have a very complex history, many different lineages arising in the Oligocene, and passing up into later geological periods. In all cases the individuals increase in size, and in many the descendants of hornless forms, long after their separation, independently develop horns which though varying in number and position in the different lineages are always of the characteristic rhinoceros pattern. The separate appearance of these horns is an example of a phenomenon abundantly seen amongst fossils. It implies that the mechanism present in the fertilised egg which determines what the structure of an adult animal will become, is such that it is capable of modification only in certain definite ways, and that in rhinoceroses this mechanism is of such a nature that when a horn arises it will be of a characteristic type, quite different from the analogous structures of giraffes, deer, oxen and titanotheres.

In certain cases the same phenomenon is presented in a somewhat different form. The whole structure of some part of an animal may exhibit a slow and gradual change in character going on throughout the whole of its history, and this change may be unaffected by modifications of the animal's habits. One of the best examples is to be found amongst the labyrinthodont Amphibia. Here all the Carboniferous forms are round-bodied, have the roof of the mouth completely supported by bone and are aquatic. Their immediate descendants are terrestrial and the head is a little flattened, while vacuities appear between the bones in the palate. In still later forms the head and whole body are extremely flat and the palatal vacuities have become enormous. These creatures must have been entirely aquatic; thus in them we have a persistence of direction of structural change so regular that the geological age of any specimen can be recognised with considerable accuracy, whilst the animal's habits change twice in different directions. Furthermore it can be shown that the evolutionary structural changes pursue the same course in different families of labyrinthodonts and in two other orders of Amphibia not closely related to them.

Thus it appears that evolutionary change in animals may be either directed towards an improvement in structure which adapts the animal for some particular mode of life, or it may take place without any apparent relationship to habits. Evolutionary change which is not adaptive in nature may be expected to take the same course in related lineages, and adaptive changes will be similar in such of their members as have the same habits and are subjected to the influence of like environments. (Further examples of this phenomenon will be found in the articles HORSE; PERISSODACTYLA; MAMMALIA; and REPTILES.)

Adaptive Radiation.—Another phenomenon first emphasised by H. F. Osborn, is that which is known as "adaptive radiation." The early members of any group, the Basal Eocene placental mammals for example, are small, and on the whole very uniform in structure; as time goes on their descendants radiate so as to fill all habitats open to them. Thus the mammals are fitted for life in forests, plains, deserts and mountains, for flight or for an aquatic life in rivers, along the sea coast or in the open oceans. They may eat animals or plants, the prey may be small or large, and it can be caught either by chase or by stalking. They may live in the Arctic or in the tropics. In consonance with these varied habits the structure of mammals has become exceedingly diverse. The limbs may be long, freely moveable and with grasping hands and feet; as in arboreal animals such as lemurs. They may become reduced to flippers in the whales; the digits may end in hoofs among cursorial animals, or may be clawed in carnivorous ones. The dentition may be fitted for gnawing, for cropping grass or for tearing flesh from bones, and it is usually possible to determine from its character what were the habits of the animal.

The "adaptive radiation" of all the higher groups of vertebrates follows similar lines. Reptiles during Mesozoic times filled the places now occupied by mammals and sometimes present striking similarities to them in general appearance.

A survey of the evolutionary history of animals as a whole shows that for each group there is a certain period at which the beginnings of an adaptive radiation appear and within a very short time lead to the establishment of the great majority of the families of which it is composed. Thus the ammonoids, although they had been in existence since Devonian times, are represented only by two families in the Carboniferous. In the Permian and Trias they branch out into most diverse forms, clearly fitted for very different modes of life. Teleost fishes existing from Upper Triassic times are represented only by a single family in the Lower Cretaceous. By the Upper Cretaceous nearly a dozen families have appeared and by Eocene times the majority of those which are known were in existence. Reptiles, beginning in the Carboniferous, experienced a wide radiation in Permian times, whilst the "radiations" of birds and mammals lie in the Tertiary, and were already fully established at the end of the Eocene. Thus in all these cases the initiation of the main types took place together and led very rapidly to the establishment of separate families, which then undergo a steady evolution without bringing about fundamental alterations in their structure. This fact implies that only at its origin and from forms of conservative structure can a group give rise to new lines whose members differ from their ancestors in fundamental features. In other words the possibility of change becomes more and more restricted the further the members of a group have carried a process of adaptive radiation. Nevertheless certain of the smaller groups of all classes may exhibit an adaptive radiation of their own long after the main development of the class is completed.

Migration.—The fact that the evolution of non-adaptive features pursues a parallel course in related lineages, and proceeds little interfered with by modifications of the environment, at a rate which does not vary widely, provides us with a means of determining approximately the age of rocks which may not contain known or even fully identifiable fossils. For example any rocks anywhere in the world which contain members of the highest grade of labyrinthodonts, will be of Triassic age and even from previously unknown forms it may be possible to determine whether they belong to the upper or lower part of that system.

The use of individual species of fossils to determine the identity of horizons in widely separated parts of the world suffers from a theoretical objection which was pointed out by T. H. Huxley, who suggested that an individual animal probably came into existence at some definite place and that in order to reach any other locality its individuals had to migrate. Nothing was known of the time taken in such migrations but it was conceivable that it might be comparable with such small divisions of geological time as those represented by zones. He stated that rocks containing identical faunas were homotaxial but not necessarily contemporaneous. We now know chiefly from the evidence of fossil mammals that all the larger groups have an evolutionary home where the important part of their evolutionary change takes place, and that from this centre there is a constant migration in all directions of such a nature that the series of forms in some neighbouring area, although they fall into a morphological family tree, are not in fact directly descended from one another. Thus all evidence shows that the main evolution of the horses took place in northern Asia and that the series which is found throughout Tertiary times in North America is really built up from the members of many overlapping migrations, each new colonist giving rise to a short evolutionary series of its own. On the other hand the camels arose in North America and the forms there found build up a true phylogenetic series.

The migrations of mammals are now well understood and an

account of them will be found in the article ZOOLOGICAL REGIONS. The time taken in migration must vary enormously for different groups and only one case in which it can be determined has been described. W. D. Matthew has pointed out that when at the end of Meiocene times, North and South America became connected, northern animals, horses and mastodons, migrated into South America, and southern forms, such as the giant ground-sloths and glyptodonts, moved into the United States. It is then possible by comparing Pleistocene North and South American faunas, to show that during the period of their migration these animals underwent little if any evolutionary change, and that in South America Pliocene forms of horses and elephants are associated with Pleistocene ground-sloths, whilst in North America ground-sloths of Pliocene type are found with Pleistocene elephants. The implication is that the migration took a period comparable in length with the interval between the Upper Pliocene and the Lower Pleistocene. If it should prove to be generally true that whilst migrating an animal exhibits little evolutionary change it should follow that at any time the members of a group at its home will be more advanced than those at the periphery of the area of distribution. This conclusion seems to be justified by the condition of affairs at the present day.

Morphological Problems.—Of recent years a new use of palaeontology has arisen. Information derived from fossil material has been applied by Robert Broom and those who have followed him, to the solution of morphological problems which have been stated by students of comparative anatomy and of embryology. In some ways one of the best examples is the proof from the mammal-like reptiles, of the truth of Reichert's theory of the derivation of the mammalian ear-ossicles. (*See* REPTILIA.) The most striking case, however, is that which arises from the work of E. A. Stensio on *Cephalaspis*. In this animal, Stensio has been able to show that complete cranial nerves associated with gill-pouches exist in the orbital region, and that the mouth is a small hole lying quite anteriorly in front of the profundus nerve. It had long ago been concluded by students of embryology that the ancestral vertebrates must have possessed these characters but the evidence on which they had relied was inconclusive and its validity had been denied by competent workers. Now in the light of Stensio's work it is quite clear that the original interpretation of the embryological data was sound. (*See* CYCLOSTOMATA.)

The study of fossils is thus seen to be of great practical utility to geologists and is capable of affording information about the course of evolution which can be obtained in no other way. Its evidence is clear that evolution provides an adequate account of past and present faunas and the facts with which it deals serve as a control of evolutionary theory. Palaeontology forms the base of a rational zoo-geography and it is capable of giving invaluable assistance in the solution of many morphological problems.

PALAEOSPONDYLUS, a small fish-like vertebrate fossil found in the Old Red Sandstone of Caithness, now referred to the Cyclostomata (*q.v.*).

PALAEOTHERIUM, a genus of primitive perissodactyls of the Upper Eocene and Lower Oligocene of Europe. The genus really includes many species, ranging in size from that of a rhinoceros down to that of a pig, and is typical of a considerable group of primitive perissodactyls nearly related to the Eocene ancestors of the horse but currently distinguished as a separate family. They are limited to the later Eocene and early Oligocene of Europe, and have not been found in Asia or North America.

The Palaeotheres have three toes on each foot, but the side toes are not so much reduced as in the earlier three-toed horses. The teeth are short-crowned without cement, the upper teeth with a pattern of two outer crescents and two transverse crests which are usually more oblique than in the early Equidae. The premolars are fully molariform as in the post-Eocene Equidae. The nasals in *Palaeotherium* are somewhat retracted, implying the possession of a short proboscis. (W. D. M.)

PALAEOZOIC ERA, in geology, term applied to the oldest strata in the earth's crust from which definite organic remains have been recorded; the base is commonly defined by an unconformity of considerable magnitude, above which occur strata containing OLENELLUS (*sensu lato*), and the fossil evidence suggests that the break varies in intensity in different parts of the world. The upper limit is harder to define, it is usually said to be taken at the top of the Permian but with increased knowledge it has in many places become increasingly difficult to separate this formation from the Trias, the basal formation of the Mesozoic, and it seems likely that it has not always been drawn at the same horizon. The Palaeozoic is divided into several periods, the Cambrian, Ordovician, Silurian (Gotlandian), Devonian or Old Red Sandstone, Carboniferous (Mississippian plus Pennsylvanian) and Permian (*qq.v.*). (G. L. E.)

PALAEPHATUS, the author of a small extant treatise, entitled Περὶ Ἀπίστων ("On Incredible Things"). It consists of a series of rationalizing explanations of Greek legends, without any attempt at arrangement or plan, and is probably an epitome, composed in the Byzantine age, of some larger work.

See edition by N. Festa, in *Mythographi graeci* (1902), in the Teubner series, with valuable prolegomena supplementary to *Intorno all' opuscolo di Palefato de incredibilibus* (1890), by the same writer.

PALAESTRA, the name apparently applied by the Greeks to two kinds of places used for gymnastic and athletic exercises. In the one case it seems confined to the places where boys and youths received a general gymnastic training, in the other to a part of a gymnasium where the *athletae*, the competitors in the public games, were trained in wrestling (παλαίειν, to wrestle) and boxing. The boys' *palaestrae* were private institutions and generally bore the name of the manager or of the founder; thus at Athens there was a *palaestra* of Taureas (Plato, *Charmides*). The Romans used the terms *gymnasium* and *palaestra* indiscriminately for any place where gymnastic exercises were carried on.

PALAFOX DE MENDOZA, JUAN DE (1600–1659), Spanish bishop, was born in Aragon. He was appointed in 1639 bishop of Angelopolis (Pueblo de los Angeles) in Mexico, and there sought to protect the natives from Spanish cruelty, forbidding any methods of conversion other than persuasion. In this he met with the uncompromising hostility of the Jesuits, whom in 1647 he laid under an interdict. He twice, in 1647 and 1649, laid a formal complaint against them at Rome. All he could obtain was a brief from Innocent X. (May 14, 1648), commanding the Jesuits to respect the episcopal jurisdiction. In 1653 the Jesuits succeeded in securing his translation to the little see of Osma in Old Castile. In 1694 Charles II. of Spain petitioned for his canonization; but this was defeated by the Jesuits.

See Antonio Gonzalez de Resende, *Vie de Palafox* (French trans., Paris, 1690).

PALAFOX Y MELZI, JOSÉ DE (1780–1847), duke of Saragossa. Brought up at the Spanish court, he accompanied Ferdinand to Bayonne in 1808 as a sub-lieutenant.. After a vain attempt to secure the king's escape, he fled to Spain. Proclaimed by the populace governor of Saragossa and captain-general of Aragon (May 25, 1808), he declared war against the French, who had already overrun Catalonia and Navarre. He defended Saragossa for a period of 61 days Palafox then attempted a campaign in the open country Forced back by Napoleon's army into Saragossa, he sustained a second siege lasting three months. Palafox himself was captured and imprisoned at Vincennes until Dec. 1813. From 1820–23 he commanded the royal guard of King Ferdinand. He took the side of the Constitution in the civil troubles and was stripped of his honours and offices by the king. Queen Maria Cristina created him duke of Saragossa and from 1836 he took part in military and political affairs as captain-general of Aragon and a senator He died in Madrid, Feb 15, 1847.

See P. de Madrago's biographical notice in the Span. trans. of Thiers, *Hist. des consulates de l'empire*, C W C Oman, *Peninsular War* (Oxford, 1902), vol. i, J Ibáñez Marín, *El defensor de Zaragoza* in *Ateneo*, v. (1908), pp. 81–89.

PALAMAS, GREGORIUS (*c* 1296–1359), Greek mystic and chief apologist of the Hesychasts (*q v.*), belonged to a distinguished Anatolian family, and his father held an important position at Constantinople Palamas at an early age retired to Mt. Athos, where he became acquainted with the mystical theories of the Hesychasts In 1326 he went to Skētē near Beroea, where he spent some years in isolation in a cell specially built for him. His health having broken down, he returned to Mt. Athos, but, finding little relief, removed to Thessalonica About this time Barlaam, the Calabrian monk, began his attacks upon the monks of Athos. Palamas championed their cause in two synods (1341 and 1351) at Constantinople, which definitively secured the victory of the Palamites. During the civil war between John Cantacuzene and the Palaeologi, Palamas was imprisoned After Cantacuzene's victory in 1347, Palamas was released and appointed archbishop of Thessalonica, being refused admittance by the inhabitants, he retired to the island of Lemnos, but subsequently obtained his see

See the historical works of John Cantacuzene and Nicephorus Gregoras, the *Vita Palamae* by Philotheus, and the encomium by Nilus (both patriarchs of Constantinople), also C Krumbacher, *Geschichte der byzantinischen Litteratur* (1897).

PALAMAS, KOSTES (1859–), Greek poet, a native of Patras, studied law at Athens, where he came under the influence of the "popular," as opposed to the "purist" school of Greek After several years of journalism, he published in 1886 his first poetical work, *The Songs of My Country*, followed in 1889 by the *Hymn to Athena*. In 1897 he was appointed secretary to the University of Athens His prose *Essay on Krystallis* (1894) contrasted philosophic with descriptive poets After the publication of *Iambs and Anapaests* and *The Grave* (1898), a series of elegies on his son's death, he became the recognized chief of the "popular" party in literature, whose organ in the press was the review, *Noumas* At that period the "language question" penetrated even politics, leading to the "Gospel Riots" of 1901 and the fall of the cabinet over the translation of the *Oresteia* in 1903 Palamas, who described himself in *The Twelve Lays of the Gipsy* as "the poet of my age and race," was considered by his admirers to be the successor of Solomos, while some critics have found in him the obscurity of Browning Later he produced the poem on Byron, recited at the Byron centenary at Athens in 1924, and *Five Syllables and the Pathetic Whispers* (1925).

See *Poems by Kostes Palamâs*, selected and rendered into English by Th. Ph. Stephanides and G. C. Katsimbalis (1925).

PALAMAU, a district of British India, in the Chota-Nagpur division of Behar and Orissa It consists of the lower spurs of the Chota-Nagpur plateau, sloping north to the valley of the Son. Area 4,916 sq.m.; pop. (1921), 733,394. Nearly three-fourths of the district is uncultivated; 300 sq m. are under forest, and about 3,000 sq.m. are covered with jungle. A small coalfield near Daltonganj was opened in 1902 Deposits of bauxite await development The administrative headquarters are at Daltonganj; pop. (1921), 9,817.

Palamau was under the rule of Chero chiefs till their conquest by the Moguls in 1660. They had their capital at the village of Palamau, where the ruins of two great forts built by them may be seen.

PALAMCOTTAH, a town of British India, in the Tinnevelly district of Madras, on the opposite bank of the Tambraparni river to Tinnevelly town, with which it shares a station on the South Indian railway, 444 m south of Madras Pop (1921), 46,643 It is the administrative headquarters of the district.

PALAMEDES, in Greek legend, son of Nauplius, king of Euboea, one of the heroes of the Trojan War, belonging to the post-Homeric cycle of legends During the siege of Troy, Agamemnon, Diomedes and Odysseus (who had been detected by Palamedes in an attempt to escape going to Troy by shamming madness) caused a letter containing money and purporting to come from Priam to be concealed in his tent They then accused Palamedes of treasonable correspondence with the enemy, and he was ordered to be stoned to death His father exacted vengeance from the Greeks on their way home, by placing false lights on the promontory of Caphareus. The story of Palamedes was first handled in the *Cypria*, afterwards by the tragedians Palamedes was regarded as the inventor of some letters of the alphabet, lighthouses, weights and measures, several games, etc.

See Roscher's *Lexikon*, art "Palamedes"

PALANPUR, a native state of India, in the Gujarat division of Bombay, on the southern border of Rajputana. Area, 1,766 sq m, pop. (1921) 236,694 The town of Palanpur is a railway junction for Deesa, 18 m distant Pop. (1921), 17,843.

Palanpur also gives its name to a political agency, or collection of native states, of which Radhanpur is the most important; total area, 6,393 sq m; pop (1921) 518,566.

PALATE, the roof of the mouth in man and vertebrate animals It consists of the anterior bony "hard palate" (*see* MOUTH), and the posterior fleshy "soft palate" (*see* PHARYNX) For the malformation consisting of a longitudinal fissure in the roof of the mouth, *see* CLEFT PALATE.

PALATINATE (Ger. *Pfalz*), a name given generally to any district formerly ruled by a count palatine, but particularly to a district of Germany, a province of the Republic of Bavaria, lying west of the Rhine (*See* BAVARIA) Excluding the Saar district, which is temporarily under the administration of the League of Nations, the Palatinate has an area of 2,124 sq m, and a population of 931,755 (1925), showing a density of 438 6 to the sq m. It is bounded on the east by the Rhine which separates it from Baden, on the south is the French department of Bas-Rhin, on the west the Saar Territory and parts of the Prussian Rhine Province and on the north Hessen

The rivers in this fertile tract of country are the Rhine, Lauter, Queich, Speirbach, Glan and Blies The Vosges, and their continuation, the Hardt, run through the land from south to north and divide it into the fertile and mild plain of the Rhine, together with the slope of the Hardt range, on the east, and the rather inclement district on the west, which, running between the Saarbruck Carboniferous mountains and the northern spurs of the Hardt range, ends in a porphyrous cluster of hills, the highest point of which is the Donnersberg (2,254 ft). The country on the east side and on the slopes of the Hardt yields a number of the most varied products, such as wine, fruit, corn, vegetables, flax and tobacco The mines yield iron, coal, quicksilver and salt. The industries are very active, especially in iron, machinery, paper, chemicals, shoes, woollen goods, beer, leather and tobacco. Spires (Speyer) is the seat of government, and among the chief industrial centres are Ludwigshafen on the Rhine, which is the principal river port, Landau, and Neustadt, the seat of the wine trade.

See *Mitteilungen des Hist. Ver. der Pfalz* (48 vols. 1870–1927).

History.—The count palatine of the Rhine was a royal official who is first mentioned in the middle of the 10th century. The first count palatine was Hermann I., who ruled from 945 until 996, and although the office was not hereditary it appears to have been held mainly by his descendants until the death of

Count Hermann III. in 1155. In 1155 the German king, Frederick I., appointed his step-brother Conrad as count palatine. In 1214, on the death of the reigning count, the Palatinate was given by the German king Frederick II. to Otto, the infant son of Louis I., duke of Bavaria. The Palatinate was ruled by Louis of Bavaria on behalf of his son until 1228, when it passed to Otto who ruled until his death in 1253.

When the possessions of the house of Wittelsbach were divided in 1255 and the branches of Bavaria and the Palatinate were founded, a dispute arose over the exercise of the electoral vote, and the question was not settled until in 1356 the Golden Bull bestowed the privilege upon the count palatine of the Rhine, who exercised it until 1623. The Palatinate was divided into four parts among the sons of the German king Rupert in 1410, but in 1559, on the extinction of the senior line, Frederick, count palatine of Simmern, succeeded to the Palatinate, becoming the elector Frederick III. Under Charles Theodore, who succeeded in 1742, with the exception of one or two small pieces the whole of the Palatinate was united under one ruler. In 1777 on the extinction of the other branch of the house of Wittelsbach, he became elector of Bavaria. The Palatinate was henceforward united with Bavaria, and has shared its political history from that time.

PALATINE. In the later Roman empire certain officials attending on the emperor, or discharging duties at his court, were called *palatini;* from the time of Constantine the Great the term was also applied to the soldiers stationed in or around the capital to distinguish them from those stationed on the frontier of the empire. In the East Roman empire the word was used to designate the administrators of the finances and the imperial lands.

This use of the word palatine was adopted by the Frankish kings of the Merovingian dynasty. They employed a high official, the *comes palatinus,* who at first assisted the king in his judicial duties and at a later date discharged many of these himself. Other counts palatine were employed on military and administrative work, and the system was maintained by the Carolingian sovereigns. The word paladin, used to describe the followers of Charlemagne, is a variant of palatine. Instead of remaining near the person of the king, some of the counts palatine were sent to various parts of his empire as judges and governors. Being in a special sense the representatives of the sovereign they were entrusted with more extended power than the ordinary counts. From this usage there naturally arose the employment of the word to denote the districts over which these powers were exercised. By Henry the Fowler, and especially by Otto the Great, counts palatine were sent into all parts of the country to support the royal authority by checking the independent tendencies of the great tribal dukes. We hear of a count palatine in Saxony, and of others in Lorraine, in Bavaria and in Swabia, their duties being to administer the royal estates in these duchies. The count palatine in Bavaria became duke of this land, the lower title being then merged in the higher one; and with one other exception the German counts palatine soon became insignificant, although, the office having become hereditary, Pfalzgrafen were in existence until the dissolution of the Holy Roman empire in 1806. The exception was the count palatine of the Rhine, who became one of the four lay electors and the most important lay official of the empire. In the empire the word count palatine was also used to designate the officials who assisted the emperor to exercise the rights which were reserved for his personal consideration. They were called *comites palatini caesarii,* or *comites sacri palatii;* in German, *Hofpfalzgrafen.*

From Germany the term passed into England and Scotland, into Hungary and Poland. In England palatine was an artificial word, applied to counties which stood outside the ordinary course of administration. In Hungary the important office of palatine owes its inception to St. Stephen. At first the head of the judicial system, the palatine became after the king the most important person in the realm. Under the later Habsburg rulers of Hungary the office was several times held by a member of this family, one of the palatines being the archduke Joseph. The office was abolished after the revolution of 1848. In Poland the governors of the provinces of the kingdom were called palatines, and the provinces were sometimes called palatinates.

In America certain districts colonized by English settlers were treated as palatine provinces. In 1632 Cecilius Calvert, 2nd Lord Baltimore, received a charter from Charles I. giving him palatine rights in Maryland. In 1639 Sir Ferdinando Gorges, the lord of Maine, obtained one granting him as large and ample prerogatives as were enjoyed by the bishop of Durham. Carolina was another instance of a palatine province.

See C. Pfaff, *Geschichte des Pfalzgrafenamtes* (Halle, 1847); G. T. Lapsley, *The County Palatine of Durham* (1900); R. Schröder, *Lehrbuch der deutschen Rechtsgeschichte* (Leipzig, 1902).

PALATKA, a city of north-eastern Florida, U.S.A., the county seat of Putnam county; on the beautiful St. John's river, 50 m. S. of Jacksonville. It is served by the Atlantic Coast Line, the Florida East Coast and the Southern Railways, and river steamers. Pop. 7,208 in 1925 (State census), of whom 3,661 were negroes; estimated locally at 10,000 in 1928. The city is a shipping point for citrus fruit and vegetables, and has large cypress lumber-mills, foundries and machine shops, turpentine stills, and other industries. Palatka was incorporated as a town in 1853, as a city in 1872. It has a commission-manager form of government.

PALAUNG, a Burmese term for a group of non-Shan tribes living in the Shan States and speaking dialects of the same Mon-Khmer language so variant that Shan is used as a *lingua franca.* The Palaung is darker than the Shan in complexion; of a timid and peaceable disposition; Buddhist and *Nat*-worshipper by religion; a cultivator of paddy and of tea for pickling. Tattooing is practised, and divining by chicken-bones. Marriage is regulated by consanguinity and the formalities entail a sort of theft of the bride, or secret elopement, and subsequent money payments to her relatives. The ordinary dead are buried with a coin for ferry-dues in the mouth or on the chest, but the corpses of priests are dried in the coffin and kept up to a year. Headmen (*kin*) are sometimes treated similarly, but the corpse is not kept so long. After cremation the bones are placed on the ground in an open pot.

See Cameron, *Palaungs of Kodaung* (Rangoon, 1912); Milne, *Home of an Eastern Clan* (1924).

PALAWAN, a small Siamese state on the west coast of the Malay peninsula. Area 900 sq.m.; pop. (latest returns) 20,000. The people are chiefly engaged in the cultivation of pepper, of which about 150 tons are annually exported. (*See* MALAY STATES: *Siamese.*)

PALAZZOLO ACREIDE, a town of Sicily, province of Syracuse, 34 m. by rail W. of it, 2,285 ft. above sea-level. Pop. 14,653 (town), 16,154 (commune). The ancient city of *Acrae,* founded by Syracuse in 664 B.C., lay on the hill above the modern town, the approach to it being defended by quarries, in which tombs of all periods have been discovered. The auditorium of the small theatre is well preserved. Close to it are ruins of other buildings, a small Odeon and some baths.

PALE, used as a historical term, is a district marked off from the surrounding country by a different system of government and law or by definite boundaries. The best known of these districts was the "English pale" in Ireland, dating from the reign of Henry II., although the word "pale" was not used in this connection until the latter part of the 14th century. The pale varied considerably according to the strength or weakness of the English authorities, and in the time of Henry VIII. was bounded by a line drawn from Dundalk to Kells, thence to Naas, and from Naas east to Dalkey, embracing, that is, part of the modern counties of Dublin, Louth, Meath, and Kildare. The pale existed until the complete subjugation of Ireland under Elizabeth; the use of the word is frequent in Tudor times. There was an "English pale" or "Calais pale" in France until 1558, extending from Gravelines to Wissant, and for a time under the Tudors an "English pale" in Scotland.

PALEARIO, AONIO (*c.* 1500–1570), Italian humanist and reformer, was born at Veroli, in the Roman Campagna. Other forms of his name are Antonio Della Paglia, A. Degli Pagliaricci. In 1520 he went to Rome, where he entered the brilliant literary circle of Leo X. When Charles of Bourbon stormed Rome in 1527 Paleario went first to Perugia and then to Siena, where he settled as a teacher. In 1536 his didactic poem in Latin hexa-

meters, *De immortalitate animarum*, was published at Lyons. In 1542 a tract by him, commonly known as *Libellus de morte Christi*, was made by the Inquisition the basis of a charge of heresy, from which, however, he successfully defended himself. In Siena he wrote his *Actio in pontifices romanos et eorum asseclas* (posthumous, Leipzig, 1606), attacking the substitution of traditional for scriptural authority, and certain doctrines, especially that of purgatory. Professor first at Lucca and then at Milan he was denounced by the inquisitor of Milan in 1567, sent to Rome for trial, condemned in Oct. 1569, and executed in July 1570.

An edition of his works (*Ant. Palearii Verulani Opera*), including four books of *Epistolae* and 12 *Orationes* besides the *De immortalitate*, was published at Lyons in 1552; this was followed by others, the fullest being that of Amsterdam, 1696. Lives by J. G. Gurlitt (in German) (Hamburg, 1805); A. Young (2 vols, 1860); J. Bonnet (Paris, 1862, Eng trans 1864). *See* also G. Morpurgo, *Un Umanista martire. Aonio Paleario* (1912).

PALEKHI, a Russian village south-east of Shuya (56° 43′ N., 41° 23′ E.), in the Ivanovo-Voznesensk province, noted for its handicraft work, dating from the time of the ikon painters of Vladimir Suzdal, and famous in the 16th and 17th centuries. In the 19th century the ikon market became limited and the 1917 revolution threatened to destroy the art. The Palekhi artel, however, began to make designs on box covers and other small articles of compressed paper and their work has found a market exceeding the supply in Nizhniy-Novgorod and New York, and has obtained medals at the Vienna and Paris exhibitions

PALEMBANG, a residency of south-east Sumatra, Dutch East Indies, facing the island of Banka, area 85,918 sq kilometres; population (1927), 844,626 It extends from the mountains which flank the west coast of Sumatra and form the dividing line between it and the residency of Bencoolen, to the Straits of Banka, and except for the mountainous country in the extreme south-west, is very flat and intersected by numerous rivers, which flow eastwards to the sea, and with their many and wide mouths form marsh lands about the coast, which has also many sandbanks. The principal of these is the Musi, which has many important tributaries, and on its banks, some 50 miles from the sea, near which it divides into two main channels, is situated Palembang, the capital of the residency, also a port, and the chief commercial town in South Sumatra, population 62,438 (1,117 Europeans and Eurasians), the largest town in Sumatra Apart from the public buildings, barracks, hotels, church, European business offices and residences, and a great mosque, which are built of stone, Palembang is a town of native houses, mostly built on piles, on account of floods, and it stretches along both sides of the river, and its inhabitants, and those of the residency are mostly Malays. The depth and width of the Musi river renders Palembang accessible to large ocean steamers, but they are able to cross the bar at its mouth only at flood tide. The port has wharves on screw piles 250 metres long, and is the terminus of the main line of the railway system of South Sumatra At Plaju, down the river from Palembang, is the petroleum centre in Sumatra of the Royal Dutch Petroleum Company, the oil, raised at Muara Enim, near the hills in the south-west, being carried to Plaju and refined there. Palembang has a considerable trade with eastern ports in the Malay Peninsula, Siam and China, and there is also important traffic by road and river with the hinterland and regular communication with other ports in Sumatra, and with Java. The value of its exports, in 1926, was 89,287,248 gulders and of its imports 41,775,831 gulders. This represented the total produce of the residency, for which Palembang is the only outlet, and the principal items of export were coffee, rubber, copra, cotton, rattans, quinine and coal, from the government-owned Bukit Asim collieries, at Tandjong, not far from Muara Enim. Coffee is the chief crop grown for export, of the *Robusta* variety, and it is a native cultivation, as, also, are rubber and cotton. Rice is the chief food crop. A *Controleur*, also an agricultural adviser, are stationed at Muara Enim, which is connected by rail and by road (with motor-car service), with Palembang, and also by motor road service with Bencoolen on the west coast, passing through Lahat, Tebingtinggi and Muaru Beliti; thus Palembang is linked up by motor with Bencoolen, and, also *via* Muara Enim, with Muaro Duop, in the extreme south, passing through Batu Raja. A road runs north-eastwards from Muaro Duop to Kaju Agung, and one from Batu Raja to Muaru Kuang, which then forks northwards, to join the Muara Enim-Palembang road: a loop of the Muara Enim-Bencoolen road runs southwards to Pagerkalam, on the border, which has a *Controleur*. The southern part of Palembang residency, mainly about the roads mentioned, is in course of development; in the northern half little has been done, communications are primitive, and, apart from Surulangun, in the north-west, Talang Betutu, north of Palembang, and Sekaju, on the Musi, in central Palembang, each of which has a *Controleur*, the nature of the lands about the coast makes extensive settlement impossible

Palembang is one of the places in the Dutch East Indies where Islam made its first appearance Arab colonies in certain Chinese ports, disturbed by Chinese civil war, diverted their commerce to the Dutch East Indies, and Palembang was one of the spots selected for the enterprise. Little, however, is heard about Palembang in history until in 1812 the Sultan, although he had recognized British suzerainty (the British occupation of the Dutch East Indies), massacred many Dutch settlers. Thereupon a British force under Colonel Gillespie was landed which drove him from the capital and installed his brother in his stead, Banka and Billiton were ceded to Great Britain, and it was during the absence of this force in Sumatra that the Sultan of Jokjakarta endeavoured to destroy European power in Java. The cession of Banka and Billiton to the Dutch, in return for Cochin in India, because of a dispute as to whether Billiton was included in the cession, brought Palembang very prominently before Dutch notice, the more so as Sir Stamford Raffles encouraged the Sultan in his attitude of independence, and in 1825 they abolished the Palembang Sultanate and brought the country under their own rule, whilst recognizing certain chiefs. (E. E L)

PALENCIA, an inland province of Spain, one of the eight into which Old Castile was divided in 1833; bounded on the north by Santander, east by Burgos, south by Valladolid, and west by Valladolid and Leon Pop (1920) 191,719; area 3,256 sq m The principal rivers are the Pisuerga and the Carrion, which unite at Dueñas and flow into the Duero at Valladolid The north is traversed by the Cantabrian mountains, the highest summit being the culminating point of the Sierra del Brezo (6,355 ft) The remainder of Palencia, the "Tierra de Campos," belongs to the great Castilian table-land. In the south is a marsh or lake, known as La Laguna de la Nava The mountainous district abounds in minerals, but only coal and small quantities of copper are worked. The province is crossed in the south-east by the trunk railway connecting Madrid with France via Irun, while the line to Santander traverses it throughout from north to south; there are also railways from the city of Palencia to Leon, and across the north from Mataporquera in Santander to La Robla in Leon A branch of the Santander line gives access to the Orbo coal-fields The Canal de Castilla, begun in 1753, and completed in 1832, connects Alar del Rey with Valladolid Wheat and other cereals, vegetables, hemp and flax are extensively grown, and there are manufactures of linen and woollen stuffs, oil, porcelain, leather, paper and rugs Palencia rugs are in great demand throughout Spain The only town with more than 5,000 inhabitants is Palencia (*q v*)

PALENCIA, an episcopal city, and the capital of the Spanish province of Palencia; on the left bank of the river Carrion, on the Canal de Castilla, at the junction of railways from Leon and Santander, and 7 m N. by W. of Venta de Baños on the Madrid-Irun line. Pop. (1920), 19,543. Palencia is built in the midst of the level plains called the Tierra de Campos, 2,690 ft. above sea-level. Palencia, the Pallantia of Strabo and Ptolemy, was the chief town of the Vaccaei. Its history during the Gothic and Moorish periods is obscure; but it was a Castilian town of some importance in the 12th and 13th centuries. The university founded here in 1208 by Alphonso IX. was removed in 1239 to Salamanca. The cathedral was begun in 1321, finished in 1504 and dedicated to St. Antolin; it is a large building in the later and florid Gothic style of Spain. The site was previously occupied by a church erected by Sancho III of Navarre and Castile (1026–

35) over the cave of St. Antolin, which is still shown. The cathedral contains El Greco's San Sebastian and other valuable paintings, old Flemish tapestry, and beautiful carved woodwork and stonework. The hospital of San Lazaro is said to date in part from the time of the Cid (*q.v.*), who here married Ximena in 1074. Manufactures are iron, rugs, alcohol, leather, soap, porcelain, linen, cotton, wool, machinery and matches.

PALENQUE, the modern name of a deserted city in Mexico, in the narrow valley of the Otolum, in the north part of the State of Chiapas, 80 m. S. of the Gulf port of Carmen. About 30 m. away, on the left bank of the Usumacinta river, stand the ruins of Men-ché or Lorillard city. The original name of Palenque has been lost, and its present name is taken from the neighbouring village, Santo Domingo del Palenque. Unlike the dead cities of the Yucatán plains, Palenque is surrounded by wooded hills and overgrown by tropical vegetation.

There is less stone carving on the exterior walls, door jambs and pillars of the buildings than on those of the Yucatán peninsula; this is due to the harder and more uneven character of the limestone. Probably owing to the same cause, there is less cut stone in the walls, the Palenque builders using plaster to obtain smooth surfaces. There is, however, considerable carving on the interior walls, the best specimens being on tablets, affixed to the walls with plaster. Modelling in stucco was extensively used. A few terra-cotta images have been found.

The so-called Great Palace consists of a group of detached buildings, apparently ten in number, standing on two platforms of different elevations. Some of the interior structures and the detached one on the lower southern terrace are in a fair state of preservation. The plan of construction shows three parallel walls enclosing two corridors covered with the peculiar pointed arches or vaults characteristic of Palenque. A square tower rises from a central part of the platform to a height of about 40 ft., divided into a solid masonry base and three storeys connected by interior stairways. The Temple of Inscriptions, one of the largest and best preserved, is distinguished chiefly for its tablets, which contain only hieroglyphics. Sculptured slabs form balustrades to the steps leading up to the temple, and its exterior is ornamented with figures in stucco, the outer faces of the four pillars in front having life-size figures of women with children in their arms. The small Temple of Beau Relief stands on a narrow ledge of rock against the steep slope of the mountain. Its most important feature is a large stucco bas-relief, occupying a central position on the back wall of the sanctuary. It consists of a single figure, seated on a throne, beautifully modelled in form, and in drapery and ornaments, with the face turned to one side and the arms outstretched. The temples on the east side of the Otolum are distinguished by tall narrow vaults, perforated by numerous square openings giving the appearance of coarse lattice work. The Temple of the Sun stands upon a comparatively low pyramidal foundation. The interior consists of the usual pair of vaulted corridors. The sacred tablet on the back wall of the sanctuary is carved in low relief in limestone, and consists of two figures, apparently a priest and his assistant making offerings. There are rows of hieroglyphics on the sides and over the central design. The Temple of the Cross is a larger structure of similar design and construction. The tablet belonging to this temple has excited controversy, because the design contains a representation of a Latin cross. The Temple of the Cerro, called that of the Cross No. 2, because its tablet is very similar to that just mentioned, stands back against the slope of the mountain, and is in great part a ruin. The ruins of Palenque have been partially investigated by a number of explorers, notably by Stephens, Charnay, Maudslay, Holmes and Blom.

See M. H. Saville, ***Bibliographic Notes on Palenque,*** Museum of the American Indian, Heye Foundation (1928).

PALÉOLOGUE, MAURICE GEORGES (1859-), French diplomat and writer, was born in Paris on Jan. 13, 1859. He entered the diplomatic service at an early age and went successively to Tangier, Rome, Germany, the East, Korea and Bulgaria. He became in 1909 deputy-director and in 1911 director of affairs in the Foreign Office. Shortly before the outbreak of the World War he was appointed ambassador to St. Petersburg (Leningrad), and retained this post until the Bolshevist revolution towards the end of 1917. He consolidated the Franco-Russian alliance, and helped to ensure effective military action on the part of Russia during the period of hostilities. In 1920 he was for a few months secretary-general of the Ministry of Foreign Affairs. Paléologue published in 1921–2, under the title of *La Russie des Tsars pendant la grande guerre* (Eng. trans., 3 vols., 1923–5) records of his diplomatic experiences in St. Petersburg. Among his other publications are literary criticisms on Vauvenargues and Alfred de Vigny (1890) and several novels. He was admitted to the French Academy in 1928.

His recent works include: *Le Roman Tragique de l'Empereur Alexandre II.* (1923, Eng. trans. 1926); *Talleyrand, Metternich, Chateaubriand* (1924, Eng. trans. 1926); and *Cavour* (1926).

PALERMO, a city of Sicily (Greek, Πάνορμος; Latin, *Panhormus, Panormus*), capital of a province of the same name, in the kingdom of Italy, and the see of an archbishop. Pop. (1921), town 361,895, commune 393,612. The city stands in the northwest of the island, on a small bay looking east, the coast forming the chord of a semicircle of mountains which hem in the *campagna* of Palermo, called the Conca d'Oro. The most striking point is Monte Pellegrino (from the grotto of Santa Rosalia, a favourite place of pilgrimage) at the north of this semicircle; at the south-east is the promontory of Zaffarano, on which stood Soluntum (*q.v.*).

A neolithic settlement and necropolis were discovered in 1897 at the foot of Monte Pellegrino, on the north-east side. Panormus certainly was Phoenician as far back as history can carry us. As the Greeks colonized the east of the island, the Phoenicians withdrew to the north-west, and concentrated themselves at Panormus, Motye, and Soluntum. Like the other Phoenician colonies in the west, Panormus came under the power of Carthage. After its conquest by Pyrrhus in 276 B.C. the city was soon recovered by Carthage, but in 254 B.C. it was taken by the Romans. (*See* PUNIC WARS.) In the First Punic War, Hamilcar Barcas was encamped for three years on Hiercte (246–243 B.C.) which should be identified, not with Monte Pellegrino, but with the next mountain to the west of it, Monte Castellaccio, south of the bay of Sferracavallo, which agrees far better with the description of Polybius. The Roman camp lay rather more than half a mile to the south, and there was continual fighting between the two forces (Kromayer, *Antike Schlachtfelder* iii. 1, Berlin, Weidmann, 1912 4 *sqq.*). Panormus received the privileges of autonomy and immunity from taxation. A colony was sent here by Augustus, and the place remained of considerable importance, though inferior to Catana. The town was taken by the Vandal Genseric in A.D. 440. It afterwards became a part of the East-Gothic dominion, and was recovered for the empire by Belisarius in 535, till it was taken by the Saracens in 835. Panormus now became the Muslim capital. After the Norman conquest the city remained for a short time in the hands of the dukes of Apulia. But in 1093 half the city was ceded to Count Roger, and in 1122 the rest was ceded to the second Roger. When he took the kingly title in 1130 it became "*Prima sedes, corona regis, et regni caput.*" During the Norman reigns Palermo was the main centre of Sicilian history, especially during the disturbances in the reign of William the Bad (1154–1166). The emperor Henry VI. entered Palermo in 1194, and it was the chief scene of his cruelties. In 1198 his son Frederick, afterwards emperor, was crowned there. It passed under the dominion of Charles of Anjou in 1266, but the famous Vespers of 1282 put an end to the Angevin dominion. From that time Palermo shared in the many changes of the Sicilian kingdom. In 1535 Charles V. landed there on his return from Tunis. The last kings crowned at Palermo were Victor Amadeus of Savoy, in 1713, and Charles III. of Bourbon, in 1735. The loss of Naples by the Bourbons in 1798, and again in 1806, made Palermo once more the seat of a separate Sicilian kingdom. The city rose against Bourbon rule in 1820 and in 1848. In 1860 came the final deliverance, at the hands of Garibaldi.

Site.—The original city was built on a tongue of land between two inlets of the sea. There is no doubt that the present main

street, the Cassaro (Roman *castrum*, Arabic *Kasr*), Via Marmorea or Via Toledo (Via Vittorio Emmanuele), represents the line of the ancient town, with water on each side of it. Another peninsula with one side to the open sea, meeting as it were the main city at right angles, formed in Polybius's time the *Neapolis*, or new town, in Saracen times Khalesa, a name which still survives in that of Calsa. But the two ancient harbours have been dried up; the two peninsulas have met; the long street has been extended to the present coast-line; a small inlet, called the Cala, alone represents the old haven. The old state of things fully explains the name Πάνορμος.

The earliest existing buildings in Palermo date from the time of the Norman kings, whose palaces and churches were built in the Saracenic and Byzantine styles prevalent in the island. The metropolitan church was built by Archbishop Walter of the Mill—an Englishman sent by Henry II. of England as tutor to William II. of Sicily—and consecrated in 1185, on the site of an older basilica (9th century or earlier), which on the Saracen conquest became a mosque, and on the Norman conquest became a church again, first of the Greek and then of the Latin rite. What remains of Walter's building is a rich example of the Christian-Saracen style, disfigured by the addition of a totally unsuitable dome by Ferdinando Fuga in 1781–1801. This church contains the tombs of the emperor Frederick II. and his parents—massive sarcophagi of red porphyry with canopies above them. But far the best example of the style is the chapel of the king's palace (Cappella Palatina), at the west end of the city. This is the work of King Roger (1132–40). The wonderful mosaics, the wooden roof in Arab style, elaborately fretted and painted, and the marble incrustation of the lower part of the walls and the floor are very fine. Other contemporary mosaics with hunting scenes are in a hall in the palace.

Alongside of the churches of this Christian-Saracen type, there is another class which follows the Byzantine type, *e.g.*, the very small church of San Cataldo, and the adjoining church of La Martorana, the work of George of Antioch, King Roger's admiral (1143). This is rich with mosaics, among them the portraits of the king and the founder. Both these and the Cappella Palatina have several small cupolas, as has the church of San Giovanni degli Eremiti, with a bell-tower, and a picturesque cloister.

The series of Christian-Saracen buildings is continued in the country houses of the kings which surround the city, La Favara and Mimnermo, the works of Roger, and the better known Ziza and Cuba, the works severally of William the Bad and William the Good. The Saracenic architecture and Arabic inscriptions of these buildings have often caused them to be taken for works of the ancient amirs; but the inscriptions of themselves prove their date. All these buildings are the genuine work of Sicilian art, the art which had grown up in the island through the presence of the two most civilized races of the age, the Greek and the Saracen. Later in the 12th century the Cistercians brought in a type of church, which, without any great change of mere style, has a very different effect, a high choir taking in some sort the place of the cupola. The greatest example of this is the neighbouring metropolitan church of Monreale (*q.v.*); more closely connected with Palermo is the church of Santo Spirito, outside the city on the south side, the scene of the Vespers.

Domestic and civil buildings from the 12th century to the 15th abound in Palermo, and they present several types of genuine national art. Of palaces the finest is perhaps the massive Palazzo Chiaramonte, now used as the courts of justice, begun in 1307. One of the halls has interesting paintings of 1377–1380 on its wooden ceiling; and in the upper storey of the court is a splendid three-light Gothic window. The later houses employ a very flat arch, the use of which goes on in the Renaissance. S. Maria della Catena may be taken as an example. The most striking point in the city is the central space at the crossing of the main streets, called the Quattro Cantoni, or four corners. Two of the four are formed by the Via Vittorio Emmanuele, but the Via Maqueda, which supplies the other two, was cut through a mass of small streets in Spanish times.

Of the city gates only two remain, the Porta Nuova and the Porta Felice; both are fine examples of the baroque style; the former was erected in 1584 to commemorate the return of Charles V. fifty years earlier, the latter in 1582. There are also numerous baroque churches, many of them adorned with stuccoes by Serpotta. Outside the walls new quarters have sprung up of recent years, especially on the north beyond the Teatro Massimo and the Politeama Garibaldi; the former (begun by G. B. Basile and completed by his son in 1897) is the largest in Italy.

The museum of Palermo is the richest in the island. Among the most important are the objects from prehistoric tombs and the architectural fragments from Selinus, including several metopes with reliefs, which are of great importance as illustrating the development of Greek sculpture. The collection of Greek vases and terra-cottas is also important. The bronzes are few, but include the famous ram from Syracuse. There are also the Casuccini collections of Etruscan sarcophagi, sepulchral urns and pottery. From Palermo itself come Latin inscriptions of the imperial period, and two large coloured mosaics with figures found in the Piazza Vittoria in front of the royal palace, belonging to a large Roman private house, the remains of which are still visible. Of greater local interest are the mediaeval and Renaissance sculptures from Palermo itself, a large picture gallery, and an extensive collection of Sicilian majolica, etc.

The university, founded in 1779, had 1,886 students in 1925–6. There is also an interesting ethnographical museum. The city wears a prosperous and busy appearance. The Marina, or esplanade at the south of the town, affords a fine sea front with a view of the bay; near it are beautiful public gardens. But as a whole, Palermo turns its back on the sea, and makes surprisingly little use of it. Near the city on the south are the oldest church in or near Palermo, S. Giovanni dei Lebbrosi (the Lepers), founded by Roger I. (1072) and the bridge over the forsaken stream of the Oreto, built by the admiral George (1113). On the other side, towards Monte Pellegrino, is the new harbour of Palermo, round which a new quarter has sprung up, including a yard capable of building ships up to 475 ft. in length, and a dry dock for vessels up to 563 ft. The harbour is in process of enlargement and improvement, and a new breakwater is being built in front of the entrance. In 1926 3,602 steamships and 5,113 sailing ships of a total tonnage of 5,911,507 entered and cleared the port, 210,775 passengers and 848,222 tons of merchandise being dealt with.

The plain of Palermo is very fertile, and well watered by springs and streams, of the latter of which the Oreto is the chief. It is planted with orange and lemon groves, the products of which are largely exported, and with many palm-trees, the fruit of which, however, does not attain maturity. It also contains many villas.

PALES, an Italian god or goddess of flocks and shepherds. The festival called Parilia (less correctly Palilia) was celebrated in her honour on April 21. In this festival Pales was invoked; the stalls were cleansed and purified with magico-religious substances, and the herdsmen leaped three times across bonfires of hay and straw (Ovid, *Fasti* iv. 731–805). The Parilia came to be regarded as the birthday celebration of Rome.

See Wissowa, *Rel. u. Kultus d. Römer* p. 199 et seq., and in ***Hermes*** lviii. 369 et seq., Rose, *Prim. Cult. in Italy,* pp. 106–108.

PALESTINE, a territory administered by the British Government under a mandate from the League of Nations, which came officially into operation in 1923. It is bounded on the north by the French sphere of Syria, as settled by the Franco-British convention of 1920, on the west by the Mediterranean, and on the south by Egyptian and Hejaz territory. On the east is Transjordan (*q.v.*) separated from Palestine roughly by the Jordan valley and the Red sea, but included in the British mandate. Palestine stretches through only about 2 degrees of latitude, being roughly 140 m. long and about 23 m. wide in the north and about 80 m. in the south. Its area (excluding Transjordan) is just over 9,000 sq m., being slightly larger than that of Wales. The total population was estimated in 1914 at 689,281; at the official census in 1922 it was 757,182, of whom 590,890 were Muslim, 83,794 Jews, 73,024 Christians, 7,028 Druses, 163 Samaritans, 265 Bahais and the remainder Sikhs, Hindus and Metawilehs. The estimated population (1926) was 852,268. Since

the promulgation of the Immigration Ordinance (1920) there has been a large immigration of Jews.

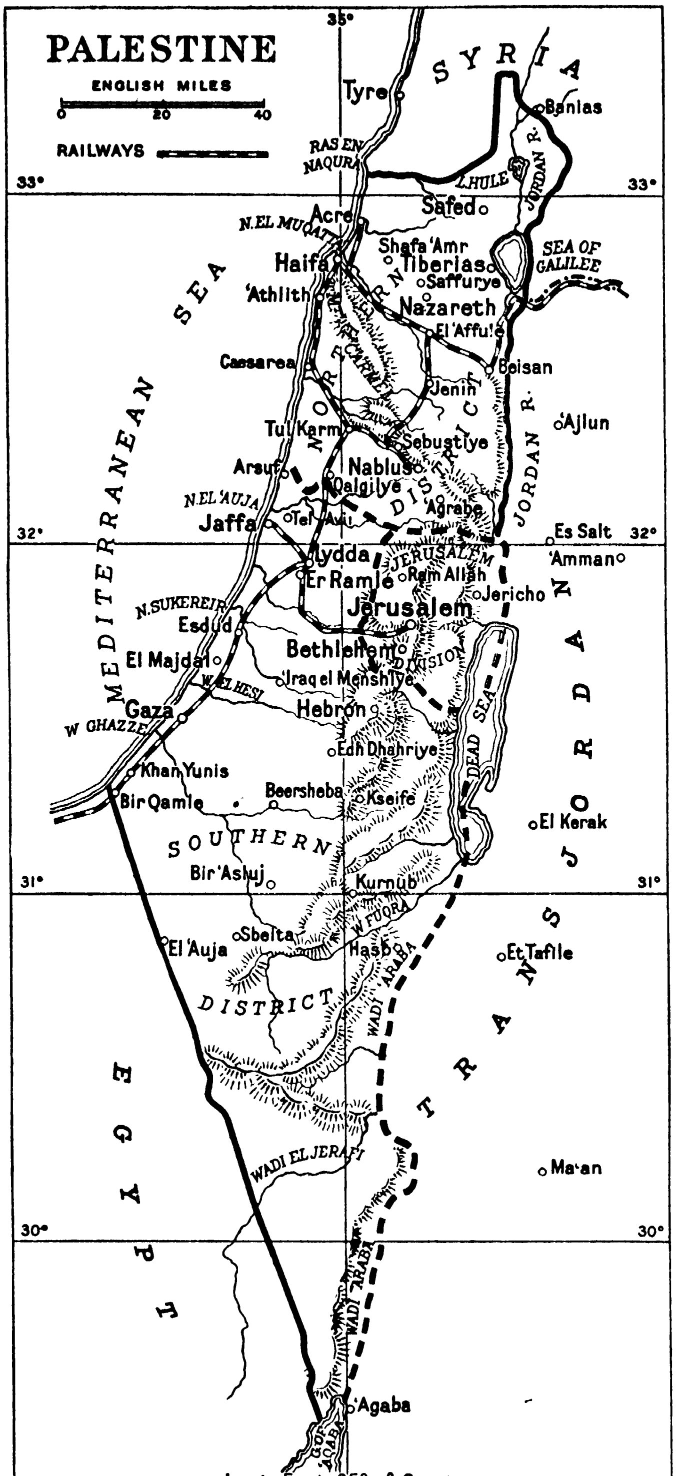
There is no ancient geographical term that covers all the area now known as Palestine. Until the period of the Roman occupation the region was subdivided into independent provinces or kingdoms, different at different times (such as Philistia, Canaan, Judah, Israel, Bashan, etc.), but never united under one collective designation. The extension of the name of Palestine beyond the limits of Philistia proper is not older than the Byzantine period. The country is at present (1929) divided into two districts: Jerusalem—southern, and Haifa—northern.

Physical Features.—Palestine forms part of an ancient plateau rising eastward from a sandy shore to an elevated tableland. A characteristic feature is that it is deeply fractured along certain lines, running from north to south. Secondary fracture lines, trending north-west to south-east, cross the main fractures, and are somewhat replaced east of Jordan by others running almost east and west. The main fractures determine the direction of the coast, with evidences of sunken land north of Carmel and of uplift along the sandy shores to the south. The steady rise of the plateau from the coast eastwards is broken by the greatest fracture line of all: that which forms the Jordan valley and the Dead sea. A belt of land has sunk deeply between a series of parallel north to south fractures, which may be followed both north and south of Palestine. The fracture is continued northwards from the Sea of Galilee between Hermon (9,383 ft.) and Lebanon (6,070 feet). The depression deepens southwards from the Sea of Galilee down to its deepest point in the Dead sea, some 2,600 ft. below the level of the Mediterranean.

Another stretch of lowland, forming the Vale of Esdraelon, passing towards the Jordan valley through the narrower Vale of Jezreel, represents one of the main secondary fracture lines with its general north-west to south-east direction. As a route from early times it has played an important part in the history of the country—at one time the highway of commerce, at another, the highway of war. These secondary fracture lines may be traced south of Esdraelon in the courses of those streams that flow, mostly in the rainy season, from the plateau's edge to the sea. East of Jordan, Arnon and Jabbok and Yarmuk are the main rivers. They tend to follow an east-to-west course, falling into Jordan. The Yarmuk was the northern limit of early Israelite life; to the north lay the Hauran cornfields under the influence of Damascus in the days of its greatness. Between Jabbok and Yarmuk was the land of Gilead that was the refuge of Israel in the days of distress (2 Sam. ii.).

The much fractured plateau of rocks of pre-carboniferous and possibly Archean age is generally concealed by later deposits, but these ancient rocks are exposed along the eastern margin of the Wadi-el-'Araba at the foot of the plateau of Edom. Similar rocks attain a greater extension towards the south, forming nearly the whole of Sinai and the hills of the east side of the Gulf of 'Aqaba. Owing to the extensive faulting in the neighbourhood of Jordan, the western (downthrow) side (forming Palestine) is made up of the newer beds (Upper Cretaceous and later) while east of Jordan the older rocks, sometimes down to the Archean floor, are exposed at the foot of the plateau. The Upper Cretaceous, represented by limestones with bands of chert, covers by far the greater part of the country, capping the plateau lands of Moab and Edom, and forming most of the high land between the Jordan and the Mediterranean. It is overlaid towards the west by similar limestones, which contain nummulites and belong to the Eocene, and are followed near the coast by the calcareous sandstones of Philistia of the same date.

Tertiary basic lavas cover extensive areas in Jalan and Hauran. These rocks are able to retain the rain and, when decomposed, form excellent soils for cereal growing and have been cornlands from early times. Small patches of volcanic material occur in Moab and also west of Jordan, especially near the Sea of Galilee. The drainage system on the plateau is peculiar. Its long and gradually rising western slope carries the main streams that eat back deep channels in the limestone before falling on the western plain. The eastern limit of the plateau falls precipitously



MAP OF PALESTINE SHOWING PLACES ASSOCIATED WITH BIBLICAL HISTORY

into Jordan, and is cut deeply by periodic torrents that rush down its slope. So sharp is this eastern edge that Bethlehem, only 14 m. from the Dead sea, stands 3,842 ft. above its waters and 5,150 ft. above its deepest point.

Palestine divides itself naturally into two longitudinal strips—the maritime plain and the mountain region.

The Maritime Plain, which, with a few interruptions, extends along the Mediterranean coast from Lebanon to Egypt, is a strip of land of remarkable fertility. It is formed of raised beaches and sea-beds, ranging from the Pliocene period downwards, and resting on Upper Eocene sandstone. It varies greatly in width. At the mouth of the Kasimiya it is some 4 m. across, and this breadth it maintains to a short distance south of Tyre,

where it suddenly narrows; until, at Ras el-Abiad, the cliffs reach the coast. South of this promontory the plain begins to widen again, being from 4 to 5 m. broad at Acre (Akka), while further south, at Haifa, it is of still greater width, and opens into the extensive Merj Ibn 'Amir (Plain of Esdraelon) which intersects the whole country. South of Haifa the promontory of Carmel effaces the plain; here the passage along the coast is barely 200 yd. in width. At 'Athlit, 9 m. to the south, it is about 2 m.; from this point it expands uniformly to about 20 m. at Ascalon. From the Kasimiya southwards the maritime plain is crossed by numerous river-beds, with a few exceptions winter torrents only.

The slopes down to the coastal plain grew fruits and corn, and were the centre of agricultural life. Here blossomed the "Roses of Sharon." Israel's hold upon the plain was usually weak, and the south-west was the centre of the Philistine power. Any settlement on this plain was essentially a station along the great route between Egypt and the Hittites, Damascus or Assyria. As the Jewish Prophets foresaw, no power could ever maintain itself in such a position, and although the Philistines at one time had control of the foothills they were driven back by David and Solomon, and in the days of the Maccabees the Philistine power was no longer a distinct unit.

The Mountain Region.—The hill country of Judaea is the nucleus of Palestine. A short distance north-north-east of Bethel stands Tell 'Asur (3,318 ft.), an outpost of the high ground which we shall consider as the Judaean hills. South of it is the long zigzag range known as Jebel el-Kuds, named from Jerusalem (el-Kuds) the chief town built upon it. The highest point is Neby Samwil (Mizpah), 2,935 ft. above the sea, north of Jerusalem. The city itself stands at an altitude of 2,593 feet. To the south of it begins the subdivision of the Judaean hills now known as Jebel el-Khalil, from Hebron (el-Khalil), which stands in an elevated basin some 450 ft. above the altitude of Jerusalem; it is here that the Judaean hills attain their greatest height. South of Hebron the limestone ridge finally breaks up and loses itself in the southern desert.

On the west side of the watershed the mountainous district extends about half-way to the sea, broken by deep valleys and passes. Among these the most important are the Wadi Selman (Valley of Aijalon), which seems to have been the principal route to Jerusalem in ancient times; the Wadi Isma'in, south of this, along which runs a road from Jaffa to Jerusalem; and the Wadi es-Surar, a higher section of the bed of the Nahr Rubin, with its railway line. It was among these hills in early times, cut off from the great trade-routes of the plain, that the shepherds treasured their nomad traditions and preserved the old rites of worship of Jehovah as well as on the high places (Hebron, Bethel, etc.). Jerusalem was a holy city before it fell to David.

Between the mountainous country of Judaea and the maritime plain is an undulating region anciently known as the Shephelah. It is composed of horizontal strata of limestone, forming groups of hills intersected by a network of small and fertile valleys. In this region, which is of great historical importance, are the remains of many ancient cities.

On the east side of the watershed the ground slopes rapidly from its height of 2,500 ft. above sea-level to a maximum depth of 1,300 ft. below sea-level, within a distance of about 20 miles. It is a waste, destitute of water and with but scanty vegetation. It has never been brought into cultivation; but in the first Christian centuries the caves in its valleys were the chosen refuge of Christian monasticism. It descends to the level of the Ghor by terraces, deeply cut through by profound ravines such as the Wadi es-Suweinit, Wadi Kelt, Wadi ed-Dabr, Wadi en-Nar (Kedron) and Wadi el 'Areijeh.

The southern district, which includes the white marl region of Beersheba, was in ancient times called the Negeb. It is a wide steppe region over which Israel's hold at first was but very slight (Simeon). The high ground in ancient Samaria includes the limestone mass of Mt. Ephraim, with the higher ground near the Jordan rift, and the western plateau merging more with the lowland than is the case in Judaea. Jebel Fuku'a (Gilboa) forms the watershed at the eastern extremity of the plain of Esdraelon, and is an outlier of Eocene rocks. The range of Carmel (highest point 1,810 ft.) runs from the small plain of Meri-el Ghuruk, though interrupted by many passes, to the end of the promontory which makes the harbour Haifa, at its foot, the best on the Palestine coast. Carmel is essentially an outpost of the hill country flanked by the maritime plain on one side and by the plain of Esdraelon on the other. The highest land in Samaria is in the neighbourhood of Nablus (Shechem)—city of refuge and regional focus. The hills include the rugged bare mass of Gerizim (Jebel-et-Turs), 2,849 ft., the smoother cactus-clad cone of Ebal (Sleimtye) 3,077 ft., and farther south Tell 'Asur, at which point begins the Judaean range. On the eastern side of the watershed the most important feature is perhaps the great valley system that connects the Mukhnah (the plain south of Nablus) with the Ghor—beginning with the Wadi Bilan and proceeding through the abundantly watered Wadi Far'a.

The Galilean Mountains and the Plain of Esdraelon.—The Galilean mountains, north of the plain of Esdraelon, fall into two regions, divided by a line joining Acre with the north end of the Sea of Galilee. The northern region (Upper Galilee) is virtually an outlier of the Lebanon mountains. At the north end is an elevated plateau, draining into the Kasimiya. The face toward the Jordan valley is lofty and steep. The highest point is Jebel Jermak, 3,934 feet. The region is fruitful, and in places well wooded. The southern region (Lower Galilee) shows somewhat different characteristics. It consists of chains of comparatively low hills, for the greater part running east and west, enclosing a number of elevated plains. The principal of these plains is El-Buttauf, a tract 400 to 500 ft. above sea-level, enclosed within hills 1,700 ft. high. It is marshy at its eastern end and very fertile. This is the plain of Zebulun or Asochis, of antiquity. The plain of Tur'an, south-east of El-Buttauf, is smaller, but equally fertile. Among the principal mountains of this district may be named Jebel Tur'an, 1,774 ft., and Jebel et-Tur (Tabor) 1,843 ft.; the latter is an isolated mass of regular shape which commands the plain of Esdraelon. Eastward the country falls to Jordan rift by a succession of steps, among which the lava-covered Sahel el-Ahma lies west of the cliffs overhanging the Sea of Galilee. The chief valleys of this region are the Nahr Na'aman with its branches, which runs into the sea south of Acre, and the Nahr-el-Muqatta', or Kishon, which joins the sea at Haifa. On the east may be mentioned the Wadi er-Rubadiya, Wadi el-Hamam and Wadi Fajjas.

The great plain of Esdraelon, as has been shown, is one of the most important natural features of western Palestine. It is a large triangle, having its corners at Jenin, Jebel et-Tur and the outlet of the Nahr-el-Muqatta', by which it communicates with the sea-coast. On the south-west it is bounded by the range of hills that terminates in the spur of Carmel. Historically it let in the invaders—merchants and soldiers—that ruined the distinctive traditions of Israel. In the winter it is swampy (Jud. v., 19–21) and in places almost impassable, though the fertility of this region is proverbial. Megiddo guards the entrance from the south. There are several small subsidiary plains extending from it both north and south into the surrounding mountain region. East of the watershed is a number of valleys running to the Ghor, the most remarkable of which are the Wadi el-Bireh and the Wadi Jalud.

Climate.—The physical structure has a definite bearing upon the many local peculiarities of climate. Palestine is open to the influences of the Mediterranean and thereby escapes the excessive drought of the interior of Arabia and Syria. The westerly winds associated with rain-bearing cyclonic storms are felt in the Mediterranean in winter, and strike the coast of Palestine, giving very heavy rains. At the same time the interactions of the moist warm air over the Mediterranean and the denser, colder, drier air in winter over Asia Minor and Arabia give an extension to the cold dry air of the interior of Asia, a feature giving a winter snowfall to the Judaean hills and the mountains of the north. Even in winter the deep Jordan valley is relatively warm, as the air is heated as it blows down from the north and west. The winter westerlies deposit their rain on the long westward-facing slopes, leaving the eastern scarp of the Jordan rift almost rain-free. The winds are warmed again in the deep valley and on cooling deposit further rain on the slopes of oak-forested Gilead.

The winter rains die away about Easter time. These are "the latter rains" of the Old Testament that foretell of heat and the ripening of crops. What rain falls in summer is mainly associated with local thunderstorms, due to the interaction of the land and sea air. In the hot dry summer, with dust-laden winds blowing from the desert over Palestine, the thermometer occasionally registers as much as 100° F in the shade, though 80°–90° is the more normal maximum. In the Jordan valley the temperature may reach 130°. The temperature may range, within 24 hours, from freezing point to 80°; this daily alternation of temperature may cause the wind to veer round the whole circle of the compass in a day (Eccl. i., 6). In October come "the former rains," which are the signal for winter ploughing. After October the winter westerlies set in again. The mean annual rainfall along the coastal area is about 28 in., although in exceptional years as much as 10 in. more are registered.

Although Palestine gets a great deal of rain, much of the water percolates through the large expanses of limestone rock and is thus wasted. Springs where the water rushes out from its subterranean channels are important, and wells were eagerly sought after in early times. They were often the cause of disputes among a shepherd group (Gen. xxvi., 17–25, and xxi.–xxv.). The countryside is fitted with ancient cisterns that tell of former works of irrigation. Besides the remains of ancient cisterns are the ruined aqueducts at Jericho, Caesarea and other places, as well as the large reservoirs known as Solomon's pools, in a valley between Jerusalem and Hebron, by which the former was supplied at one time with water. Hot springs are found at El-Hamma, about 1 m. south of Tiberias, at Zerka Mah'in (Calirrhoe), El-Hamma below Gadara, and also hot sulphur springs on the west side of the Dead sea. Irrigation and terrace cultivation are the keynote to the prosperity of Palestine.

Flora and Fauna.—The flora of Palestine has a considerable range and variety owing to the variation in local climatic conditions. In the Jordan valley the vegetation has a semi-tropical character. The coast-plain has the ordinary vegetation of the Mediterranean littoral. In the mountains the flora is, naturally, scantier than in these two more favoured regions, but even here there is a rich variety. In all parts of the country the contrast between the landscape in early spring and later, after the cessation of rains when increase of heat has burnt up the vegetation, is very remarkable.

It has been calculated that about 600 different species of vertebrate animals are recorded or still to be found in Palestine. The most important domestic animals are the sheep and the goat; the breed of oxen is small and poor. The camel, the horse and the donkey are the draught animals.

It is important to remember that the horse was a comparatively late introduction and is not mentioned until nearly the end in Genesis. In the dry regions it was somewhat of a luxury. Wild cats, cheetahs and leopards are found, but they are rare, especially the latter. The lion is extinct. The most important wild animals are the hyena, wolf (now comparatively rare), fox and jackal. Bats and rodents abound; the coney is heard of still near the Dead Sea, where the ibex also is found. Among the most characteristic birds may be mentioned eagles, vultures, owls, partridges, bee-eaters and hoopoes; singing birds are on the whole uncommon. Snakes—many of them venomous—are numerous, and there are many varieties of lizards. The crocodile is seen very rarely in the Nahr ez-Zerka. Scorpions and large spiders are universal.

Defence.—In Palestine, as in 'Iraq (*q.v.*), responsibility for defence rests upon Great Britain as a legacy from the World War. After its conclusion British troops were kept in the country which was combined with Egypt in a military command. On their withdrawal in the interests of economy, a Palestine gendarmerie was established, but this experiment not having met with success, a British cavalry regiment was sent back in 1924–5, but this has since been withdrawn, and in 1926 a Trans-Jordan frontier force of mounted riflemen was raised with an establishment of 782, including 17 British and 23 local officers, and 15 British warrant officers, the other ranks being Muslim and Christian Arabs, Jews, Circassians, Druses, Egyptians, Sudanese and of other races. This force is administered by the Palestine Government, but, as in 'Iraq, under control of the Royal Air Force commander. British regular officers are appointed for two years, with extensions. Establishment in the ranks is for three years. The mounted riflemen carry swords and lances for ceremonial only. There is also a police force of 1,750 (245 British) armed with rifles, but not liable for military service, under a British commandant.

ARCHAEOLOGY

Archaeology.—Placed on the edge of the partial desert that separates Asia from Africa, Palestine was from the beginning a halting place in the line of communication between the two. Monarchs of the old world seeking empire in Syria or in Egypt, and trade caravans passing from one country to the other, were alike bound to pause, before or after crossing the intervening wastes. Its relatively long and open coastline exposed it also towards the sea; while the desert tracks from Arabia, converging upon its frontiers to the East and South, were a further source of contact and infiltration. So that though primarily the pathway of greater nations, Palestine became from earliest times the meeting place of peoples varying in race and civilization, in religion and modes of life.

Tell el Hesy.—The complex character of the archaeological problems that awaited the investigator was made evident by the first piece of scientific excavation undertaken in the country. This was organized in 1890 by the Palestine Exploration Fund, which had already accomplished the great task of mapping and surveying the country. The site chosen under the political circumstances of the day, namely the city-mound of Tell el Hesy, lay well within the Egyptian sphere, being situated almost upon the high-road from Gaza to Jerusalem, sixteen miles only from the former and half way to Beit-Jibrin. Flinders-Petrie, who in Egypt (*see* Sequence Dating) had succeeded in grouping and classifying the Egyptian types by series corresponding to the historic epochs of that country, understood the task. He reported at the time, "A clear section of the town had been cut away by a torrent, so that any level could be worked at ease. In these circumstances a few weeks sufficed to obtain pottery of each age, from the Amorite to the Greek times." The specimens so obtained were classified according to their levels, and the recognition of Egyptian objects among them at certain depths enabled the outline of a chronological scale to be established.

Further excavation of the mound upon these lines subsequently showed that the accumulation of 65ft. of debris represented the stratified remains of eleven successive cities. The time scale was indicated in the third city by the discovery of an inscribed tablet and Egyptian objects of the 14th century B.C., and in the fourth city by further Egyptian relations of the 19th dynasty. Above this level iron replaced bronze as the characteristic metal, and finally the appearance of Attic Greek and later wares in the 7th and 8th centuries displayed the further evolution of the site with certitude. The most conspicuous building of the earliest period was a stoutly built tower, the walls of which were nearly 10ft. thick; and it was attributed, together with the foundations of the site, to the 17th century B.C., a date to which other cities of the maritime plain, including Ascalon and Dora, are found to trace their origin. The name of the city, to be inferred from indications on the inscribed tablet, was Lachish, which Egyptian records show to have had some military importance in the 18th dynasty, agreeing with later Hebrew tradition relating to the period of Joshua. Fortified by Rehoboam, Lachish was later one of the strong cities of Judah captured by Sennacherib, incidents in its history which are represented by the stratifications exposed during the excavation. The city of the Assyrian period would be that in level VI., at which time its walls were 10 to 12ft. thick. The Assyrian

king made it his headquarters and a bas-relief in the British Museum shows him receiving there the submission of Jewish prisoners. Several other city-mounds in the neighbourhood of Beit Jibrin were examined; but there was still much to be learnt. The attainment of these encouraging first results had been favoured by a rare combination of circumstances. The strata of Tell el Hesy were exceptionally uniform and free from interruption;

but in general this is not the case. In cities of increasing prosperity the larger buildings of each age were frequently given foundations which descended to and through the lower levels, disturbing the normal stratification in the process, while sometimes it is found that stout buildings survived throughout several succeeding epochs. For such reasons intrusions in the strata are the rule rather than the exception, and excavators must be prepared for such problems and to explain their cause. Only one third of the mound of Tell el Hesy had been dug, and the examination of four mounds during the two following years was only cursory and incomplete. Nevertheless at Tell el Zakarieh a large amount of pottery fragments, together with scarabs, beads and articles of bronze, gave proof of close connection with Egypt, under the new empire. At Tell el Safi it was possible to follow the line of fortifications around the hill; shafts sunk to the rock in a number of places showed the thickness of the debris to be over 40ft. and traced the origin of the city to the Bronze Age. At a depth of 20ft. there was found a series of monoliths, evidently the remains of a High Place; and at a higher level, pertaining to the early Iron age, there was a Jewish stratum containing jar handles with royal stamps assigned to the time of the kings of Judah. Higher still in the debris there were traces of the Crusaders, and near the surface sherds of modern Arab pottery. In the third mound also, Tell el Judeideh, a city wall was followed around the hill and four gateways were examined; but the date of these fortifications remains doubtful, though there were indications pointing to the origin of the city in the late bronze age. At Tell Sandahanna, identified with Mareshah, an entire town of the Seleucidan era was excavated, with towers, walls, gates, streets and houses, of which a complete plan was made, and below this were found remains of Jewish occupation. Tomb chambers of the third century B.C. discovered independently of the excavations were decorated with frescoes of hunting scenes, on which appear the lion and elephant and other fauna foreign to Palestine, together with funerary inscriptions of a Phoenician family from Sidon.

Gezer Excavation.—It became clear at this stage that the excavation of these sites involved much more than normal stratifications illustrating local arts and activities. There were evident traces of direct foreign impact and immigration which it was necessary to distinguish, and the difficulty of discrimination was greater in the deeper levels where the source and character of these intrusions were alike unknown. The Palestine Exploration Fund determined in 1902 to attack the site of Gezer on a scale hitherto unprecedented, and Dr. Macalister devoted himself to the task of obtaining and recording the whole of the information which that great and historic mound contained. This undertaking marks a definite stage of progress in archaeological research in Palestine. The work was continued during four consecutive years and was again resumed for a further three years, and a new system of classification was introduced.

The origin of the site was traced to the settlement in "Neolithic" times of a race of men, small in stature, who dwelt in caves and cremated their dead, placing the remains in the caves with provisions and foodstuffs. The culture of that age was characterized by hand-made pottery and flint implements. Domestic animals included the sheep, cow, pig and goat, and grindstones suggested that cereals were already cultivated. To the same period apparently are to be attributed some rough drawings, which however in their artistic qualities are not comparable with those of the late palaeolithic age in Europe. Eleven scarabs and other objects indicated contact with Egypt as early as in the 12th dynasty, about 2000 B.C. At that time the site was surrounded by a stone wall ten to eleven feet in thickness, provided with long narrow towers and stout gateways, and constructed of large irregular undressed stones, the open joints being packed with small stones. Two towers of rude rubble were faced with sun-baked bricks, a style more recently observed at Shechem and not unknown in the Hittite area in the north of Syria. The burials of these days were made by inhumation in caves, accompanied, as in Egypt, by objects and provisions. At a later period, beginning with 1400 B.C., there was a larger outer wall, provided with no less than 30 towers both external and internal. The whole was constructed of fairly large stones roughly dressed, but covered with mud. A great castle, the walls of which were in some places 9ft. thick, was erected at this time and it lasted with occasional restoration throughout the epochs of three subsequent cities down to 100 B.C. In religion the worship of Astarte was prevalent; more primitive cults are indicated by the "high places," analogous to that of Petra, and standing monoliths or mazzebahs, and there were traces of child burial and sacrifices. There is evidence of contact with Egypt, in the age of Amenhetep III. and IV., when (in substantiation of the records) those cities in the north of Palestine showed traces of the Hittite-Amorite invasion. A further dis-

covery of peculiar interest, as affecting foreign relations, was made in a group of masoned tombs, unlike any others of the site, which were found to contain ornaments and other objects of gold, silver, alabaster. These recalled the art of Cyprus in Sub-Mykenaean times (L.M. III. b.) and may be attributed to Aegean intruders. As elsewhere a period of Jewish habitation was indicated by a number of inscribed jar handles, and the Assyrian occupation left its traces in two inscribed tablets dating from 651 to 648 B.C.

The development of the mound at Gezer may be regarded as generally typical of its area. The evidence of Aegean intrusion, corresponding so nearly in date to the coming of the Philistines (in the age of Rameses III.) were especially significant; and the suggestion was borne out by parallel discoveries made at Ain Shems (1911 and 1912). Here also a city wall was traced, though the excavation was hampered by the remains of the monastery of Byzantine date. East of the city, outside the wall, pieces of pottery were found, some of which resembled wares of the Aegean islands and even Knossos, dating approximately to the 14th century B.C., a Mediterranean infiltration now found to characterize the special culture of the late bronze age, particularly in the northern cities. Pottery of the "Philistine" stratum, that is, the early iron age, is comparable in general style and technique with specimens from Gezer and bears out the Aegean character of that intrusion. Higher in the accumulation of debris, pottery was recognized as dating probably from the period of the kings of Judah, to whom might be attributed the construction of the city wall. There were clear indications of a siege and of the destruction of the city, which after a further interval appears to have been burnt a second time and completely destroyed. In the central portion of the city were the remains of a "high place"; and near by a cave was found which had been used as a place of burial during the earliest period of occupation. In the neighbouring tombs, which were cut in the rock, many objects of coloured pottery, scarabs, beads, seals, collars and bracelets indicated contact with Egypt at various epochs, and a number of bronze objects added to the collection of material available for study.

The examination of these six cities in the Shephelah traced, then, the origins of human settlement in Palestine to the late stone age and the beginning of village life to the early bronze age. Thereafter the occupation may be regarded as generally continuous, through successive stages of culture, influenced from various foreign sources, into historic times. The Egyptian contacts of the 12th, 18th and 19th dynasties correspond with the known activities of the Pharaohs, but it is noticeable that these Egyptian "intrusions" affected little, if at all, the local arts. The Aegean and Mediterranean relations corresponding to the 18th dynasty were widespread, and produced a marked effect here as elsewhere upon the characteristic culture of the period. The later and distinctive appearance of sub-Mykenaean products corresponds with other indications of the Philistine origins, and is traceable generally throughout the plain. The later Jewish, Hellenistic and Roman phases of the iron age culture come within history. Meanwhile the examination by Dr. Sellin and others of two famous sites in the north, Taanak and Megiddo, though on a small and preliminary scale, gave indication of parallel epochs of development upon similar lines, with, however, much variety of detail. Both shared in the high culture of the late bronze age, as was indeed to be inferred already from the Egyptian scenic records of the spoils taken by Thothmes III. at Megiddo. Yet a comparison of results made it already clear that wider and more exhaustive excavation was necessary before any general criteria of the archaeology of Palestine could be established.

At Jericho, indeed, as might perhaps have been anticipated, the signs of Egyptian and Aegean influences were relatively meagre; and the city itself, which seems to have flourished to an exceptional degree during the middle bronze age (the Hyksos period) was destroyed and apparently remained in ruins during the great period of the cities of the north, to revive only partially in the early iron age. These conclusions, it is true, correspond in broad lines with Hebrew tradition, but they are derived from a reinterpretation of the results of the excavation, and this fact illustrates the chief difficulty of the day. Comparative data were essential at this stage to further progress and they were not available. Meanwhile Père Vincent, who had followed the progress of archaeological researches from the beginning, had rendered signal service in 1907 by the publication of his synthetic study "Canaan," in which the results of all excavations made up to that time were scrutinized and compared, and the foundations of comparative archaeology were laid down.

Post-War Work.—The acceptance by Great Britain of the mandate for Palestine at the close of the war resulted in material developments which gave great impetus to the progress of archaeological research. A British school was established in Jerusalem, and entered at once into collaboration with the *École Biblique* and the American School of Oriental Studies. In order to facilitate the co-ordination of results it was jointly agreed to adopt the now familiar divisions of the bronze age, (early, middle and late), to connote the chief phases of Canaanitish culture previous to 1200 B.C. The beginnings of this period can only be estimated at about 2500 B.C., but the end corresponds historically with the invasions of iron-using sea peoples and the Philistines, and this date is found to be generally applicable, though local variation has been observed by Sir William Flinders Petrie at Tell el Sharia on the southern frontier.

The British school was entrusted with the organization of an official Department of Antiquities, charged with the protection of the historical sites and monuments of the country, and a law was promulgated for that purpose, in which equitable facilities were offered to scientific excavation. The consequent establishment of a central museum at Jerusalem made it possible to develop and concentrate collections of specimens not only for the satisfaction of public interest but to serve as a basis for comparative study. Finally the improvement in public security enabled exploration to be extended to areas not hitherto investigated, and the British school devoted its earliest efforts to the cutting of sections in a number of sites on the plains of Akka, Esdraelon and Sharon, followed by the exploration of caves in Eastern Galilee. The American school under Dr. Albright led the way in a new era of topographical research upon scientific lines, testing the indications of Biblical and Egyptian history by the more precise archaeological evidences now becoming available. Meanwhile inspectors of the new department examined and registered no fewer than 2,000 historical sites.

Under these new conditions excavations have recommenced in unprecedented numbers throughout the country. In many cases work is still proceeding and the results are only reported as yet in summary form, so that any attempt at a general survey would be premature and might prove misleading. The sites under investigation range from the sources of the Jordan to the Egyptian frontier, from Ascalon on the coast of Philistia to Jerash and Amnan beyond the Jordan. Light is thrown by the immediate results upon every known period of cultural development, from the oldest stone age to the Crusades. A mere recital of the names and situations of the sites and the chief results will indicate the importance and comprehensive nature of this development.

Main Results.—In all some twelve or fourteen sites have been under exploration. Caves in Galilee have furnished traces and remains of primitive man of the old stone age. Upon the coastlands, mounds in the plain of Akka, Tell Harbaj and others, and caves in the neighbouring hills of Carmel and of Galilee, illustrate the local arts and foreign influences of all periods of the bronze age and early iron age, showing general parallelism with the development of culture elsewhere, but with marked traces of intrusive elements. South of Carmel, on the coast, Dora seems to have been founded in the middle bronze age, and in Hellenistic times it was a flourishing stone-built city. On the Philistine coast Ascalon traces its origin to the same epoch as Dora. The Philistine levels here were hardly explored, being reached with difficulty; they underlay the imposing remains of the prosperous Roman period, in particular the Senate house, with its elaborate cloisters, and other public buildings of that time. At Tel Mersim (possibly Kirjath Sepher) the site was defended by a stone wall already in the bronze age, and the whole plan of the city in the early iron age,

FIGS. 1–13.—SPECIMENS OF ARCHAEOLOGICAL POTTERY VESSELS

1. Red clay vessel, from Tomb 3, Ophel, Early Bronze Age. 2. Red clay jug from Gezer, Late Bronze Age. 3. Buff clay vessel, Middle Bronze Age. 4. Vessel from Cave 2, Gezer, Early Bronze Age. 5. Buff clay bowl from High Place Grotto, Palestine, Middle Bronze Age. 6. Buff clay bowl, Late Bronze Age. 7. Orange clay bowl, Late Bronze Age. 8. Reddish clay bowl with white ash from Ascalon, Early Iron Age. 9. Orange clay jug from Tomb 1, Ain Shems, Palestine, Iron Age. 10. Buff clay vessel from Tomb 1, Ain Shems, Palestine, Iron Age. 11. Rough clay bowl from Tomb viii., Ain Shems. 12. Black clay Hellenistic vase from Tell Sandahannah. 13. So-called Philistine type jar of light yellow slip on buff clay from Gezer, Early Iron Age

with its streets, houses and gates, has been recovered. In the plain of Esdraelon the huge mound of Megiddo is now in process of complete excavation. A settlement of Neolithic date has been found at its foot, and a city-level of Israelitish period has been laid bare upon the top. There is record of the invasion of Pharaoh Shishak, hitherto unconfirmed, and trace of Hittite penetration in the 14th century, parallel with discoveries at Beisan. On the central ridge, at Balata near Nablus, the ancient walled city of Shechem is being uncovered. The stout defences of the late bronze age with a doorway of north-Syrian "Hilani" type, enclose a sanctuary and palace of that period and in its upper strata buildings of Israelitish origin. Further south the site of Seilun, thought by some to be that of Shiloh, has been examined, but though a "high place" and pottery of the late bronze and early iron age was found, the results on the whole were inconclusive. At Tel Nazbeh, north of Jerusalem, the excavation of a walled city with prodigiously strong defences is now proceeding. Here the origins of settlement are traced to the earliest phase of the bronze age, to which period also the foundations of the defensive ramparts pertain. In the late bronze age a higher wall with a stout revetment surrounded the enclosure. In places the wall still stands to a height of 27ft. with a thickness of 16 to 20ft., which is increased at the bottom by the revetment to no less than 46ft. The inscription on a jar handle suggests that this was the site of Mizpeh, but the point is not settled. Finally, at Jerusalem itself the city of the Jebusites on mount Ophel has been located and the stone wall with revetment of the late bronze age has been laid bare. The whole cultural sequence is now richly illustrated at various stages by marked styles in the ceramic wares, and it may soon be possible to distinguish the local elements and assign them to their original areas and cultural sources. The brightest period in the Canaanitish civilization was clearly that of the late bronze age, 1600 B.C. to 1200 B.C., when, by the testimony of these and earlier excavations, Palestine was a land of walled and prosperous cities sharing a high and distinctive culture which is reflected in the contemporary records of the Pharaohs. The prevailing worship at this age was that of Astarte to whom shrines are found in every site that has been sufficiently explored, together with objects of the cult, as at Beisan (the biblical Bethshan) where work was earliest begun and has now been proceeding for four or five years. Here various strata of the late bronze age have been examined to a depth of 27ft. below the surface, and tombs of the period have contributed their testimony. The temple of the goddess was renewed at successive building epochs. Direct corroboration is given to the history of Egyptian activities in the area as derived from Egyptian sources. The domination of Syria by Thothmes III. in the 15th century B.C., the penetration of the Hittites and their allies from the north in the age of Akhenaten (as indicated in the letters found at Tell el Amarna), and the subsequent efforts of Seti I. and Rameses II. in the 13th century B.C. to regain their lost Syrian possessions are definitely substantiated. Monuments of the last named Pharaohs, inscribed in Egyptian hieroglyphs, were found in strata of their period, and the texts give an account of military dispositions taken in the neighbourhood, a prelude to the conflict with the Hittite forces at Kadesh on the Orontes, *c.* 1288 B.C. A reliable historical basis, thus established, will in due time extend to every site.

Roman Age.—Relatively little archaeological material has been found pertaining to the early historical epochs of the Israelites and the Philistines, and the development of Hellenism. The prosperity of the Roman Age, already indicated by visible monuments scattered about the country, particularly by the Graeco-Roman cities of Samaria and Gerasa has already received material illustration. Before the war, excavations on the former site conducted by Dr. Reisner, had disclosed (in addition to the foundations of the royal palace of Ahab) the Senate house and forum of Herod's creation Sebaste, as well as portions of the masoned ramparts and western gateway. Since then the Palestine Explora-

tion Fund, at Ascalon, has uncovered the remains of another Senate House on a similar but larger plan, and has laid bare the foundations of the famous peristyle with which Herod the Great adorned the favoured city of his birth. The style of decoration is Corinthian, and there are indications that many elements of the building were shipped bodily from abroad. The full splendour and appearance of these columned cities is however to be seen now in the unparalleled result of uncovering the ruins of Gerasa (now Jerash), in the course of the work of consolidation which the government of Trans-Jordan has undertaken. There the whole *via principalis,* a kilometre in length, is now cleared from gate to gate, showing the original pavement and the masoned side-walks for the most part intact. The temples, theatres, nymphaeum and triumphal arch, are being steadily brought to light and put into repair; numerous inscriptions are already recovered, as well as objects of sculpture and architectural carvings. A local museum is established, so that this unique city of the Decapolis may now be visited and visualized upon the spot.

The later monuments of Graeco-Roman style, notably the Synagogues of Galilee have also received a share of active attention. That of Tell Hum (Capernaum), which had long lain in ruins as a result of earthquake has been partly reconstructed; and that of Kerazi (Chorazim) has been cleared of debris and made accessible to visitors. Mention must be made, in concluding this brief list, of the mediaeval buildings of Palestine and Trans-Jordan. The Crusaders' castles at Athlit, upon the coast, and at Ajloun, which overlooks the Jordan valley near Jerash, no less than the standing walls of Jerusalem itself, are among the most imposing antiquities of the country. But by far the best preserved and most extensive monument of the period is to be seen at Kerak near the eastern shores of the Dead sea and only to be reached by a relatively long journey by Amman. Here, crowning a hill-top, the vast stronghold of the Saracens rests upon a veritable labyrinth of earlier fortifications, the origin of which is traced at least to pre-Roman date. These buildings are all included in the programme of conservation which the governments responsible under the mandate have drawn out, and are classed among the promising sites available for investigation.

HISTORY

I. OLD TESTAMENT PERIOD

Palestine is a land of small divisions not forming a separate entity. In the words of Sir George Adams Smith (*The Historical Geography of the Holy Land,* p. 58), it "has never belonged to one nation and probably never will." Its position gives the key to its history. Along the west coast ran the old road for traders and for the campaigns which have made the land famous. The seaports (more especially in Syria, including Phoenicia), were well known to the pirates, traders and sea-powers of the Levant. The southernmost, Gaza, was joined by a road to the mixed peoples of the Egyptian Delta, and was also the port of the Arabian caravans. Arabia, in its turn, opens out into both Babylonia and Palestine, and a familiar route skirted the desert east of the Jordan into Syria to Damascus and Hamath. Damascus is closely connected with Galilee and Gilead, and has always been in contact with Mesopotamia, Assyria, Armenia and Asia Minor. Palestine lay at the gate of Arabia and Egypt, and at the tail end of the states stretching down from Asia Minor. Encircled by famous ancient civilizations, its history cannot be isolated from that of the surrounding lands. Recent research, in bringing to light considerable portions of long-forgotten ages, is revolutionizing those impressions which were based upon the Old Testament—the sacred writings of a small fraction of this great area—and a broad survey of the vicissitudes of this area furnishes a truer perspective of the few centuries which concern the biblical student. The history of Israel is only part of the history of Palestine, and this is part of the history of a very closely interrelated portion of a world sharing many similar forms of thought and custom. The close of Old Testament history (the book of Nehemiah) in the Persian age forms a convenient division between ancient Palestine and the career of the land under non-oriental influence during the Greek and Roman ages. It also marks the culmination of a lengthy historical and religious development in the establishment of Judaism and its inveterate rival Samaritanism. The most important data bearing upon the first great period are given elsewhere in this work, and it is proposed to offer here a more general survey. *See* further JEWS.

Prehistory.—To the prehistoric ages belong the palaeolithic and neolithic flints, from the distribution of which an attempt might be made to give a synthetic sketch of early Palestinian man. (H. Vincent, *Canaan d'après l'exploration récente,* pp. 374 *sqq.*, 392–426.) The discovery (1925) in a Galilaean cave of part of a Neanderthal skull, associated with Mousterian tools, has proved the antiquity of culture in Palestine and has also shown that it was not isolated. A burial cave at Gezer revealed the existence of a race of slight build and stature, muscular, with elongated crania, and thick and heavy skull-bones. The people lived in caves or rude huts, and had domesticated animals (sheep, cow, pig, goat), the bones of which they fashioned into various implements. Physically they are quite distinct from the normal type, also found at Gezer, which was taller, of stronger build, with well-developed skulls, and is akin both to the Sinaitic and Palestinian type illustrated upon Egyptian monuments from *c.* 3000 B.C. to the modern native. At what period Palestine first became the "Semitic" land which it has always remained, is uncertain; nor can one decide whether the megalithic monuments, especially to the east of the Jordan, are due to the first wave which introduced the Semitic (Canaanite) dialect and the place-names. At all events during the last centuries of the third millennium B.C., remarkable for the high state of civilization in Babylonia, Egypt and Crete, Palestine shares in the active life and intercourse of the age; and while its ports and fertile fields are visited by Egypt, Babylonia had already claimed supremacy as far as the Mediterranean. (*See* further CANAAN.)

Egyptian Suzerainty.—A definite stage is reached in the period of the Hyksos (*c.* 1700), the invaders of Egypt, whose Asiatic origin is suggested *inter alia* by the proper-names which include "Jacob" and "Anath" as deities. After their expulsion Egypt at once enters upon a series of campaigns in Palestine and Syria as far as the Euphrates, and its successes over a district whose political fate was bound up with Assyria and Asia Minor laid the foundation of a policy which became traditional. Apart from rather disconnected details, which belong properly to the history of Babylonia and Egypt, it is not until about the 16th century B.C. that Palestine appears in the clear light of history, and henceforth its course can be traced more continuously. Of fundamental importance are the cuneiform tablets discovered at Tell el-Amarna in Egypt in 1887, containing some of the political correspondence between Western Asia and Egypt for a few years of the reigns of Amenophis III. and IV. (*c.* 1411–1360). The first Babylonian dynasty, famous for its Khammurabi, belonged to the past, but the cuneiform script and language are still used among the Hittites of Asia Minor (centring at Boghaz-keui) and the kings of Syria and Palestine. Egypt itself was now passing from its greatness, and the Hittites (*q.v.*) were its rivals for the possession of the intervening lands. Peoples apparently of Indo-Iranian connection from the powerful state of Mitanni (Northern Syria) had already left their mark as far south as Jerusalem, as may be inferred from the personal names; and in addition to the intercourse with Aegean culture (revealed by excavation), the tablets add references to mercenaries and bands from Meluḫḫa (Arabia),

Mesopotamia and the Levant.

The Amarna Age.—The small cities of this cosmopolitan Palestine were ruled by kings, not necessarily of the native stock; and the slight extent of these city-states is obvious from the references to the kings of such near-lying sites as Jerusalem, Gezer, Ashkelon and Lachish. Apart from Jerusalem and a few towns on the coast, the real weight lay to the north, and especially in Amor (*see* AMORITES). It is an age of internal disorganization and a heavy pressure by land and by sea from Northern Syria and Asia Minor. Palestine seethes with excitement, wavering between allegiance to Egypt and intrigues with the great movements at its north. The letters vividly describe the approach of the enemy, and, in appealing to Egypt, abound in protestations of loyalty, complaints of the disloyalty of other kings and excuses for the writers' suspicious conduct. Of exceptional interest are the letters from Jerusalem describing the hostility of the maritime coast and the disturbances of the Ḥabiru, a name which, though often equated with that of the Hebrews, may have no ethnological or historical significance. At all events, the hostility of the Ḥabiru cannot be isolated from that in other letters (where the enemy are otherwise described), and their steps do not agree with those of the invading Israelites in the book of Joshua. The history of the age illustrated by the Amarna letters is supplemented by the tablets found at Boghaz-keui, the capital of the old Hittite Empire. Subsequent Egyptian evidence records that Seti I. (*c.* 1321 B.C.) of the XIXth Dynasty led an expedition into Palestine, but struggles with the Hittites continued until Rameses II. concluded with them an elaborate treaty which left him little more than Palestine (1272 B.C.). Even this province was with difficulty maintained: the disturbances in the Levant and in Asia Minor (which belong to Aegean and Hittite history) and the revival of Assyria were reshaping the political history of Western Asia.

Under Rameses III. (*c.* 1200–1169) we may recognize widespread disorganization in the movements in which the Philistines (*q.v.*) participated. Nevertheless, Egypt seems to have enjoyed a fresh spell of extended supremacy, and Rameses apparently succeeded in recovering Palestine and some part of Syria. But it was the close of a lengthy period during which Egypt had endeavoured to keep Palestine detached from the rest of south-west Asia, and Palestine had hard experience of the powerful empire at its south-western border. Somewhat later Tiglath-Pileser (*c.* 1115) pushed the limits of Assyrian suzerainty westwards over the lands formerly held by the great Hittite Empire. Palestine had hitherto been bound up with Egypt, the Hittites and Mitanni, with the Amorites north of Lebanon and with the Philistine invaders. For centuries it had had a stirring history. We now reach the Israelite period.

The Hebrew Monarchy.—At an age when there were no great external empires to control Palestine Israel arose and claimed a premier place amid its neighbours (*c.* 1000). How the small rival districts with their petty kings were united into a kingdom under a single head is a disputed question; the stages to the independent Hebrew state with its national god Yahweh are still an unsolved problem. Biblical tradition itself quite plausibly represents a mighty invasion of tribes who had come from Southern Palestine and Northern Arabia (Elath, Ezion-geber)—but primarily from Egypt—and, after a series of national "judges," established the kingship. But no place can be found for this conquest, *as it is described,* either before the "Amarna" age (the date, following 1 Kings vi. 1) or about the time of Rameses II. and Merneptah (*see* Exod. i. 11); and when the latter king (*c.* 1233) records the subjugation of the people (or tribe) "Israel," it does not follow that this "Israel" was identical either with the Israelite tribes which invaded the land or with the intermixed people after this event. Whatever may have been the extent of the Israelite invasion and the sequel, the rise and persistence of an independent Palestinian kingdom depended upon its relations with the maritime coast (Philistia and Phoenicia), Edom, Moab, Ammon, Gilead and the Syrian states; and the biblical and external records for the next four centuries (to 586) frequently illustrate situations growing out of this interrelation. The evidence for these crucial years is unequal and often sadly fragmentary, and is more conveniently noticed in connection with the biblical history. A conspicuous feature is the difficulty of maintaining a single monarchy (*see* SAUL, DAVID, SOLOMON), which, however it originated, speedily became two rival states (Judah and Israel). These are separated by a very ambiguous frontier, and have their geographical and political links to the south and north respectively. The balance of power moves now to Israel and now to Judah, and tendencies to internal disintegration are illustrated by the dynastic changes in Israel and by the revolts and intrigues in both states. As the power of the surrounding empires revived, these entered again into Palestinian history. As regards Egypt, apart from a few references in biblical history (*e.g.*, to its interference in Philistia and friendliness to Solomon), the chief event was the invasion by Sheshonk (Shishak) *c.* 930 B.C.; but although it appears to be an isolated campaign, contact with Egypt never ceased. The next definite stage is the dynasty of the Israelite Omri (*q.v.*), to whom is ascribed the founding of the city of Samaria. The dynasty lasted nearly half a century, and is contemporary with the expansion of Phoenicia, and presumably therefore with some prominence of the south maritime coast. The royal houses of Phoenicia, Israel and Judah were united by intermarriage, and the last two by joint undertakings in trade and war.

Assyria and Armenia.—Meanwhile Assyria was gradually establishing itself westwards, and a powerful confederation of the heirs of the old Hittite kingdom, "kings of the land of Ḥatti" (the Assyrian term for the Hittites), was formed to oppose it. Southern Asia Minor, Phoenicia, Ammon, the Syrian Desert and Israel (under Omri's son "Ahab the Israelite") sent their troops to support Hamath and Damascus which, in spite of the repeated efforts of Shalmaneser III. (859–824), was evidently able to hold its own so long as the alliance endured. But the anti-Assyrian league was, as often in west Asia, a temporary one, and the inveterate rivalries of the small states are illustrated in a striking manner in the downfall of Omri's dynasty and the rise of that of Jehu (841); the bitter onslaughts of Damascus upon Israel, leading nearly to its annihilation; an unsuccessful attack upon the king of Hamath by Damascus, Cilicia and small states in north Syria; an Israelite expedition against Judah and Jerusalem (2 Kings xiv. 13 *seq.*); and finally the recovery and extension of Israelite power—perhaps to Damascus—under Jeroboam II. In such vicissitudes as these Palestinian history proceeds upon a much larger scale than the national biblical records relate and the external evidence is of the greatest importance for the light it throws upon the varying situations. The heirs of the old Hittite and Mitannian states stood behind the rivalries of Syrian and Palestinian kings. Assyria and Van or Urartu (Ararat, the later Armenia) were the great protagonists; and it is in the light of far-reaching moves and countermoves that one must interpret the isolated or incomplete narratives of Hebrew history. Adad-nirari III. (811–782) claims as tributary the land of the Hatti, Amor, Tyre, Sidon, "the land of Omri" (Israel), Edom and Philistia; but there followed a period of weakness for Assyria, when Urartu controlled the destinies of the petty states and Jeroboam restored the glories of Israel. But at his death Israel was rent by divided factions, whereas Judah (under Uzziah) had become a powerful kingdom, controlling both Philistia and the Edomite port of Elath on the gulf of 'Akaba. The dependence of Judah upon these districts was inevitable; the resources of Jerusalem obviously did not rely upon the small district of Judah alone. If Ammon also was tributary (2 Chron. xxvi. 8, xxvii.), political dealings with Israel and perhaps Damascus could probably be inferred. (*See* JEWS, § 9.)

Predominance of Assyria.—A new period begins with Tiglath-Pileser III. (745–727). Pro- and anti-Assyrian parties make themselves strongly felt, and when north Syria was taken in 738, Tyre, Sidon, Damascus (under Rezin), "Samaria" (under Menahem), and a queen of Aribi were among the tributaries. It is possible that Judah (under Uzziah and Jotham) had come to an understanding with Assyria; at all events Ahaz was at once encircled by fierce attacks, and was only saved by Tiglath-

Pileser's campaign against Philistia, north Israel and Damascus. With the siege and fall of Damascus (733–732) Assyria gained the north, and its supremacy was recognized by the tribes of the Syrian desert and Arabia (Aribi, Tema, Sheba). In 722 Samaria, though under an Assyrian vassal (Hoshea), joined with Philistia in revolt. In 720 it was allied with Gaza and Damascus; and the persistence of unrest is evident when Sargon in 715 found it necessary to transport into Samaria various peoples of the desert. Judah itself was next involved in an anti-Assyrian league (with Edom, Moab and Philistia), but apparently submitted in time. Nevertheless a decade later (700), after the change of dynasty in Assyria, it participated in a great but unsuccessful effort from Phoenicia to Philistia to shake off the yoke, and suffered disastrously (*see* HEZEKIAH). With the crushing blows upon Syria and Samaria the centre of interest moves southwards and the history is influenced by Assyria's rival Babylonia (under Marduk-baladan and his successors), by north Arabia and by Egypt. Henceforth the history of Samaria is ignored by the biblical writers; and of Judah, for nearly a century, few political events are recorded. Judah was under Assyrian supremacy, and, although it was involved with people of the Arabian desert in the revolt planned by Babylonia (against Assurbanipal), it appears to have been generally quiescent.

Egypt and Babylon.—At this stage disturbances, now by Aramaean tribes, now by Arabia, combine with the new rise of Egypt and the weakness of Assyria to mark a turning-point in the world's history. Psammetichus (Psamtek) I. (663–609) with his Greeks, Carians, Ionians and soldiers from Palestine and Syria, established once more an Egyptian Empire, and replaced the loose relations between Palestine and the small dynasts of the Delta by a settled policy. The effort was made to re-establish the ancient supremacy over Palestine and Syria. The precise meaning of these changes for Palestinian history and life can only incompletely be perceived, and even the significance of the great Scythian invasion and of the greater movements with which it was connected is uncertain (*see* SCYTHIA). A weak Assyria was falling before the Chaldaean Nabopolassar, the founder of the Neo-Babylonian empire. Nineveh fell in 612 and the government removed to Harran. Necho of Egypt marched into Asia to help Assyria—though not unready to take advantage of her troubles. Josiah of Judah, in turn, was perhaps not without hopes of utilizing the situation. He was overthrown at Megiddo, where about nine centuries previously the victory of Thutmosis III. had made Egypt supreme over Palestine and Syria. But Egypt was at once confronted by Nabopolassar who, as the heir of Assyria, claimed the Mediterranean coast-lands. The defeat of Necho by his son Nebuchadrezzar at Carchemish (605) is one of the world-famous battles.

Although Syria and Palestine now became Babylonian, the revival of Egypt aroused hopes in Judah of deliverance and led to revolts (under Jehoiachin and Zedekiah), in which Judah was apparently not alone. They culminated in the fall of this kingdom in 586. Henceforth the history of Palestine is disconnected and fragmentary, and the few known events of political importance are isolated and can be supplemented only by inferences from the movements of Egypt, Philistia or Phoenicia, or from the Old Testament. The Babylonian Nabonidus (553) found it necessary to quell the coastlands; and claims that all the kings from Gaza to the Euphrates assisted in his buildings. Chaldean policy generally appears to have been favourable towards faithful vassals. But a new age had now dawned in the east in the person of Cyrus the Great the leader of the Persians. After a series of successes he captured Babylonia (559), and forthwith claimed, in his famous inscription, the submission of Amor.

The Persian Empire.—The petty states of Palestine and Syria now became part of one of the largest empires of antiquity. The prophets who had marked in the past the advent of Assyrians and Chaldeans fixed their eyes upon the advance of Cyrus, confident that the fall of Babylon would bring the restoration of their fortunes. Cyrus was hailed as the divinely appointed saviour, the anointed one of Yahweh. The poetic imagery in which the prophets clothed the doom of Babylon, like the romantic account of Herodotus (i. 191), falls short of the simple contemporary account of Cyrus himself. He did not fulfil the detailed predictions; nevertheless, if Cyrus was not a worshipper of Yahweh (Isa. xli. 25), he was tolerant towards subject races and their religions, and the Jews received marked favour. Throughout the Persian age Palestine was naturally influenced by the course of events in Phoenicia and Egypt. Thus, when Cambyses, the son of Cyrus, made his great expedition against Egypt, with the fleets of Phoenicia and Cyprus, and with the camels of the Arabians, Palestine itself was doubtless involved. Also, the revolt which broke out in the Persian provinces at this juncture may have extended to Palestine; although the usurper Darius encountered his most serious opposition in the north and north-east of his empire. An outburst of Jewish religious feeling is dated in the second year of Darius (520), but whether Judah was making a bold bid for independence or had received special favour for abstaining from the above revolts, external evidence alone can decide. Towards the close of the reign of Darius there was a fresh revolt in Egypt; it was quelled by Xerxes (485–465), who did not imitate the tolerance of his predecessors.

Under Artaxerxes I. Longimanus (465–425) flourished the Jewish reformers Nehemiah and Ezra (*see* JEWS). Revolts occurred in Egypt, and for these and also for the rebellion of the Persian satrap Megabyxus, independent evidence for the position of Judah is needed, since a catastrophe apparently befell the unfortunate state before Nehemiah appears upon the scene. Little is known of the mild and indolent Artaxerxes II. Mnemon (404–359). With the growing weakness of the Persian empire Egypt reasserted its independence for a time. In the reign of Artaxerxes III. Ochus (359–338), Egypt, Phoenicia and Cyprus were in revolt; the rising was quelled without mercy, and the details of the vengeance are suggestive of the possible fate of Palestine itself. The Jewish historian Josephus (*Ant.* xi. 7) records the enslavement of the Jews, the pollution of the Temple by a certain Bagoses (*see* BAGOAS), and a seven years' punishment. Other late sources narrate the destruction of Jericho and a deportation of the Jews to Babylonia and to Hyrcania (on the Caspian Sea). The evidence for the catastrophes under Artaxerxes I. and III. (*see* ARTAXERXES), contained in biblical and in external tradition respectively, is of particular importance, since several biblical passages refer to disasters similar to those of 586 but presuppose different conditions and appear to be of later origin. The murder of Artaxerxes III. by Bagoses gave a set-back to the revival of the Persian Empire. Under Darius Codomannus (336–330) the advancing Greek power brought matters to a head, and at the battle of Issus in 333 Alexander settled its fate. The overthrow of Tyre and Gaza secured the possession of the coast and the Jewish state entered upon the Greek period. Very gradually the face of history had been undergoing a complete change. The old empires of the Near East had practically exhausted themselves. Egypt had resumed its earlier connections with the Levantine heirs of the old Aegean world. Once more the tide was to flow from the west to the east, and centuries were to pass before the oriental world reasserted itself in the rise of Christianity, the establishment of Rabbinical Judaism and the revival of oriental paganism.

Internal Changes.—In the age of the Assyrian supremacy Palestine entered upon a series of changes, lasting for about three centuries (from about 740), which were of the greatest significance for its internal development. The sweeping conquests of Assyria were "as critical for religious as for civil history" (Robertson Smith, *Rel. of the Semites*, p. 58). The brutal methods of warfare, the harsh treatment of vanquished districts or cities, and the redistribution of bodies of inhabitants, broke the old bonds uniting deities, people and land. The framework of society was shattered, communal life and religion were disorganized. As the flood poured over Syria and flowed south, Israel (Samaria) suffered grievously, and the gaps caused by war and deportation were filled up by the introduction of new settlers by Sargon, and by his successors in the 7th century. Unfortunately, there is very little evidence in the biblical history for the subsequent career of Samaria; but it is clear that the old Israel of the dynasties of

VIEWS IN JERUSALEM AND BETHLEHEM

1. Main façade of the church of the Holy Sepulchre, at Jerusalem, which was finished in its present form by the Crusaders in 1099. The church was first built by Constantine in 336 on the site believed by him to be that of the tomb of Christ
2. Water carriers of Jerusalem filling their goat skin bags at a well in the court of the Dome of Rock, built or adapted A.D. 691. This mosque is generally believed to occupy the site of Solomon's Temple
3. "The Garden Tomb," in the rocks outside Jerusalem, which in the opinion of General C. G. Gordon and others was the sepulchre in which Christ was buried. It is sometimes called "Gordon's Tomb of Christ"
4. Tomb of Absalom outside the city walls of Jerusalem. The monument dates from the Graeco-Roman period
5. Street scene in Bethlehem
6. The Pool of Siloam within the city walls of Jerusalem. Excavations here revealed a bath house of the period of Herod (40 B.C.–A.D. 4). The pool is 52 feet long and 19 feet wide

Omri and Jehu received crushing blows. The fact that among the new settlers were desert tribes, suggests the introduction, not merely of a simpler culture, but also of simpler groups of ideas. In the nature of the case, as time elapsed the new population must have taken root as securely as—one must conclude—the invading Israelites had done some centuries earlier. As a matter of fact the prophets Jeremiah and Ezekiel by no means regarded the population lying to the north of Judah as strangers; there is hope of a reunion of the rival districts, indeed a new Israel—in the larger sense—was growing up. The north was ready to share the Judaean distress at the fall of Jerusalem (Jer. xli. 5), and in later years offered to assist in rebuilding Yahweh's temple. In fact, since the Samaritans subsequently accepted the Pentateuch, and claimed to inherit the ancestral traditions of the Israelite tribes, it is instructive to observe how this people of singularly mixed origin so thoroughly assimilated itself to the land and at first was virtually a Jewish sect.

But Samaria was not the only land to suffer. Judah, towards the close of the 8th century, was obviously very closely bound up with Philistia, Edom and Egypt; and this and Hezekiah's dealings with the anti-Assyrian party at Ekron do not indicate any feeling of national exclusiveness, or abhorrence of the "uncircumcised Philistines." From the description of Sennacherib's invasion it is clear that social and economic conditions must have been seriously, perhaps radically disturbed, and the quiescence of Judah during the next few decades implies an internal weakness and a submission to Assyrian supremacy. During the 7th century new movements were coming from the Arabian desert; and tribes growing ever more restless made an invasion east of the Jordan through Edom, Moab and Ammon. Although they were repulsed, this awakening of a land which has so often fed Palestine and Syria, when viewed with the increasing weakness of Assyria, and subsequent vicissitudes in the history of the Edomites, Nabataeans and East Jordan tribes, forbids us to treat the invasion as an isolated raid. Later, the fall of the Judaean kingdom and the deportation of the leading classes brought a new social upheaval. The land was not denuded, and the fact that some scores of thousands of Jews remained in Judah through all the period of the exile (G. A. Smith, *Jerusalem*, ii. 269), even though they were "the poorest of the land," revolutionizes ordinary notions of this period (*see* JEWS, § 13).

In the latter part of the 6th century we find some restoration, some revival of the old monarchy in the person of Zerubbabel (520 B.C.). But not until the middle of the 5th century do the biblical records (book of Nehemiah) furnish a foundation for any reconstruction. Here Jerusalem is in sore distress and in urgent need of reorganization. Zerubbabel's age is of the past, and any attempt to revive political aspirations is considered detrimental to the interests of the surrounding peoples and of the Persian Empire. Scattered evidence suggests that Edomites had been responsible for a new catastrophe. Amid internal and external difficulties Nehemiah proceeds to repair religious and social abuses, and there is an important return of exiles from Babylonia. The ruling classes are related partly to the families of semi-Edomite origin from south Judah and partly to Samaria; but the kingship of old is replaced by a high-priest, and, under the influence of Babylonian Jews of the strictest principles, a breach was made between Judah and Samaria which was never healed. Biblical history itself recognizes in the times of Artaxerxes, Nehemiah and Ezra the commencement of a new era; and although much remains obscure we have in these centuries vicissitudes which separate the old Palestine of Egyptian, Hittite, Babylonian and Assyrian supremacy from the land which was about to enter the orbit of Greek and Roman civilization.

II. FROM ALEXANDER THE GREAT TO A.D. 70

Alexander the Great.—In the year 332 Alexander passed through Palestine to Egypt, capturing Tyre after a siege of seven months and Gaza after a siege of two. He left the Jews undisturbed in their customs and their religion. Some of them enlisted in the intelligence corps of his army (*Ant.* XI.8.5.) and Jews were among the first settlers in the new city he founded in Egypt under the name Alexandria. The high priest remained the head of the little Jewish state in Palestine and he was probably assisted by a council of elders. This *gerousia* is first mentioned as such by Josephus (*Ant.* XII.3.3.) in connection with Antiochus the Great (223–187 B.C.) but appears to go back at least as far as the Persian period (*cf.* II. Chron. xix.8, and *see* Schürer, *Geschichte* 4th ed., II.240).

Alexander died at the age of 32 on June 13, 323, and though the great empire of which he had dreamed fell to pieces at once after his death, his name remained a romantic and glorious memory throughout the nearer East.

Perhaps the most remarkable evidence of the estimation in which he was held by those who survived him is furnished by the splendid "Alexander" sarcophagus of pentelic marble now in the museum at Constantinople. This sarcophagus dates from *c.* 300 B.C., and was probably made by order of Abdalonimus, whom Alexander had appointed king of Sidon. It is one of the most beautiful examples of Greek sculpture which have come down to us, and its representations of Alexander's campaigning include the figures of the king and of his senior adviser, Parmenion.

The Ptolemies.—Palestine now fell to the portion of Ptolemy, the son of Lagus, one of the most astute of Alexander's generals and the first to settle himself in a dominion. He chose Egypt as being rich and comparatively remote, and there he ruled, first as governor in the name of Alexander's infant son, Alexander IV., and then (306 B.C.) as king. Six years before he actually took this title, he had, with the assistance of his friend, Seleucus, another of Alexander's generals, signally defeated the forces of yet another of these generals, Antigonus, at Gaza (312 B.C.) and had become master of Palestine. Seleucus himself, the same year, took Babylon and established the Seleucid dynasty in the north of the country, moving his capital after a victory over Antigonus at Ipsus (301 B.C.) to Antioch on the Orontes. In the meantime Ptolemy had subdued the cities of Coele-Syria (Diodorus XX. 113) and established the northern border of his kingdom on a line just north of Aradus and just south of Emesa. Seleucus felt himself entitled to this territory by the terms of his former agreement with his old friend, but he now found himself unable to establish his claim, and retired under protest. For practically a century Palestine remained subject to Egypt, the northern frontier receding considerably (to the south of Berytus and Damascus) about 250 B.C., and advancing again to the north of Aradus 25 years later (*see* U. Kahrstedt, *Syrische Territorien in hellenistischer Zeit*, map 1a).

The rule of the first Ptolemies was despotic but tolerant. They administered Egypt itself like a huge crown estate. Immense works of irrigation and land improvement were undertaken. Colonies of Greek settlers were planted in various places, although except Alexandria, founded by Alexander himself, and Naucratis and Ptolemais in the south, founded by Ptolemy I. (Soter), there were no large cities in the whole of Egypt which had Greek institutions and a predominantly Greek population. (*See* Rostovtzeff, *History of the Ancient World*, I. 367.) The Ptolemies themselves were men of culture, Greek culture. They took a personal interest in literature and science, founded a great library and academy (museum) and a zoological garden at Alexandria; and generally lived their own life apart. Thus they easily slipped into the traditional position of the rulers of Egypt as divine beings, and as such were accepted by the natives who did their work and paid their dues, and were not otherwise interfered with.

Similarly also, Palestine, the northern part of their dominion, the Ptolemies regarded simply as a valuable source of tribute for their treasury and timber (from the forests of Lebanon) for their shipbuilding, and as a useful buffer against their rivals, the Seleucids. The cities, especially those on the coast and on the east of the Jordan, had for some time been feeling the influence of Hellenic civilization. Not only were there new foundations like Pella and Dion in the Peraea (perhaps of the time of Alexander) and Ptolemy II.'s Philoteria on the sea of Galilee; but

older cities changed their names. Thus, probably during the reign of Ptolemy II., Akka became Ptolemais, and Amman, Philadelphia; and even where the old names were retained, as at Gaza and Ascalon, the process of Hellenization still went on.

Apparently the taxes were farmed out to the highest bidder, and it was possible for the adroit to make a fortune as a merchant-adventurer, or government agent, or both. The discovery of a large collection of papyri from Gerza (Philadelphia) in the Fayum, consisting of the records of Zeno, a Carian Greek in the employ of a high official under Ptolemy II., has recently made a considerable addition to our scanty knowledge of the general conditions of the period. An extensive and carefully regulated trade was being carried on with Egypt in Syrian cloth, for example, and especially in corn; but it is evident that the government regulations were frequently disregarded. It appears indeed as if Syrian oil and slaves, the very articles which were not allowed to be imported into Egypt, were the goods traders dealt in by preference. (Rostovtzeff, *A large Estate in Egypt in the Third century* B.C., p. 34.)

Zeno travelled a good deal in Palestine and particularly mentions a certain Tobias, the owner of a castle (*birta*) in Ammon, with whom he did business and who sent a present to Ptolemy (II.) of horses and dogs, and two white camels. Not improbably this is the building of which ruins still remain at "Arak el-Emir" where, in the entrance to some remarkable cave dwellings near by, the name Tobias may still be read clearly written in Hebrew. On the remains of the wall of this building traces of an animal frieze are to be seen which remind us of the remarkable paintings of animals round the walls of a tomb of this period, discovered about the beginning of this century, at Marissa in Judaea. It was made for a colony of settlers from Sidon (*see* Peters and Thiersch, *Painted Tombs in the Necropolis of Marissa,* 1905).

Of the family of this Tobias (very likely descended from *Tobiah the Ammonite,* Neh. iv. 3) Josephus has an entertaining story to tell (*Ant.* xii. 4). A certain Joseph, the son of Tobiah, managed to out-bid his rivals and to secure the post of chief collector of the taxes. He then showed his patriotism by exacting the whole amount due to the government from the non-Jews in the country, and allowing his own countrymen to escape scot-free. The details of the story need not be pressed, but it seems to be true that the burden of taxation was not felt very heavily and that the people as a whole were fairly content. "The inhabitants of Coele-Syria," says Polybius (V.86.9), "are somehow always more loyally disposed to this family (*i.e.,* the Ptolemies) than to any other."[1] It seems to be true also that the internal affairs of the Jews were largely in the hands of a few families of whom that of Tobias, already mentioned, and the rival family of Onias, which supplied the High Priests, were perhaps the chief.

The Seleucids.—Towards the end of the third century B.C., Antiochus (III.) the Great, who had succeeded to the Seleucid empire in 223 B.C., made a determined attempt to make himself master of Palestine. In 217 B.C. he sustained a severe check at the hands of Ptolemy (IV.) Philopator at Raphia, but Ptolemy IV. died in 205 B.C. and the son (Ptolemy V., Epiphanes) who succeeded him, was a child of five years of age. It may be that the contrast now presented between Alexandria and Antioch suggested the well-known words of Ecclesiastes x. 16, 17: "Woe to thee, O Land, when thy king is a child, and thy princes eat in the morning! Happy art thou, O Land, when thy king is the son of nobles, and thy princes eat in due season, for strength, and not for drunkenness." These words, at all events, would apply very well to the dissolute court in Egypt and the vigorous personality of Antiochus the Great; and some, undoubtedly, among the Jews, were glad when in 198 B.C. Antiochus defeated Scopas, Ptolemy's general, at Paneas and took possession of the country. The city of Gaza alone offered serious resistance, and stood a siege with a fidelity to the house of Ptolemy which provoked the admiration of Polybius (XVI.22); but at length it fell.

The Seleucids had always been much more missionary-hearted in their Hellenism than the Ptolemies. They founded large numbers of Greek cities and regarded themselves as ardent patrons and supporters of Greek city life. The immediate successors of Antiochus the Great found themselves crippled by the tremendous war-indemnity he had agreed to pay the Romans after his disastrous defeat at Magnesia (190 B.C.). The next king but one, Antiochus IV., Epiphanes (175–164 B.C.), seems to have cherished two great ambitions: one to conquer Egypt, and the other to weld together his dominion into a real cultural unity. When the Romans finally put an end to the first (Dan. xi. 30; Polybius xxix. 11) he threw himself all the more zealously into the second. His empire should have one religion, or at least it should unite in the worship of the deity manifest (Epiphanes is short for *Theos Epiphanes,* the god manifest) in himself; viz., Zeus. This was by no means a complete innovation. Antiochus II. (262–246 B.C.) had called himself *Theos.* But no king hitherto had taken the matter so seriously, and enforced a cult throughout his dominions.

Jewish Revolt.—Antiochus met with resistance nowhere but in Palestine. Here the process of Hellenization had been proceeding apace; but when an altar to Zeus was erected on the great altar in the Temple[1] and all observance of the law forbidden by the Seleucid authorities in a deliberate attempt to uproot the Jews' superstition (Tacitus) a great wave of resistance—resistance at first passive[2] and then active and intense—swept over the country. Judas, the third son of an aged priest named Mattathias, proved himself to be a very capable leader, and became known as Maccabaeus (probably *the Hammer*). He carried on a successful guerilla warfare by means of surprises, rapid marches, and night attacks; and at length managed to force his way to the Temple which he had cleansed and re-dedicated on 25 Chislev (December) 165 B.C., exactly three years (according to I. Maccabees) after the setting up of the "'abomination that maketh desolate" (Dan. xi. 31) and the first sacrifice to Zeus.

After a series of little engagements—the size of the forces involved is greatly exaggerated in both I. and II. Macc.—the Seleucid government, having its hands full nearer home, came to terms with the insurgents and granted them religious liberty (163 B.C.). Menelaus, the high priest, being now dead (II. Macc. xiii. 7), Alcimus of the true Aaronite stock, but an ardent Hellenizer, was set up in his place. The most pious section of Judas's followers accepted him at first, but were soon scandalized by his behaviour and with Judas again at their head offered him strenuous opposition. A considerable force under a general called Nicanor was sent to reinforce his dwindling supporters; but it was signally defeated by Judas, and Nicanor himself killed.

The Maccabaean Priest-Princes.—At length the Seleucid government took matters seriously in hand and Judas himself fell fighting against great odds at Elasa (161 B.C.). Again, however, domestic embarrassments at Antioch prevented the central authorities from making a final settlement of the country. This happened time after time during the rest of the century. A succession of rival claimants to the throne appeared, and by playing them off one against another, Judas's brothers and their successors gained various concessions and opportunities to proceed on razzias and small wars of conquest on their own account. Rome, meanwhile, whose influence and interest in the nearer East was steadily growing, connived, and even approved. (I. Macc. viii.). The gradual extension of Jewish territory is shown on the accompanying maps.

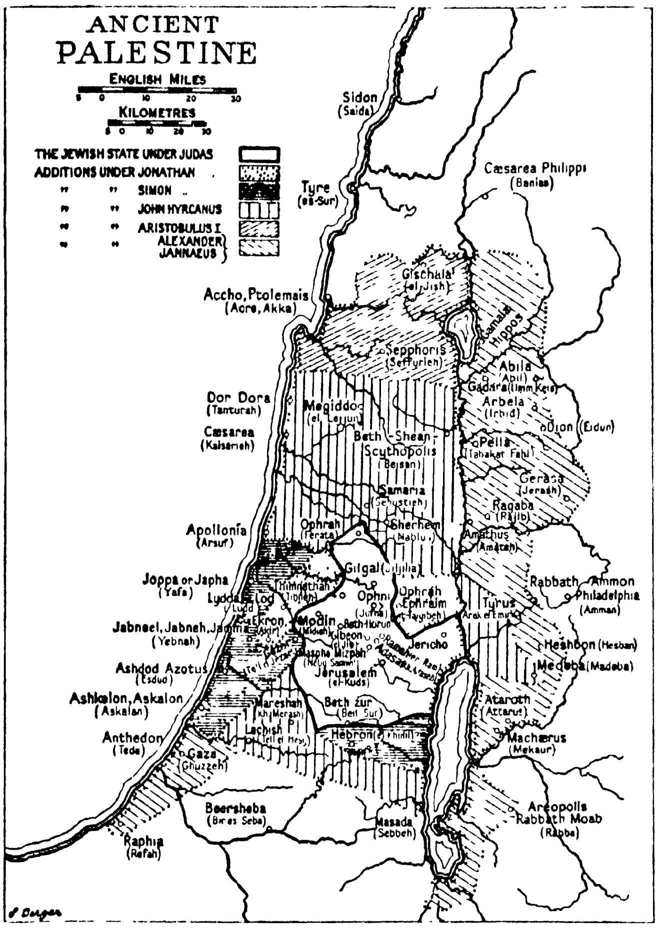
Jonathan (161–143 B.C.) put on the holy garments of the high priest in 153 B.C. (I. Macc. x. 21), and soon after the accession of his brother Simon (143–135 B.C.) the high-priesthood was

[1]On the relations between the Palestinian Jews and the Jews in Egypt (and particularly in Alexandria) see *Art.* JEWS.

[1]The sacrifice to Zeus was offered presumably by the Jewish high priest, Menelaus, who was not improbably a member of the Tobias family. Onias III. of the regular high-priestly family, a conscientious opponent of Hellenization, had been ousted from office and assassinated some time previously; and his son Onias IV., in despair, had fled to Egypt—very likely the family had all along been in league with Egypt—where he founded a new temple to Jehovah at Leontopolis (*c.* 150 B.C.).

[2]At first the pious (Hasidim) were simply butchered (I. Macc. i. 63) and rather than profane the Sabbath by striking a blow died without resistance, on one occasion "to the number of 1,000 souls" (I. Macc. ii. 38).

confirmed to him and his heirs for ever (141 B.C.) "until there should arise a faithful prophet" to determine otherwise (I. Macc. xiv. 41). Some time later (140 B.C.) Simon was granted the right of coining money (probably copper only[1]) and some specimens of "the year four" "of the redemption of Zion" (Nisan 143 being counted as the beginning of a new era Macc. xiii. 42)—still survive. His son, John Hyrcanus I. (135–104 B.C) on his coins,



MAP OF ANCIENT PALESTINE, SHOWING EXPANSION OF JEWISH TERRITORY UNDER THE MACCABEES

John the High Priest conquered and destroyed Samaria and forced the Idumeans to be circumcised He was the first of the Maccabaean princes to employ mercenaries John Hyrcanus made the mistake of quarrelling with the Pharisees and seeking the support of the Sadducees of whom we first hear as distinct parties in this reign (*Ant.* xiii. 10). His immediate successor, Aristobulus I (104–103 B.C) extended his conquests to Galilee and is said to have assumed the title of king (*Ant.* xiii 11) though it does not occur on his extant coins The long reign of his brother, Alexander Iannaeus (103–76 B.C) was full of conflict at home and abroad. He continued his father's policy of forcing outlying regions, including even the Greek cities, to accept either Judaism or annihilation His coins are the first to bear a Greek inscription (on the obverse; Hebrew still on the reverse), and he calls himself plainly King Alexander In 76 B.C. he was killed, fighting at Ragaba on the east of the Jordan His widow, Salome Alexandra, was the zealous patron of the Pharisees who (and especially a famous rabbi of the name of Simon ben Shetach) largely dictated her policy and looked back upon her reign as a foreshadowing of the golden age. At her death (67 B.C.) her two sons, Aristobulus and Hyrcanus fought one another for the succession. At first Hyrcanus, the elder and more indolent of the two, gave way to his younger and more vigorous brother; but he was persuaded by Antipater,

[1]The "thick shekels" of silver which have often been attributed to Simon, are now generally assigned to the revolt of A D. 66–70. *See* B.M. *Catalogue of the Greek Coins of Palestine,* pp. xc. ff., and P.E.F.Q.R. January 1927 pp. 47 ff.

a son of the governor of Idumea, to stir himself to obtain his birthright. At this juncture Pompey appeared on the scene. Both sides appealed to him and after some delay he decided in favour of Hyrcanus (II.), whom he set up, not as king, but as high priest of the Jews (63 B C.).

Pompey curtailed the Jewish dominions and freed a number of Greek cities, including those of the federation known as the Decapolis. During the disturbances which followed Pompey's death (48 B C.) Antipater and his family rose to greater and greater power. For some services he was able to render to Julius Caesar he was rewarded with the Roman citizenship, and the title of Procurator of Judaea[1] Some time before he died one of his sons, Phasael, had become governor of Jerusalem, and another, Herod, governor of Galilee The family of Aristobulus, however, had not given up their designs upon the throne, and in 40 B C his son Antigonus was set up as king at Jerusalem by the Parthians in a sudden invasion. In this invasion Phasael poisoned himself, but Herod escaped.

The Herods and the Procurators.—Herod escaped to Rome and got himself recognized by the senate as king of the Jews. He came back to win his kingdom In the year 37 B C., he laid siege to Jerusalem and married Mariamne, the beautiful heiress of the Maccabaean house An account of his long, and in many respects prosperous, reign (37–4 B.C) is given elsewhere.

When Herod the Great died, the country fell into a turmoil while three of his sons went to Rome to lay their several claims before Augustus. According to the emperor's decision Judaea, Samaria and Idumaea were allotted to Herod Archelaus, Galilee and Peraea to Herod Antipas; Trachonitis, Batanea and Auranitis (districts in the north) to Herod Philip. All the Herods had a strong family likeness. They were all great builders They were all of set policy, double-faced: Jews at home and Hellenists abroad Above all they were determined, at all costs, to be and remain *philoromaioi,* friends of the Romans.

Philip retained his kingdom till his death in A D. 34. Antipas, under the influence of his wife Herodias, grew too ambitious and was banished in A D. 39, but Archelaus ruled so badly that an appeal was made to the emperor against him and he was removed in less than ten years (A D 6). His place was filled by a succession of procurators a poor set of men, of low rank, puffed up with their own importance. They made Caesarea on the sea-coast their headquarters and, with the aid of a few auxiliary troops, kept such order as they could. Pontius Pilate (A D 26–36) was the fifth of them.

For a short time the whole of Palestine was reunited under King Herod Agrippa I (A D 37–44) grandson of Herod the Great, boon companion of Caligula and friend of Claudius; and, except that he was unusually good-natured, a typical Herod. When he died his kingdom was not given to his son, but it was placed under a new succession of procurators who were made responsible to the governor of Syria.

But the country was now getting out of hand, and the Roman authorities were as ill at ease as the British were in Ireland in the first quarter of the present century In fact the two situations are closely parallel the differences in temperament and religion, the assassins (*sicarii*), the stern reprisals

Rebellion.—At length under Gessius Florus rebellion broke out openly (A.D 66). An initial success against Cestius Gallus, the governor of Syria, who had tried to intervene with forces too weak to cope with the overwhelming (though ill-armed and undisciplined) numbers of the rebels, gave them undue and misleading encouragement. But when the Romans took the matter seriously and sent Vespasian and Titus with three legions and auxiliary troops numbering altogether some 60,000[2] men, the result was a foregone conclusion.

Indeed, the Jews themselves for the most part recognized it as such, and the only determined resistance the Romans met with occurred at a few strongholds like Iotapata in Galilee and above all at the capital itself. Jerusalem was captured in Sept A.D 70. In spite of Titus's express orders to the contrary, the Temple was

[1]Hyrcanus, at the same time (47 B.C.) received the title of Ethnarch
[2]Schürer [4] I. p. 611.

destroyed; and, finally, only a portion of the city wall was left standing. Its ruins became the headquarters of the Tenth Legion which for some years was kept in Palestine on garrison duty.

BIBLIOGRAPHY.—The best introduction to this period of Palestinian history for the general reader is E. R. Bevan, *Jerusalem under the High Priests* (2nd Impression, 1912); E. Meyer, *Ursprung und Anfänge des Christentums* (1921) contains a valuable survey of the period in vol. ii. with many references to recent literature. E. Schürer, *Geschichte des jüdischen Volkes im Zeitalter Jesu Christi* (4th ed. 1901–09) begins with the Maccabaean revolt, and is indispensable (with useful bibliographies). Among recent monographs of a more specialized character may be mentioned: U. Kahrstedt, *Syrische Territorien in hellenistischen Zeit* (1926) already referred to, and W. Kolbe, *Beiträge zur syrischen und jüdischen Geschichte* (1926). For the general conditions of the period *see* W. W. Tarn, *Hellenistic Civilization* (1927; with a valuable bibliography). (J. W. Hu.)

III. FROM A.D. 70 TO THE TURKISH CONQUEST

Political History from A.D. 70.—The destruction of Jerusalem was followed by the dispersal of the Jews, for whom till then it had been the religious and political centre. The first seat of the sanhedrin was at Jamnia (Yebna), where the Rabbinic system began to be formulated. The rigid code of dogmas and observances elaborated by the rabbis exercised a singularly uniting power over the scattered nation and prevented such an absorption of the Jewish people into the Roman empire as had caused the disappearance of the ten tribes of Israel in Assyria.

It would appear that at first, after the destruction of Jerusalem, no specially repressive measures were contemplated by the conquering Romans, who rather attempted to reconcile the Jews to their subject state by a leniency which had proved successful in the case of other peoples brought by conquest within the empire. But they had reckoned without the isolating influence of Rabbinism. Here and there small insurrections took place, in themselves easily suppressed, but showing the Romans that they had a turbulent and troublesome people to deal with. At last Hadrian determined to stamp out this stubborn Jewish nationalism. He issued an edict forbidding the reading of the law, the observance of the Sabbath, and the rite of circumcision; and determined to convert the still half-ruined Jerusalem into a Roman colony.

The consequence of this edict was the meteor-like outbreak of Bar-Cochba (*q.v.*) A.D. 132–135. The origin of this person and the history of his rise to power are unknown. It was his recognition as the Messiah by the celebrated Rabbi Akiba, then the most influential Jew alive, which placed him in the command of the insurrection, with 200,000 men at his command. Jerusalem was captured, as well as a large number of strongholds and villages throughout the country. Iulius Severus, sent with an immense army by Hadrian, came to quell the insurrection and recaptured Jerusalem. The rebels fled to Bethar—the modern Bittir, near Jerusalem, where the fortress garrisoned by them still remains, under the name Khurbet el-Yahud, or "Ruin of the Jews"—and were there defeated and slaughtered in a sanguinary encounter. Hadrian then turned Jerusalem into a Roman colony, changed its name to Aelia Capitolina, built a temple of Jupiter on the site of the Jewish temple and (it is alleged) a temple of Venus on Mt. Golgotha and forbade any Jew, on pain of death, to appear within sight of the city.

This disaster was the death-blow to hopes of a Jewish national independence, and the leaders of the people devoted themselves thenceforth to legal and religious study in the Rabbinical schools, which from A.D. 135 (the year of the suppression of the revolt) onwards developed in various towns in the hitherto despised province of Galilee. Seffurieh (Sepphoris) and especially Tubariya (Tiberias) became centres of this learning and the remains of synagogues of the 2nd or 3rd century which still exist in Galilee attest the strength of Judaism in that district during the years following the abortive attempt of Bar-Cochba.

Palestine continued directly under Roman rule. East of the Jordan, Cornelius Palma added Gilead and Moab to the empire under Trajan in A.D. 105. In 295 Auranitis, Batanea and Trachonitis were brought within the provincial system.

The conversion of Constantine to Christianity—or rather the profession of Christianity by Constantine—seemed likely to result in another Jewish persecution, foreshadowed by severe repressive edicts. This, however, was averted by the emperor's death.

The progress of the corrupt Christianity of the empire of Byzantium was checked for a while under Julian the Apostate, who, among other indications of his opposition to Christianity, rescinded the edicts against the Jews on his coming to the throne in 361, and gave orders for the restoration of the Jewish temple. The latter work was interrupted almost as soon as begun by an extraordinary phenomenon—the outburst of flames and loud detonations, easily explained at the time as a divine judgment on this direct attempt to falsify the prophecy of Christ.

On the partition of the empire, in A.D. 395, Palestine naturally fell to the share of the emperor of the East. From this onwards for more than 200 years there is a period of comparative quiet in Palestine; the only history it displays being that of the development of pilgrimage and of the cult of holy places and of relics, varied by occasional persecutions of the Jews. The elaborate building operations of Justinian (527–565) must not be forgotten. The "Golden Gate" of the Temple area and part of the church which is now the El-Aksa Mosque at Jerusalem, are due to him.

This interval of tranquillity came abruptly to an end in 611, when Chosroes II. (*q.v.*), king of Persia, made an inroad into Syria; joined by the Jews, anxious to revenge their misfortunes, he swept over the country, carrying plunder and destruction wherever he went. Jerusalem was taken; the Holy Sepulchre church was destroyed and its treasures carried off; the other churches were likewise razed to the ground; the patriarch was taken prisoner. Thus for a time the province of Syria with Palestine was lost to the empire of Byzantium.

The Emperor Heraclius reconquered the lost territory in 628. But his triumph was short-lived. A more formidable enemy was already on the way, and the final wresting of Syria from the feeble relics of the Roman empire was imminent. (L. St.; F. M. S.)

Rise of Islam.—The separate tribal units of Arabia, more or less impotent when divided and at war with one another, received for the first time an indissoluble bond of union from the prophet Mohammed, whose perfect knowledge of human nature (at least of Arab human nature) enabled him to formulate a religious system that was calculated to command an enthusiastic acceptance by the tribes to which it was primarily addressed. His successor, Abu Bekr, called on the tribes of Arabia to unite and to capture the fertile province of Syria from the Christians. Heraclius had not sufficient time to prepare to meet this new foe, and was defeated in his first engagement with Abu Bekr. (For the general history of this period *see* CALIPHATE.) The latter seized Bostra and proceeded to march to Damascus. He died, however, before carrying out his design (A.D. 634), and was succeeded by Omar, who, after a siege of 70 days entered the city. Other towns fell in turn, such as Caesarea, Sebusteh (Samaria), Nablus (Shechem), Lydd, Jaffa.

Meanwhile Heraclius was not idle. He collected a huge army and in 636 marched against the Arabs. The latter retreated to the Yarmuk River, where the Byzantines met them. Betrayed, it is said, by a Christian who had suffered personal wrongs at the hands of certain of the Byzantine generals, the army of Heraclius was utterly defeated, and with it fell the Byzantine empire in Syria and Palestine.

After this victory Omar's army marched against Jerusalem, which after a feeble resistance capitulated. The terms of peace, though on the whole moderate, were of a galling and humiliating nature, being ingeniously contrived to make the Christians ever conscious of their own inferiority. Restrictions in church-building, in dress, in the use of beasts of burden, in social intercourse with Muslims and in the use of bells and of the sign of the cross were enforced. When these terms were agreed upon and signed Omar, under the leadership of the Christian patriarch Sophronius, visited the Holy Rock (the prayer-place of David and the site of the Jewish temple). This he found to be defiled with filth, spread upon it by the Christians in despite of the Jews. Omar and his followers in person cleaned it, and established the place of prayer which, though later rebuilt, has borne his name ever since.

Dissensions and rivalries soon broke out among the Muslim

leaders, and in 661 Moawiya, the first caliph of the Omayyad dynasty, transferred the seat of the caliphate from Mecca to Damascus, where it remained till the Abbasids seized the sovereignty and transferred it to Baghdad (750). Rivals sprang up from time to time. In 684 Caliph Abdalmalik ('Abd el-Melek), in order to weaken the prestige of Mecca, set himself to beautify the holy shrine of Jerusalem, and built the *Kubbet es-Sakhrah*, or Dome of the Rock, which still remains one of the most beautiful buildings in the world. In 831 the Church of the Holy Sepulchre was restored; but about 100 years later it was again destroyed as a result of the revolt of the Carmathians (*q.v.*), who in 929 pillaged Mecca. This produced a Muslim exodus to Jerusalem, with the consequence mentioned. The Carmathian revolt, one of the first of the great splits in the Muslim world, was followed by others: in 936 Egypt declared its independence, under a line of caliphs which claimed descent from Fatima, daughter of the prophet (*see* FATIMITES); and in 996 Hakim Bi-amrillah mounted the Egyptian throne. This madman caused the church of the Holy Sepulchre to be entirely destroyed: and giving himself out to be the incarnation of Deity, his cult was founded by two Persians, Darazi and Hamza ibn Ali, in the Lebanon; where among the Druses it still persists (*see* DRUSES).

The contentions between the Abbasid and Fatimite caliphs continued till 1072, when Palestine suffered its next invasion. This was that of the Seljuk Turkomans from Khorasan. On behalf of their king, the Khwarizmian general Atsiz invaded Palestine and captured Jerusalem and Damascus, and then marched on Egypt to carry out his original purpose of destroying the Fatimites. The Egyptians, however, repulsed the invaders and drove them back, retaking the captured Syrian cities.

The Crusades.—The sufferings of the Christians and the desecrations of their sacred buildings during these troubled times created widespread indignation through the West. The Church responded, and a motley crowd, principally of French origin, set out in 1096 for the Holy Land. Others, under better generalship, followed; but of the 600,000 that started from their homes only about 40,000 succeeded in reaching Jerusalem, ill-discipline, famine and battles by the way having reduced their ranks. They captured Jerusalem, however, in July 1099, and the leader of the assault, Godfrey of Boulogne, was made king of Jerusalem.

So was founded the Latin kingdom of Jerusalem, whose history is one of the most painful ever penned (*see* CRUSADES). It is a record of almost unredeemed "envy, hatred and malice," and of vice with its consequent diseases, all rendered the more repulsive in that its transactions were carried on in the name of religion. For 88 turbulent years this feudal kingdom was imposed on the country, and then it disappeared as suddenly as it came, leaving no trace but ruins, a few place-names, and an undying hereditary hatred of Christianity among the native population.

The abortive second crusade (1147), led by the kings of France and Germany, came to aid the rapidly weakening Latin kingdom after their failure to hold Edessa against Nureddin, the ruler of northern Syria.

In 1173 Nureddin died, and his kingdom was seized by Saladin (Salah ed-Din), a man of Kurdish origin, who had previously distinguished himself by capturing Egypt in company with Shirkuh, the general of Nureddin. Saladin almost immediately set himself to drive the Franks from the country. The Frankish king was the boy Baldwin IV., who had paid for the errors of his fathers by being afflicted with leprosy. After being defeated by Saladin at Banias, the Franks were compelled to make a treaty with the Muslim leader. The treaty was broken, and Saladin proceeded to take action. The wretched leper king meanwhile died, his successor, Baldwin V., also a young boy, was poisoned and the kingdom passed to the worthless Guy de Lusignan, who in the following year (1187) was crushed by Saladin at the battle of Hattin, which restored Palestine to the Muslims.

The third crusade (1189) to recover Jerusalem was led by Frederick I. of Germany. Acre was captured, but quarrels among the chiefs of the expedition made the enterprise ineffective. It was in this crusade that Richard Coeur-de-lion was especially distinguished among the Frankish warriors.

Saladin died in 1193. In 1198 and 1204 took place the fourth and fifth crusades—mere expeditions, as abortive as the third. And as though it were foreordained that no element of horror should be wanting from the history of the crusades, in 1212 there took place one of the most ghastly tragedies that has ever happened in the world—the crusade of the children. Fifty thousand boys and girls were persuaded by some pestilent dreamers that their childish innocence would effect what their immoral fathers had failed to accomplish, and so left their homes on an expedition to capture the Holy Land. The vast majority never returned; the happiest of them were drowned in the Mediterranean.

The other four crusades which took place from time to time down to 1272 are of no special importance, though there is a certain amount of interest in the fact that after the sixth crusade, in 1229, Emperor Frederick II. was permitted to occupy Jerusalem for ten years. But a new element, the Mongolians of Central Asia, now bursts in on the scene. The tribes from east of the Caspian had conquered Persia in 1218. They were driven westward by pressure of the Tatars, and in 1228 had been called by the ruler of Damascus to his aid. In 1240, however, they transferred their alliance to the sultan of Egypt, and pillaged northern Syria. Driven downward through Galilee they seized Jerusalem, massacred its inhabitants and plundered its churches. They then marched on to Gaza, where the Egyptians joined them, and together inflicted a crushing defeat on the Christians and Muslims of Syria, for once compelled to unite by the common danger. The Khwarizmians and Egyptians afterwards quarrelled, and the former were compelled to retire, leaving Palestine under the rule of the Mameluke sultans of Egypt. Shortly afterwards however, another Central Asiatic invasion—that of the Tatar tribes, took place. Under their leader Hūlagū these tribes came by way of Baghdad, which they captured in 1258, and in 1260 they attacked and captured Damascus and ravaged Syria. Bibars (Beibars, Baibars), general of the Egyptian sultan Kotuz, met and drove them back; and having murdered his master, became sultan in his stead. He then proceeded to attack and destroy the relics of Christian possession in Palestine. One after another—Caesarea, Safed, Jaffa, Antioch—they fell, leaving at last Acre (Akka) only. Bibars died in 1277, and in 1291 Acre itself was captured by Khatēl, son of Kala'ūn, who put an end to Frankish rule.

During the 14th century there is little of interest in the history of Palestine. The Christians made efforts to creep back to their former possessions and churches were rebuilt in Jerusalem, Bethlehem and Nazareth; but another devastation was the result of the ferocious inroads of the Mongolian Timur (Tamerlane) in 1400. (F. M. S.)

IV. FROM THE TURKISH CONQUEST TO 1929

The penultimate stage of the history of Palestine was reached in 1516 when the war between Sultan Selim the Grim and the Mameluke rulers of Egypt resulted in the transference of the country to the victorious Turks. This change of rulers produced little change in the administration or condition of the country. Local governors were appointed from Constantinople where revenues were annually sent; various public works were undertaken such as the rebuilding of the walls of Jerusalem by Suleiman the Magnificent in 1537; but on the whole Palestine ceases from this point to have a history till the coming of the 19th century. Its annals record little save the sanguinary quarrels of local sheikhs and the oppression of the peasants by them or by the officials. The most interesting personality in a dreary period is that of the Druse prince Fakhr-ed-din (1595–1634) whose establishment of a Lebanese kingdom which included northern Palestine as far as Acre in defiance of the Turkish sultan, and his dilettante cultivation of art, a consequence of temporary exile in Italy, deserve passing notice. The order imposed by the Turks on a turbulent country did not endure. The German botanist Leonhard Rauwolf, who visited Palestine in 1575 has left a vivid description of the difficulties that beset even so simple a journey as that from Jaffa to Jerusalem. He found Jaffa in ruins. A safe-conduct had to be obtained from the governor of Ramleh before the party could proceed. At Yazur they were stopped by an

official who extorted heavy blackmail on the ground that the sultan had given him charge of the "holy places" and had forbidden him to admit anyone to them without payment Further on they had a scuffle with certain "Arabians" and at last, after accomplishing the passage of the "rough and stony" road that led to Jerusalem they were obliged to dismount before the city-gate till they should receive licence from the governor to enter.

Towards the close of the 18th century a chief named Dhahir el-Amir rose to power in Acre To him fled from Egypt an Albanian slave named Ahmad, who bore the surname of "el-Jazzar" (the butcher) on account of the obedient skill with which he had rid his Mameluke master of numerous rivals He had, however, incurred punishment for indiscipline and so took refuge with the Palestinian chief After five years his former master died and el-Jazzar returned to Egypt Soon Dhahir el-Amir revolted against the Turkish Government and el-Jazzar on account of his long residence with and full knowledge of his protector was commissioned to quell the rebellion. He succeeded and was installed as governor of Acre in Dhahir's place. He had crude aesthetic tastes and Acre owes some public buildings to him, but he was also capricious and tyrannical and lived up to his surname. Till 1791 there was a colony of French merchants with factories and offices at Acre; el-Jazzar that year summarily ordered them to quit the town. In 1798 Napoleon Bonaparte after conquering Egypt invaded Palestine in pursuit of his scheme of stirring up revolt against the Turk in Syria and conquering the Near and Middle East at the head of an adventurer army with a French core. He defeated el-Jazzar and besieged him in Acre, while a relieving column of Turks and local Arab irregulars was completely defeated by his lieutenant, General J B Kléber near Mount Tabor. But the timely arrival of British warships commanded by Admiral Sir Sidney Smith saved Acre A final attempt to storm the town was repulsed and Napoleon withdrew to Egypt

El-Jazzar died in 1806, his successor Suleiman ruled mildly but in 1814 he died and Acre became the prey of the fanatic Abdallah Pasha He caused his Jewish secretary to be murdered, but the Jew, anticipating his doom and determined that his employer should pay dearly for his crime, had secretly arranged that after his own death an inventory of Abdallah's property should fall into the hands of the Government, which had claims on the estates of el-Jazzar and of Suleiman The Government pressed its claims. Abdallah refused to pay and was besieged in Acre. He called upon Mohammed Ali Pasha the powerful governor-general of Egypt to mediate. Mohammed Ali settled the dispute but Abdallah refused to discharge his claims for the arbitration and to hand over political refugees from Egypt The Egyptian had long feared the sultan's jealousy and Abdallah's conduct gave him an excuse for taking the offensive In Nov 1831 he attacked Abdallah by land and sea. Acre was stormed next May and by the end of July all Syria was lost to the sultan The campaigns waged by the Albanian satrap of Egypt against his master and their international consequences are described elsewhere (*see* TURKEY, EGYPT, MOHAMMED ALI). Palestine, which had welcomed the new ruler, soon found it had exchanged King Log for King Stork. A rising in 1834 was ruthlessly suppressed Finally in 1840 the appearance of the British, Austrian and Russian fleets off Beirut and the advance of a Turkish army from the north led to a general revolt in which Palestine joined. Acre surrendered and the Egyptians hastily evacuated the whole country

From 1840 onwards the Turkish Government gradually strengthened its hold on Palestine. The political power of the local sheikhs was greatly reduced, to the unmixed advantage of the whole country; and the increase of European interests led to the establishment of consulates and vice-consulates of the greater powers in Jerusalem and in the ports. The rivalry of religions continued. In 1847 the dispute between Greek Orthodox and Latin ecclesiastics in the Church of the Nativity at Bethlehem, about the right to mark with a star the birthplace of Christ, became one of the prime causes of the Crimean War. On June 30, 1855, on the occasion of the visit of a European prince, the cross was for the first time since the crusades borne aloft through the streets of Jerusalem. Three years later the sacred area of the Haram esh-Sherif—the mosque on the site of the temple of Jerusalem—was for the first time thrown open to Christian visitors The last 40 years of the century were marked by a remarkable process of colonization and settlement—French and Russian monastic and other establishments, some semi-religious and semi-political; German colonies, followed after the imperial visit by more imposing official foundations; fanatical or freakish American communities; Jewish agricultural settlements—all, so to speak, nibbling at the country and each so intent upon gaining a step on its rivals as to be forgetful of the gathering storm In 1896 Dr Theodor Herzl (*q.v.*) issued his proposal for the establishment of a Jewish state in Palestine and in 1898 came to the country to investigate its possibilities (*see* ZIONISM). The same year was marked by the picturesque visit of the German emperor, William II. (R. A S M.)

1900–1918.—The first signs of danger from European rivalries and Turkish Panislamic ambitions became visible early in the 20th century, when schemes for the extension of the Turkish pilgrim railway to the Egyptian border were discussed and surveys undertaken In 1906 came the significant dispute between Great Britain and Turkey concerning the frontier of the Sinai district of Egypt After crossing the border at Rafa south of Gaza and at Akaba, the Turks recoiled before an ultimatum and the frontier was delimited In the same year the opening of a narrow-gauge railway from Deraa on the Damascus line to Haifa increased the trade and prosperity of that port. The Young Turk revolution of 1908 passed off quietly in Palestine where the officials and small garrisons declared for the new regime, and the population acclaimed it with less fervour.

Immediately before the outbreak of the World War Palestine was passably prosperous Jewish colonization, foreign philanthropy, an increasing tourist and pilgrim traffic greatly mitigated the natural poverty of the country The presence of relatively large numbers of foreigners—a few consuls, traders and professional men, many missionaries and teachers and the Jewish and German colonists—improved the amenities of the larger towns and exercised a restraining effect on Turkish officialdom In spite of the rivalry of foreign interests and the mixture of creeds and races the country was spared the crude scandals of Macedonia and Kurdistan. Education—of a sort—was fairly diffused among the townsfolk, more especially among the Jews and Christians, though the missionary schools too often made the Arab into a poor imitation of a European or American rather than into a good citizen of the Ottoman empire Below the peaceful surface there were stirrings, the example of Egyptian progress under British control helped to promote a weak but perceptible Arab nationalism only aiming in Palestine at some form of local autonomy. The Panislamic movement, supported by the Turkish authorities, was a little stronger. Arab Nationalists and Panislamists alike watched Zionist activities with increasing suspicion.

The outbreak of war between the Entente and Turkey brought this quiet period to an end For over two years Palestine was the base of large Turkish forces which occupied Sinai and made two major attacks on the Suez canal. There were allied naval demonstrations on the Palestinian coast. Ahmed Jemal Pasha, governor-general of Syria and commander of the Turkish forces, ruled the country with a rod of iron. The cessation of remittances proved fatal to large numbers of the Jews of the "Haluka" who died of sheer want. The Zionists after enjoying Jemal's favour, incurred his suspicion and suffered much minor persecution; his hand was heavy on all Arabs suspected of Nationalism; locust plagues, conscription and the extreme corruption of the Turkish officers and officials bled the peasantry white. The British counter-offensive which began in the winter of 1916 and the conquest of Palestine are described elsewhere (*see* WORLD WAR; PALESTINE, OPERATIONS IN). The fall of Jerusalem marked its first stage. The Turks and a German contingent retained most of Samaria and all Galilee until their final and complete overthrow in Sept. 1918. The victors, whose behaviour was generally admirable, were well received by the inhabitants of the country. It had suffered much in the past four years but cruelly as the war had thinned the population and wasted the resources

of Palestine, it had had one good result—the linking up of the Haifa and Jerusalem railways with the Egyptian system and the construction by both combatants of a number of wells and bridges and a network of metalled roads. (P. Gr.)

POST-WAR DEVELOPMENTS

Palestine under the Ottoman Government was an integral portion of Syria, although the Sanjaq of Jerusalem, owing to its peculiar problems and importance, was governed by a Mutasarref referring directly to Constantinople. Owing to the economic stagnation and financial strain which affected the whole Ottoman empire in consequence of the Italian (1911–12) and Balkan (1912–13) wars, Palestine was unable to develop herself in any way before the outbreak of the World War. Before 1913 autonomy in the imperial provinces extended in practice only to the right of making recommendations. The Ottoman constitution of 1908 had awakened new hopes, and in Syria and Palestine particularly so widespread a movement began in favour of decentralization that the Turkish Government thought it wise to pass the provisional vilayet laws of 1913 and 1914, granting real local government powers. It is difficult to conjecture now to what extent a naturally intelligent people, discouraged and enfeebled by four centuries of gross misgovernment, might have been helped by plans which were in fact cut short by the war and replaced by the tyranny of Jemal Pasha.

British Military Occupation.—The British occupation, established after the conquest of the country by the British forces under General Allenby in 1917, found a depleted population, the townspeople distressed, much cultivated land untilled, stocks of cattle and horses almost non-existent, orange groves ruined by lack of irrigation and commerce at a standstill. Immediately on the occupation of Jerusalem (Dec. 11, 1917), a military administration was set up, with military governors at Jerusalem and elsewhere; food was hurried up by military transport for the populace, and merchants were permitted to import goods from Egypt by the military railway. In accordance with General Allenby's proclamation, all existing rights in holy places were respected and maintained; further, the income of the Muslim Wakfs (pious foundations) was used exclusively for the Muslim beneficiaries in Palestine instead of being drained away to Constantinople. The administration was, from the outset, financially self-supporting. A local police force was built up, schools and law courts were re-opened, and, in April 1918, a water supply for Jerusalem, utilizing springs employed for the same purpose in the days of Herod and Pontius Pilate, was installed.

Zionism.—On Nov. 2, 1917, some five weeks before Lord Allenby's entry into Jerusalem, Lord (then Mr. Arthur) Balfour, at that time foreign secretary, had made on behalf of the British Government the following historic declaration:—

> His Majesty's Government view with favour the establishment in Palestine of a national home for the Jewish people, and will use their best endeavours to facilitate the achievement of that object, it being understood that nothing shall be done which may prejudice the civil and religious rights of existing non-Jewish communities in Palestine, or the rights and political status enjoyed by the Jews in any other country.

The declaration was endorsed by the principal Allied Powers and embodied in the Treaty of Sèvres, where it was provided that the country should be entrusted to a mandatory Power with a mandate to be approved by the League of Nations. After the Balfour declaration the Zionist organization sent a commission, subsequently constituted as a part of the Zionist executive, to Palestine to act as a link between the British authorities and the Jewish population. This was developed so as to take charge of the larger Jewish interests, colonization, immigration, and education in Palestine. The military administration was, from its inception, assailed with demands on the one hand for an immediate and practical interpretation of the Balfour declaration, and on the other for a policy of entire negation until such time as that instrument should have been incorporated into some sort of mandate formally adopted by the Powers.

The British Government not being in a position to issue even general instructions, the administration, left in a situation without precedent more or less to its own resources, was limited by the legal necessity of governing the country under Ottoman codes amplified by enactments under military law, according to the "laws and usages of war." Even so, however, two notable and, in the circumstances, exceptional steps were taken. Hebrew was recognized with English and Arabic as the third official language, as, with Latin and Greek, it had been in the time of Christ, and considerable agricultural loans were advanced to land-owners. At the same time various oppressive small taxes were abolished. The Jerusalem chamber of commerce was established and followed by others elsewhere. The unsightly wall which had been built across Constantine's Basilica of the Nativity in Bethlehem was removed. Early in 1920 the Muslim Nebi Musa celebrations were exploited as a manifestation of Arab national sentiment against the Zionist Jews, many of whose recent immigrants had excited animosity by unwise and tactless propaganda. Riots took place on April 4 and 5 in Jerusalem and raids were made upon Beisan and the British garrison at Semakh.

On July 1, 1920, a civil Government was established with Sir Herbert Samuel as the first high commissioner of Palestine. But mutual suspicion continued, and with it further incidents; the Jerusalem riots of 1920 were succeeded next year by a serious outbreak in Jaffa and neighbourhood, and again by disturbances in the capital on the fourth anniversary of the declaration[1].

A statement, issued as a White Paper by Winston Churchill, the colonial secretary, whose policy was formally and publicly accepted by the Zionist organization, explicitly disclaimed the intention either of creating a wholly Jewish Palestine or of contemplating the disappearance or the subordination of the Arab population, language or culture.

> The nationality to be acquired by all citizens of Palestine, whether Jews or non-Jews, whether for purposes of internal law or international status would be Palestinian and nothing else. . . . But in order that the Jewish community (in Palestine) should have the best prospect of free development it is essential that it should know that it is in Palestine as of right and not on sufferance. That is the reason why it is necessary that the existence of a Jewish national home in Palestine should be internationally guaranteed. . . .

The statement was rejected by the Palestine Arab delegation, then representing the Arab cause in London, partly because they were at the time committed to demands involving almost a retractation of the mandate and partly from an instinctive reasoning that the policy even so enunciated might ultimately render Palestine Arabs of secondary interest and importance in their own country. This new definition has nevertheless considerably affected Arab opinion, and, as it has been integrally maintained by successive Labour and Conservative cabinets, in each of whom respectively high hopes had been placed by Zionist and Arab "revisionists," it has gone far to convince both of the futility of further agitation. In 1925, on the expiry of Sir Herbert Samuel's term of office, Lord Plumer was appointed high commissioner.

Constitution.—Three months after the beginning of the civil Government the high commissioner established a nominated advisory council, consisting of ten British officials and ten Palestinians—seven Arabs (four Muslim and three Christian) and three Jews. Later, on the promulgation of the mandate, it was thought advisable to confer upon Palestine a more representative constitution, and an order in council was issued in 1922, providing for the creation of a legislative council consisting of the high commissioner and 22 other members, of whom ten were to be officials and 12 elected. The elected members were to be eight Muslims, two Jews and two Christians. A boycott on the part of the Arab population rendered these and other proposals abortive. Attempts to devise an advisory council were likewise frustrated.

The present system of government is that ordinances are considered first by the high commissioner in executive council, next, after receiving the provisional approval of the colonial secretary, submitted to the advisory council consisting of ten senior officials and then published in the official gazette; but do not, save in rare cases of special urgency, become law until at least one month after publication, so that interests affected may be given the opportunity

[1]For the general atmosphere and "psychology" of these events the reader is referred to the report of the commission of enquiry (Cmd. 1540, 1921).

of expressing their views. This they often do with effect.

Religion.—Complete liberty of religion prevails in Palestine. In certain matters of internal organization, however, action has been taken to assist the communities. A purely Muslim authority has been constituted for the control of Muslim religious endowments (Wakfs) and for appointment of judges in the Muslim religious courts. To this authority, represented by an elected council, the Government has transferred certain wealthy endowments sequestrated 80 years ago by the Turks. The Orthodox patriarchate of Jerusalem, torn by dissensions both between the patriarch and his Synod and with the Orthodox Arab congregation, and crippled by debt, has seen the authority of its patriarch vindicated by a commission of inquiry, and its economic restoration begun by a financial commission, both appointed by the government. The Jewish community had possessed no recognized ecclesiastical organization. The Government assembled in 1921 a conference of leading Jews from all parts of Palestine. Two joint chief rabbis were elected; a rabbinical council was established and officially recognized. The lay community was also organized into central and local councils. Further regulations for the organization of the Jewish community, both religious and lay, and conveying powers of taxation for communal purposes have now been promulgated. In 1924 the French Protectorate of Latin Holy Places was withdrawn by the Vatican.

Justice.—The system of justice originally established by the military administration has been amended where necessary. British judges under a chief justice preside over the two sections of the court of appeal, four district courts and two land courts. All other judges and magistrates are Palestinians drawn impartially from among the qualified members of the three religious communities. Cases of religious law and personal status are still judged as under the Turkish régime by the special tribunal of the several creeds. Ottoman law, amended by ordinances of the administration, remains the foundation of the legal system.

FINANCIAL AND ECONOMIC DEVELOPMENT

In 1923 there was a budgetary deficit of £E.752,000. As a result of drastic economies, the position was retrieved in 1924, and resulted in a surplus of approximately £E.263,000.

Revenue and Expenditure

Year	Revenue	Expenditure	Surplus	Deficit
	£E	£E	£E	£E
1920–1	1,422,208	1,227,056	195,152	..
1921–2	1,997,522	1,881,108	116,414	..
1922–3	1,764,585	1,837,173	..	72,588
1923–4	1,633,893	1,633,227	666	..
1924–5	2,101,072	1,806,660	294,412	..
1925–6	2,739,091	2,040,332	698,659	..
1926–7*	1,728,131	1,875,824	..	147,693

*1927 April–December, 9 months (estimated).

The rate of the tithe has since been reduced from 12½%, the Turkish figure, to 10%, thus relieving the agriculturist at a single step of one-fifth of the weight of the tax. Legislation is now being introduced providing for the commutation of the tithe into a fixed payment over a period of years and for the substitution of the old Turkish house and land (*Werghu*) tax by an urban property tax. Palestine has hitherto had the use, free of payment, of the main line of railway, and of certain other works constructed by the British army for military purposes during the war. In 1927 the Palestine loan of £2,000,000 was approved by parliament and rapidly covered; and a Palestine currency, based on the pound sterling, with 1,000 mils to the Palestinian pound, introduced.

Communications.—There are 400 m. of metalled main roads in Palestine and 440 m. of secondary roads, serving 177 villages, of which 175 m. have been constructed or rebuilt since the establishment of the civil administration. Many hundreds of miles of tracks connecting scattered villages and settlements are used by motor and other wheeled traffic in the dry weather. In 1914 there was only one motor car in Palestine; there were in 1928 over 2,000 including over 900 within the municipal area of Jerusalem. The military railway constructed by the army across the Sinai desert has been brought under the management of the Palestine Railway Department. A train service is efficiently run from Egypt to Haifa, from Jaffa to Jerusalem and from Haifa to Syria and a through train and car service has recently been inaugurated by Constantinople to Calais. Before the war postal services were maintained largely by separate agencies of European Powers; telegraphs were restricted, telephones unknown. There are now frequent daily deliveries of letters; 34 telegraph offices, 50 public telephone exchanges, and trunk lines to all parts of the country; and Egypt answers calls in English, Arabic and Hebrew at any hour of the day and night. Imperial Airways Ltd. opened in 1927 a station at Gaza and in 1928 The Eastern Telegraph Co. laid a cable connecting Palestine with Cyprus.

Public Health.—The Department of Health with the co-operation of voluntary organizations, notably the Rockefeller Foundation, has directed intensive and successful efforts against malaria. The hospitals of the country provide 1,984 beds of which 488 are in British, 360 in French, 107 in German and 90 in Italian mission hospitals, 668 in hospitals maintained by various Jewish organizations and 271 in government and municipal hospitals. The government and municipal hospitals are intended chiefly for the treatment of infectious diseases, and in addition a mental hospital at Bethlehem is maintained by Government. Trachoma affects more than 60% of the population and preventive measures are taken in the schools where some 64,000 children are kept under early treatment or medical observation, while the ophthalmic hospital of the British Order of St. John of Jerusalem plays a chief part in treating the complications and sequelae of the disease. Leprosy is gradually disappearing and there are now only 57 known cases; 27 infant welfare centres have been established, largely by non-official bodies, in 11 towns and a number of villages; 31 nurses and 71 midwives have qualified in the department's training centres and 125 nurses and 31 midwives in voluntary institutions. Anti-rabic, cholera and smallpox vaccines are prepared in the Government laboratories, and quarantine and disinfection of pilgrims returning from Mecca, and of immigrants, is carried out. In 1927 the death rate was 28·01 while the birth rate was 50·35. The infantile mortality was 201·27 per 1,000 births.

Education.—In 1927 there were 835 schools with 67,000 pupils (42,500 boys and 24,500 girls), made up as follows: 315 Government schools (20,000 pupils: 16,500 boys, 3,500 girls), 53 Muslim non-Government schools (4,500 pupils: 3,650 boys, 850 girls), 275 Jewish schools (26,500 pupils: 13,850 boys, 12,650 girls), and 192 Christian schools (16,000 pupils: 8,500 boys, 7,500 girls). The estimated expenditure of the Department of Education for 1928 amounted to £P.143,619 of which £P.22,744 forms grants-in-aid to non-Government schools. The largest educational authority, after the Government, is the Palestine Zionist Executive, the upkeep of whose 191 schools (17,700 pupils) amounts to £P.100,000.

Assistance to Farmers.—The £E.562,000 advanced by the military administration, mostly in small loans on security of land and crops, enabled peasants to buy animals and seed, and in many ways to recover from the devastation of the war. Subsequently a Department of Agriculture and Forests was established, which gives instruction in the villages and promotes the use of improved instruments and methods; it assists the farmer in dealing with animal diseases and plant pests, fumigates his fruit trees if affected by scale, and protects his cattle from imported diseases by quarantine and veterinary control; it has also planted about 1,000,000 trees, and, through its nurseries, has facilitated plantation by others. Altogether, about 5,000,000 timber and fruit trees have been planted in these years in Palestine. A Government Stud Farm has been established at Acre.

Jewish agricultural settlements came into existence during the past half century. Many were formed on uncultivated and unpromising land which has been transformed into flourishing plantations. The settlers have drained swamps, planted eucalyptus and pines, cultivated vine and almond and developed the orange trade of Jaffa.

At the outbreak of war there were 44 settlements of 87,800 ac.; in 1928 there were about 120 covering an area of 250,000 ac. (over 10% of the cultivable area of Palestine) and supporting a

population of about 25,000. Of the older settlements most were founded or largely assisted by Baron Edmond de Rothschild or the Jewish Colonization Association acting as his agent; the later mostly by the Zionist Organization. Largely owing to the lifework of Eliezer Ben Yahuda, a practical visionary of genius, Hebrew is definitely established as the vernacular as well as the literary language of Palestinian Jewry. The revival of Hebrew culture found in 1925 concrete expression in the formal opening by the Earl of Balfour of the Hebrew University upon Mount Scopus. Hardly less remarkable is the development in 18 years of Tel-Aviv from the suburb into the rival of Jaffa with a population of over 35,000.

Natural Resources and Industry.—Before the war, industries were almost non-existent. A few soap and oil factories at Nablus and elsewhere, Baron Edmond de Rothschild's wine factories at Richon-le-Zion and Zikron Jacob, and some hand industries, such as the Bethlehem mother-of-pearl, represented the sum of local manufacture. Largely owing to Jewish enterprise, there are now factories for silicate bricks, vegetable oil, flour, salt, soap, cement, furniture, chocolates, matches and textiles, as well as smaller enterprises, and, despite difficult conditions, an export trade, especially with Egypt, is being built up. An important hydro-electric concession has been granted to Mr. Pinhas Rutenberg (the Palestine Electric Corporation Ltd.) for the utilization of the water power of the upper Jordan and its tributary the Yarmuk. Power is now being supplied by the corporation to Amman and power stations with oil engines have been erected for the supply of electricity at Tel-Aviv, Haifa and Tiberias. Though Haifa has been chosen as the site of the principal harbour, improvements are being carried out at Jaffa, the centre of orange cultivation, and thus of more than half the total export trade of the country. The potash deposits of the Dead sea constitute an important potential source of wealth and in 1927 a concession to exploit them was granted to Major Tulloch and Mr. Noremeysky (a Palestinian). The balance of trade, shown below, is increasingly adverse, equilibrium being hitherto adjusted by immigration, tourists and charity.

	Imports	*Exports*
1922	£E.5,471,667	£E.1,070,171
1923	„ 4,825,185	„ 1,143,234
1924	„ 5,266,349	„ 1,200,812
1925	„ 7,338,491	„ 1,297,559
1926	£P.6,594,098	£P.1,308,342
1927	„ 6,184,454	„ 1,899,759

In the latter half of 1926 and in 1927 Palestine experienced economic depression of steadily increasing gravity, partly due to the drought, for which loans were granted to Beersheba Bedouins, but still more to the attempt to raise prematurely the municipal and general standard of life and with it the volume of immigration, to cope with which Government was compelled to make extensive grants for unemployment relief works. The crisis was most acutely felt at Tel-Aviv, the liabilities of which township exceed £P.250,000 and in the neighbouring colony of Petach Tikveh where, owing to the objection of Jewish workers to the introduction of Arab orange pickers a clash occurred between unemployed and police. All immigration therefore, save for very carefully selected exceptions, was suspended, and there was a good deal of emigration. The fall in revenue showed itself especially in customs and railway receipts. Limited companies (103) have established themselves under the law of Palestine, and 53 foreign companies have registered themselves locally.

Administration.—The military governorships were in 1919 reduced in number from 13 to 7 and subsequently, under the civil administration, to four, later to two district commissionerships, the Jerusalem-Southern (exactly conterminous with the ancient Judea), and the Northern District. In 1926 the Jerusalem-Southern District was abolished and replaced by a Southern District, excluding the capital and its immediate neighbourhood, henceforward reduced to a deputy district commissionership. Transjordan was in 1927 declared, in closer accord with the mandate, and hereditary emirate, under H. H. the Emir Abdalla, with consequent modifications in the position there of the chief British representative. The Druses were expelled from Azrak in Transjordan, which they were using as a base for revolt in Syria. The headquarters of the R.A.F. were in 1927 transferred from Ramleh to Amman.

In 1927 the first municipal elections since the occupation were held throughout Palestine.

A severe earthquake occurred about 3 P.M. on July 11, 1927, of which the damage was principally felt at Nablus, Ramleh, Lydda and Salt. In Palestine 137 persons were killed and 160 seriously injured, and in Transjordan 64 and 102 respectively. In Jerusalem only one life was lost. Little damage was done to historic buildings: the Dome of the Rock was unaffected, but the small dome of the Holy Sepulchre was badly cracked, and is being reconstructed (1928) by Government, without prejudice to the ultimate allocation of charges, under the *status quo* of the Holy Places. The Government erected temporary hutments for the homeless at Nablus, Ramleh and Lydda and set in motion a credit scheme to assist house-owners to rebuild their premises. Further slight shocks were felt in Feb. 1928. (R. STO.)

THE HOLY PLACES

To the vast majority of Jews, Muslims and Christians, the religious associations of Palestine predominate over every other, and at all ages have attracted pilgrims to its shrines. We need allude only to the centralization of Jewish ideas and aspirations in Jerusalem, especially in the holy rock on which tradition (and probably textual corruption) have placed the scene of Abraham's sacrifice of Isaac, and over which the Most Holy Place of the Temple stood. The same associations are those of the Muslim, whose religion has absorbed so much of Judaism. The mosque of Omar which is built on the site of the Temple is one of the glories of Islam; the alleged tomb of Moses and the mosque at Hebron over the cave of Machpelah are famous centres of Muslim pilgrimage. Christianity, however, is responsible for the greatest development of the cult of holy places in Palestine.

There is no evidence that the earliest Christians were interested in the sites associated with the life and teaching of Jesus Christ. These were of no special moment to them in comparison with the all-important fact that "Christ was risen." It was not till the clear-cut impress of the events of Christ's life had faded from human recollection that there arose a desire to "seek the living among the dead." The story begins with Helena, mother of Constantine the Great, who became fired with zeal to fix definitely the spots where the great events in the birth of Christianity had taken place and in 326 visited Palestine for that purpose. Her pilgrimage, as might have been expected, was attended with complete success. The True Cross was discovered; and, by excavation conducted under Constantine's auspices, the Holy Sepulchre, "contrary to all expectation" as Eusebius naively says, was also found (*see* JERUSALEM and SEPULCHRE, THE HOLY). The stream of pilgrimage to the Holy Land began immediately, and has flowed ever since. Onwards from 333 when an anonymous pilgrim from Bordeaux visited the holy places and left a succinct account of his route and of the sights he saw, there is a continuous record of the experiences of a multitude of pilgrims. It is a pathetic record. No site, no legend, is too impossible for the unquestioning faith of these simple-minded men and women. By comparing one record with another, we can follow the multiplication of "holy places," and sometimes can even see them being shifted from one spot to another, as the centuries pass. Not one of these devout souls had any shadow of suspicion that, except natural features (such as the Mount of Olives, the Jordan, Ebal, etc.) and possibly a few individual sites (such as Jacob's well at Shechem) there was not a single spot in the whole system that could show the flimsiest evidence of authenticity.

The growth and development of "holy sites" can best be illustrated by figures. The account of the "holy places" seen in Palestine by the Bordeaux pilgrim in the 4th century of our era occupies 12 pages in the translation of the *Palestine Pilgrims' Text Society* and these 12 pages may be reduced to seven or eight as they are printed with wide margins and have many footnotes added. On the other hand the experiences and observations of Felix Fabri, a Dominican monk who visited the country about 1480, occupy in the same series two large volumes of over

600 pages each. The comparison is made in full realization of the fact that the Bordeaux record is a dry catalogue while Fabri's work is enlarged by much delightful gossip. The "invention" of sites has continued to our own times. In the so-called "Via Dolorosa" is a cave which was opened and surveyed in 1870. It became closed and forgotten; houses covered its entrance. In 1906 it was reopened, the houses were cleared away and a hospice for Greek pilgrims erected in their stead. During these works some local archaeologists attempted to penetrate the cave but were expelled with curses by the labourers. At last the hospice was finished and the cave opened for inspection. A pair of stocks was then shown cut in the rock where none appeared in the plan of 1870; a crude painting was suspended on the wall above, blasphemously representing the Messiah confined in them.

The Franciscans were nominated custodians of the Holy Places by Pope Gregory IX. in 1230. Certain sites have, however, always been held by the Oriental sects and since 1808, when the church of the Holy Sepulchre was burnt down, the number of these has greatly increased. The 19th century was disgraced, in Palestine, by a feverish "scramble" for sacred sites, in which the most dishonest means were employed and the ethics of Christianity forgotten in the struggle to oust rival orders or sects. Churches, chapels and monasteries, most of them in the worst architectural taste, sprang up like mushrooms throughout the country to perpetuate the memory of pseudo-sanctuaries which were best forgotten. The zeal and self-sacrificing devotion displayed by many of their inmates and their noble labours on behalf of the people and history of Palestine throw into yet more painful relief the actions and mental attitude of some of their co-religionists.

The authenticity of the "Holy Places" was first attacked seriously in the 18th century by Korte, a bookseller of Altona; since he led the way a steady fire of criticism has been poured upon this mass of invention. The process of manufacture continued unchecked until the World War. Even the Protestant churches are not exempt from blame; a small tomb near the Damascus Gate of Jerusalem was fixed upon by certain English enthusiasts as the true "Holy Sepulchre," an identification for which there is nothing to be said. Since the World War speculations founded on a basis of false philology and highly conjectural exegesis, such as the belief in the identity of the "Anglo-Saxons" with the ten lost tribes of Israel and in the prophetic intention of the builders of the Great Pyramid, have occupied minds that might otherwise have made further "discoveries" in the Holy Land.

FOREIGN SETTLEMENT

Down to the time of the Egyptian occupation the only foreigners permanently resident in Turkish Palestine were the members of various monastic orders and a few traders. The first Protestant missionaries settled in Jerusalem in 1823; they founded the trade in olive-wood articles for the support of their converts. In 1849 came the first of several examples that have appeared in Palestine of that curious product of American religious life—a community of dupes or visionaries led by a prophet or prophetess with claims to divine guidance The leader in this case was one Mrs. Minor, who came to prepare the land for the expected Second Advent. Her followers quarrelled and separated in 1853. This event is of importance, as it had much to do with the remarkable development of Jewish colonization of Palestine in the last 30 years of the 19th century. Mrs. Minor, who was interested in the Jewish people, was befriended by Sir Moses Montefiore; after her death her property was placed in charge of a Jew and finally passed into the hands of the *Alliance Israélite Universelle*. In 1870 this body founded an agricultural colony for Jews on the road from Jaffa to Jerusalem, and called it "Mikweh Israel." Another visionary American colony the "Adamsites" came in 1866 but lost heart and departed, after selling their property to a German community, the *Tempelgemeinde*, a Unitarian sect led by Messrs. Hoffmann and Hardegg who established themselves in Jaffa in 1868. Unlike the Americans, these hardy Württemberg peasants have flourished in Palestine and their colonies at Jerusalem, Haifa and in the Jaffa district have prospered and remain prosperous. In 1921 the return of the men of military age of the Haifa colony who had been temporarily deported as a military measure after the war, caused the greatest satisfaction among their late enemies, the British officers and officials stationed there, who congratulated themselves on the return of the "only efficient craftsmen" in the town. Another American religious colony, known after the founder as the "Spaffordites" was more successful, if less numerous than its predecessors and some of its members have played a considerable part in the social and commercial life of Jerusalem.

Jewish immigration took three forms: agricultural colonization under the auspices of Zionism (*q.v.*); the influx of needy Jews of the "haluka" (dole) who abused Hebrew charity and swelled the number of Palestinian Jews who lived or existed on remittances from Jewish congregations and philanthropists in Europe and America; the settlement by small numbers of middle-class Jews possessed of some capital who came to live out their lives in congenial surroundings. By 1914 there were over 60,000 Jews in Palestine of whom about a fifth were settled in agricultural colonies. Of the immigrants the majority came from Russia during the anti-Jewish disturbances of 1878–81.

EXPLORATION

Before the 19th century local anarchy made exploration difficult or impossible. Scientific exploration, as distinguished from the sometimes valuable narratives of early pilgrims and secular travellers, begins with Edward Robinson, an American clergyman, who made a series of journeys through the country and published his itineraries and observations under the title of *Biblical Researches in Palestine* (1841–56). Though marred by the hastiness of his visits and the consequent superficiality of his descriptions of sites and by some untenable identifications, his work is at once the standard and the foundation of all subsequent topographical work in the country. He was worthily followed by Titus Tobler, who in 1853 and later years published volumes abounding in exact observation, and by V. Guérin, whose *Description géographique, historique, et archéologique de la Palestine*, in 7 volumes (1868–80), contains a wealth of material collected in personal travel throughout Palestine.

In 1864 was founded the Palestine Exploration Fund, under the auspices of which an ordnance survey map of the country was published in 1881, accompanied by volumes dealing with the topography, orography, hydrography, archaeology, zoology and botany of the Holy Land. The same society initiated the scientific exploration of the mounds of Palestine. The example thus set was followed by French, German and American explorers. The Deutscher Palästina-Verein founded in 1878 carried out important surveys and excavations. Austrian explorers, notably Dr. E. Sellin did valuable independent work. A remarkable biblical and archaeological school under the control of the Dominican order was founded at Jerusalem, and German and American archaeological institutions, educational in their purpose, were also established there. Valuable archaeological exploration was annually carried out by the directors of these schools and their pupils. An account of some of the discoveries made by these bodies will be found under the Archaeology section of this article (*see* also ARCHAEOLOGY: *Palestine and Syria*) while the geographical and archaeological explorations of Dr. Alois Musil and Brunnow in Moab and Nabataea are referred to under TRANSJORDAN (*see* also MOAB; PETRA). Useful topographical and archaeological reconnaissances of the country on both sides of the Turco-Egyptian border were carried out by Major S. Newcombe, T. E. Lawrence (*q.v.*) and C. L. Woolley very shortly before the World War.

(R. A. S. M.)

In 1918 the military governor of Jerusalem, in order to preserve the antiquities of the district, issued and enforced certain public orders; and, to organize public opinion, established the Pro-Jerusalem Society, an international and non-sectarian body, in which all communities and most learned societies participated through their leading members. The society encouraged arts and crafts, employed a qualified architect and town planner to protect the amenities of the old and advise on the development of the new city, and collected in subscriptions some £E.15,000. It was dissolved in 1926, having distributed most of its duties and activ-

ities between the Department of Antiquities and the municipality of Jerusalem. The former was established in 1920; 2,860 historical sites have been registered by it and are being inspected, and in 1927 the Rockefeller Foundation granted to Palestine $1,000,000 for the erection and endowment of an archaeological museum.

Tristram, *Land of Israel* (1865); The Palestine Exploration Fund *Map* and companion volumes; C. Baedeker, *Guide Book* (1906) is most useful to the average reader. G. A. Smith, *Historical Geography of the Holy Land;* V. Guérin, *Description géographique, historique et archéologique de la Palestine* (1868–80).

Antiquities.—Much material is available in the *Quarterly Statement* and other publications of the Palestine Exploration Fund (from 1869), *Zeitschrift des Deutschen Palästina-Vereins* (from 1878), *Revue Biblique* (from 1892), *Revue de l'Orient Latin* (from 1893), *Mitteilungen der vorderasiatischen Gesellschaft* (from 1897) and *Recueil d'archéologie orientale* (Clermont-Ganneau, from 1885). The exploration of sites has given rise to much literature; *cf.* W. M. F. Petrie, *Tell-el-Hesy* (1891), F. J. Bliss, *A Mound of Many Cities* (1894) and F. J. Bliss and R. A. S. Macalister, *Excavations in Palestine 1898–1900* (1902). The bearing of recent archaeological discovery on the authenticity of Hebrew record is discussed by H. Vincent, *Canaan d'après l'exploration récente* (1907); S. R. Driver, *Modern Research as Illustrating the Bible* (1909), and many others.

Early pilgrims and geographers.—P. Geyer, *Itinera hierosolymitana saec. iv.–viii.* (1898) and in the publications of the Société de l'Orient Latin and of the Palestine Pilgrims Text Society.

Natural History.—H. B. Tristram, *Natural History of the Bible* (1867) is still useful; G. E. Post, *Flora of Syria, Palestine and Sinai* is far the best botanical study of the area.

PALESTINE, a city of eastern Texas, U.S.A., 120 m. S.E. of Dallas, between the Trinity and the Neches rivers; the county seat of Anderson county. It is served by the Missouri Pacific and the Southern Pacific railway systems. The population was 11,039 in 1920 (26·5% negroes) and was estimated locally at 16,000 in 1928. It is the trade centre of a very fertile region, highly cultivated along the watercourses and elsewhere heavily timbered with hardwood and pine, containing great deposits of lignite and many salt domes which are expected to yield oil. The Boggy Creek Field, with four producing wells, is 16 m. E. of the city. Seven miles W. is one of the largest salt-works in the United States, pumping brine from wells 190–220 ft. deep, and a lignite mine is in operation in the same region. The International-Great Northern railroad has its main shops at Palestine, with a total annual pay-roll of $3,000,000. Lumber, furniture, fixtures, baskets, boxes, crates, and mattresses are leading products. A settlement was made and a stockade built (Ft. Houston) 2 m. S. of Palestine in 1837. Palestine was laid out as the county seat in 1846, and was named after Palestine, Arkansas, the home of the first settler. The city was chartered in 1871. Since 1909 it has had a commission form of government.

PALESTINE, OPERATIONS IN. The British campaigns of 1914–18 in Palestine, Egypt and Syria covered an extensive stretch of territory, from the Suez Canal to Aleppo, a distance by the land route of well over 500 miles. This land route, the oldest highway in the history of the civilized world, along which the tides of thought and trade and war have flowed between Asia and Africa since time immemorial, traverses a remarkable variety of soil and scenery: the inhospitable desert of Sinai; the fertile plains of Palestine, flanked by the high rocky citadel of the Judaean hills; the deep trench of the Jordan valley; and, finally, the Syrian plateau with those cities of ancient tale, Damascus and Aleppo.

The fighting was as diversified as the terrain; it comprised battles in the desert and in fertile country, combats in steep bleak hills and in a sweltering valley below sea level, periods of close-locked siege warfare and intervals of rapid movement. The story of the successive advances of the Egyptian Expeditionary Force (as the British army in this theatre came to be called) and of the gradual extension of its objective—from the passive defence of the canal to the delivery of the *coup de grâce* to the Turkish empire—falls conveniently under four main heads: the Suez canal, Sinai, Palestine, Syria.

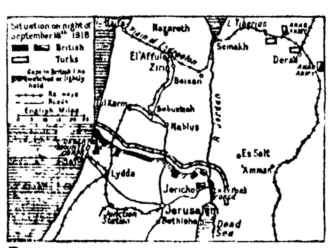
I. THE PROBLEM OF THE SUEZ CANAL

When Turkey entered the World War on the side of the Central Powers at the beginning of Nov. 1914, it was obvious that an advance from southern Palestine against the Suez canal and Egypt was likely to form part of the Turkish strategical programme, largely inspired from Berlin. Seizure of the canal would paralyse the most vital line of communication with the British Empire and seriously hamper the gathering of its armies. Even the threat must immobilize considerable numbers for passive defence. The dream of reasserting dominion over their former province of Egypt was an additional lure to the Turks.

The Turkish Advance.—Between the southern frontier of Palestine and the Suez canal lay over 100m. of almost waterless desert. It was crossed by three routes, of which the northern, near the coast, through Rafah, El 'Arish and Qatiya to El Qantara, was the easiest and best. The Turks made their main effort on the centre route, from El 'Auja by the Wadi Muksheib, which reaches the canal about Tussum, south of Ismailia; but they also sent smaller forces by the coast road and by the southern route through Nekhl to Suez, the most difficult of the three. The Turkish commander in Syria, Jemal Pasha, directed the enterprise, but its real brain was his Bavarian chief of staff, Col. Kress von Kressenstein. In spite of the difficulties, a force of some 12,000 to 15,000 Turks was brought within striking distance of the canal by the first days of Feb. 1915.

The British were not unaware of the danger—though they underestimated the Turkish effort—and were ready. The line of defence, which was held mainly by Indian troops, lay on the western bank of the canal, leaving the canal itself as an obstacle between the defenders and the enemy. A territorial division (the 42nd) and some Australian and New Zealand troops, who were completing their training near Cairo, formed the reserve. Warships in the canal provided gun support and compensated for the scarcity of land artillery. On the night of Feb. 2–3 the Turks made their effort, reached the canal, and actually succeeded in pushing three pontoons full of troops across it. These were all killed or captured. An attack next day had no better success, and the Turks withdrew, unmolested by any serious pursuit.

This first Turkish raid, though it failed, proved the desert passable to large bodies of troops and thus compelled the retention of considerable forces in Egypt for the protection of the canal. It also showed the unsuitability of the defence on the west bank, since this line could not prevent the attackers from reaching the canal and interfering with the passage of shipping. No change was made in the system of defence, however, till after Lord Kitchener's visit in Nov. 1915. For during the summer and autumn of 1915 the Gallipoli campaign was in full swing and absorbed the principal efforts of both Turk and Briton. The Senussi rising in the western desert, too, occupied the attention of the G.O.C. in Egypt, Gen. Sir John Maxwell. After the evacuation of Gallipoli at the end of 1915 and beginning of 1916 Egypt contained close on 400,000 British troops, reorganizing and recuperating after that gallant but ill-starred adventure. For a short time there existed within Egypt three separate, independent commands, but in March 1916 all three were united under Sir Archibald Murray.



PLAN OF OPERATIONS IN PALESTINE, SEPTEMBER 18TH, 1918

Meanwhile, early in 1916, a line was taken up in the desert, some 8 to 10m. to the east of the canal. Many miles of entrenchments were dug and reveted in the shifting sand, metalled roads constructed and pipe lines laid. For the Turk, freed from concern for the safety of his capital, was obviously contemplating a fresh advance on Egypt and the canal. He had in fact been busy with preparations ever since the repulse of his first effort.

This system of entrenchments, extending for some 80m. along practically the whole length of the canal, was expensive in men

as well as in material. This fact originated the first advance of the Egyptian Expeditionary Force and led to the crossing of the Sinai desert, an achievement made possible by sound and thorough organization, and by the fine quality of the mounted troops, mainly Australians and New Zealanders.

II. THE SINAI DESERT

Sir Archibald Murray's objective was to secure control of the Sinai desert, which he saw could be effected by an advance to El 'Arish near the Egyptian frontier. A position here would bar the northern route across the desert and flank the more southerly routes. It would also enable offensive operations to be undertaken against enemy forces concentrating in southern Palestine. But an invasion of Palestine was not seriously contemplated at this time; the advance was initiated to safeguard Egypt and the Suez canal. Murray estimated the force necessary at five divisions and four mounted brigades, a much smaller force than that needed adequately to garrison the defensive system along the canal. Moreover, the farther the defence was removed from Egypt the less chance there was of a sympathetic rising there.

British Advance on El 'Arish.—The first step was to occupy the Qatiya oasis, 25m. east of the canal, and thus deny to the enemy the only district within striking distance where a sufficiency of water permitted the assembly of a large force. The construction of a broad gauge railway from El Qantara towards Qatiya was begun, and large numbers of camels were collected to form the transport of the force, since in the soft sand of the desert wheeled transport was impossible. For the guns, special "pedrails" were constructed and teams doubled. Towards the end of April 1916 the Turks made a raid on the Qatiya oasis and surprised and captured some advanced posts of yeomanry. The Anzac Mounted Division, formed in March from Australian and New Zealand troops reoccupied the area next day. The object of the Turkish raid seems to have been to cause alarm and thus to prevent the further withdrawal of troops from Egypt for France, which had been going on during the spring of 1916.

By July the advance had reached Romani at the western end of a scattered group of oases extending for some 15 to 20m., when a strong Turkish force entered the eastern end. This force consisted of the 3rd Division and certain other units, totalling about 18,000 men under Kress von Kressenstein. After a pause for preparation, at dawn on Aug. 4, it attacked the British position at Romani, held by the 52nd and 42nd Divisions, the Anzac Mounted Division and some yeomanry, in all about 30,000 men, under Lt.-Gen. the Hon. H. A. Lawrence. The Turks made a determined assault but were heavily repulsed and pursued as far as Bir el Abd. Their losses, including some 4,000 prisoners, amounted to nearly half their total force. They may perhaps be accounted fortunate to have escaped at all, for intense heat and lack of water precluded the more vigorous action in pursuit, which might have made possible the annihilation of the Turkish force.

The defeated Turks retreated to El 'Arish, leaving a small detachment at Bir el Mazar till the middle of September, when it was dislodged by the Anzac Mounted Division. There was no further fighting till December. The progress of the British force (now under Lt.-Gen. Sir Charles Dobell) towards El 'Arish was governed by the rate (about 20m. a month) at which the railway and its accompanying pipe-line could be laid. The water supply available in Sinai was too brackish for constant drinking by troops; even the railway locomotives could not use it for long without loss of efficiency. The Sweetwater canal, which runs from the Nile at Cairo to the Suez canal, was the source of the pipe-line supply; from large reservoirs and a great pumping station built at El Qantara it was forced through a 12-in. pipe to railhead. In 1917 this pipe-line was extended up to Gaza.

Occupation of El 'Arish and Rafah.—Early in December the railhead was within 20m. of El 'Arish. Elaborate water and transport arrangements were now made to enable the advanced guard of the British force to capture El 'Arish. This advanced guard was known as the Desert Column, and consisted at this time of the Anzac Mounted Division and 42nd and 52nd Divisions, under Lt.-Gen. Sir Philip Chetwode. Just as all was ready the enemy withdrew and El 'Arish was occupied Dec. 20.

The nearest Turkish force (1,600 infantry with four guns) was located at Magdhaba, some 20m. south of El 'Arish. A flying column under Gen. Chauvel, consisting of the Anzac Division and Imperial Camel Corps, was at once despatched against it. After a night march Chauvel attacked the Turks in an entrenched position at dawn on Dec. 23. By late afternoon, at a cost of under 150 casualties, he had accounted for practically the whole enemy force, capturing 1,300 prisoners and burying 100 dead. Only 200 Turks survived the engagement.

The only Turkish force now remaining within the Egyptian frontier was a detachment of about 2,000 near Rafah, 25m. east of El 'Arish. This was dealt with in a similar fashion by the mounted troops under Chetwode. After a night march, he surrounded the Turkish position at dawn on Jan. 9. Some hard fighting followed, for the Turks were in a strong position and put up a stout defence. It was not till close on dark that the position was assaulted. The entire Turkish force was accounted for, while the British casualties were under 500. These two brilliant actions cleared the Egyptian province of Sinai from enemy occupation. They were striking examples of the power of boldly handled mounted troops, a power the Turk was to experience very thoroughly before the end of the World War. Murray had now obtained his original objective, since the possession of Rafah and El 'Arish secured the safety of the Suez canal and Egypt.

Towards the end of 1916 he had, however, received instructions which imposed on him a more active rôle than the mere defence of Egypt. While this defence was still to be the main consideration, it was made clear to him that the war cabinet expected some more spectacular result of the "Exodus" across the desert than the negative one of giving checkmate to Turkish designs on Egypt. At the same time they were not prepared to give Murray the additional troops he asked for. Indeed, one of his four divisions, the 42nd, was early in 1917 withdrawn to France, leaving him only three in place of the five which he held to be the minimum to fulfil the rôle demanded of him. He had the nucleus of a fourth division—the 74th—to be formed from dismounted yeomanry; and the liquidation of the western campaign enabled him to add a second mounted division to the force on the Palestine border.

The situation in the early spring of 1917 was this: railhead was close to the Egyptian frontier at Rafa, some 20m. from Gaza; the British war cabinet's policy for the Egyptian theatre had finally crystallized into instructions to Sir Archibald Murray to prepare during the summer for an offensive campaign into Palestine in the autumn; and the Turk—now definitely on the defensive—had suddenly evacuated a forward position which he had prepared at Shellal, and had sketched out a position for the defence of Palestine between Gaza and Beersheba.

The Palestine Offensive.—Gaza and Beersheba, some 25m. apart, are the two natural gates into Palestine from the south, the former by reason of its commanding position on the coast road, the latter as the last water base on the confines of the mountainous desert to east and south. Between Gaza and Beersheba, in an almost direct line, runs a series of ridges which form a natural defensive position. Murray saw that in order to carry out his instructions to prepare for an autumn offensive, it was desirable to push his railhead forward out of the desert up to the cultivated plain of south Palestine. The conditions of transport would then be entirely different and camels could be largely replaced by wheeled transport. Moreover, the capture of Gaza would make it impossible for the Turk to hold the Gaza-Beersheba line as his main defensive position.

It was decided therefore in March to attempt the capture of Gaza by a *coup de main* similar to those at Rafah and Magdhaba, but on a much larger scale. The difficulties of concentration, of supply and of secrecy were of course much increased by the necessity to employ infantry in addition to mounted troops. The Turks had at the time some 7,000 fighting troops in Gaza, another 7,000 at Tel esh Sheri'a, half-way between Gaza and Beersheba, and a small garrison in Beersheba.

The plan was, briefly, for the mounted troops to pass east of Gaza, cut the garrison's line of retreat, and hold off the arrival of

any Turkish reinforcements from the north or east. The 53rd Division was to assault the heights east and south of Gaza, while the 54th Division protected the exposed right flank from the direction of Tel esh Sheri'a.

Attacks on Gaza.—The enterprise took place on March 26. Unfortunately, a dense sea fog came up with the dawn and caused a delay of two precious hours in the deployment of the infantry. This delay, which could not have been foreseen nor prevented, was the direct cause of the loss of the battle. For the Turkish position was strong, and it was not till 5 P.M. that the 53rd Division secured the 'Ali el Muntar ridge which dominates Gaza from the east; at the same time, a part of the mounted troops were in the north-eastern outskirts of the town. The victory was to all appearances won. In fact the garrison, as was afterwards known, was on the point of surrender. But Turkish reinforcements from the north and east were already pressing on the protective screen of the mounted troops; the horses were without water, and darkness was coming on. It had been agreed beforehand that the enterprise should be abandoned if Gaza had not fallen by dark. The reports received did not indicate a successful issue; owing to a breakdown of communications, news of the success of the 53rd Division did not reach the British commander till about 11 P.M. Sir Charles Dobell hesitated to involve his infantry in the intricate network of cactus hedges which surrounds Gaza, while Chetwode was against exposing his mounted troops, exhausted by want of water, to the danger of being overwhelmed by the approaching Turkish reinforcements. The withdrawal of the mounted troops was ordered. This exposed the right of the 53rd Division, which had to be drawn back from the 'Ali el Muntar heights to gain touch with the left of the 54th. The battle was resumed next morning, but the Turkish garrison had been reinforced and had taken heart of grace at the unexpected respite of the previous evening. It was found impossible again to make good the 'Ali el Muntar ridge, the key to Gaza; and finally the whole force was withdrawn to the Wadi Ghazze.

This first battle of Gaza has been a matter of dispute and conjecture. By many of the troops who took part, it was held that the decision to withdraw threw away a victory already won. On the other hand, it is impossible to question that in the circumstances the order for retirement was justified. The two-hour delay in the morning lost the battle. Other contributory causes were the breakdown of communications (partly due to shortness of equipment) and lack of accurate maps, which made it impossible for H.Q. to obtain timely information of the progress of the fight.

Though the enterprise had failed, the force had secured a position on the Wadi Ghazze which would enable railhead to be advanced to within a short distance of Gaza in preparation for the autumn campaign. Murray now, however, received instructions to commence an offensive movement at once. A fresh assault on Gaza was therefore prepared. But the conditions were now very different; the Turk had closed the gap between Gaza and Beersheba by a series of works, and had greatly extended and strengthened the defences of Gaza. He had some five divisions in line and a considerable quantity of heavy artillery, so that Gen. Dobell's force had no easy task. Much hope was placed in some tanks, which were to be used in Eastern warfare for the first time. The attack was made in two stages, of which the first, on April 17, was designed to gain a position from which the final thrust on Gaza could be made. It was successful. But the decisive attack on April 19 failed with heavy loss; the tanks developed mechanical defects in the heavy sand or were put out of action by the well-placed Turkish guns; and the weight of artillery supporting the British attack was insufficient to demolish the formidable defences of Gaza. The British casualties were 7,000.

Operations before Gaza now settled into regular trench warfare. The Sinai campaign was at an end. It had fulfilled its object: the security of Egypt; and the careful and thorough organization which had conquered the desert had laid a solid foundation for the future British successes. For this Sir Archibald Murray deserves the greatest credit. He had never been given the number of troops necessary for more extended successes.

III. PALESTINE

A long pause in active operations followed the second battle of Gaza. The Turks, under German leadership, were now gathering their last resources at Aleppo for an attempt to recapture Baghdad. They christened this force the "Yilderim" ("lightning") group. The British General Staff decided to forestall this enterprise by an attack in Palestine which would divert this army southwards from Aleppo and remove the danger to Baghdad. The British Government also no doubt hoped by a spectacular success in the East to remove some of the disappointment caused to the public by the failure of Nivelle's offensive in France and the military collapse of Russia. Gen. Sir Edmund Allenby succeeded Sir Archibald Murray in July 1917, with instructions to report on the conditions in which offensive operations could be undertaken against the Turkish forces on the Palestine front.

Allenby's Plan Outlined.—Allenby based his plan on an appreciation made some time previously by Lt.-Gen. Sir Philip Chetwode, who now commanded on the Gaza front. The obvious line of advance was by Gaza, which would allow of naval co-operation, directly cover the lines of communication, and present comparatively small difficulties of water supply. But the defences of Gaza were too solid to be broken except by a slow and costly process of siege. The Turkish centre was also strong and the approach to it difficult. There remained the Turkish left, which rested about Abu Hureira, some 7m. west of Beersheba; the defences here were weaker and less complete, and might perhaps be rapidly overwhelmed. This would provide an opportunity for the mounted troops, the arm in which lay the chief superiority of the British force over the Turkish.

A preliminary operation was necessary to capture Beersheba, which the Turks held by a detached force; for there was not room to manoeuvre between Beersheba and the Turkish left; moreover, possession of the water supply at Beersheba was essential to further operations. The difficulties of capturing Beersheba and of placing a sufficient force within striking distance of the Turkish left were, however, serious. The three principal problems to be solved were those of transport, water supply and secrecy. Until the Gaza-Beersheba line had been passed and the cultivated plain of Palestine reached, it was not practicable to use motor lorries, and the force was dependent on horse transport and camels. This limitation greatly increased the difficulties of water supply, which was the second main problem. Its seriousness is illustrated by the fact that the striking force estimated as necessary for operations against the Turkish left required some 400,000gal. of water daily. Of the 30,000 camels available the majority would be required to carry water. The third great difficulty was to concentrate a striking force sufficient to overwhelm the garrison of Beersheba rapidly and then attack the Turkish left, without the Turks becoming aware and taking steps to counter or avoid the blow.

In spite of the difficulties to be overcome, Gen. Allenby decided to attack the Turkish left. He estimated the total force required at seven divisions and three mounted divisions with additional artillery and aeroplanes. Four divisions and two mounted divisions were to attack the Turkish left, three divisions were to make a subsidiary attack on Gaza, and one mounted division was to watch the centre between these two wings, which would be separated by some 20m. during the operations.

The number of divisions was made up to the required total by the 10th and 60th from Salonika and by the completion of the 75th, already in process of formation. Allenby formed his three mounted divisions into the Desert Mounted Corps, under Lt.-Gen. Sir H. Chauvel, an Australian, and his seven divisions into two corps, the 20th, under Lt.-Gen. Sir Philip Chetwode, and the 21st, under Lt.-Gen. Sir E. Bulfin. The elaborate preparations necessitated by the character of the forthcoming operations occupied the summer and early autumn. The railway across the desert was doubled and arrangements were made for its rapid extension during operations; ammunition and other stores were accumulated and the troops underwent special and intensive training. The development of the water supply was also a constant preoccupation.

Meanwhile, Gen. von Falkenhayn, in command of the Turkish

army at Aleppo, had realised that the security of the Palestine front was essential to the successful prosecution of the plan for the recapture of Baghdad. It was accordingly decided to drive the British back into the Sinai desert before committing the Yilderim force to the Mesopotamian adventure. All troops available at Aleppo (only three divisions) were ordered to south Palestine during September.

Both Turks and British were thus aiming to strike a blow on the Palestine front in the autumn of 1917, and each hoped to forestall the other. The poverty of the Turkish lines of communication decided this issue by the delay it imposed on the southward movement of men and stores From Haidar Pasha, the Turkish main base on the Asiatic shore of the Bosporus, to railhead in Palestine was a distance of 1,275m., with a single line of rail only, which, up to Aleppo, had also to serve the Mesopotamian front. The incomplete tunnels in the Taurus and the differences in gauge of the various lines necessitated five or six transhipments of all stores before they reached Palestine Scarcity of fuel and jealousies between the German commanders and staff and the Turkish officials who controlled the working of the communications further accentuated the difficulties. Consequently, the supply problem crippled Turkish movements throughout these campaigns. The force from Aleppo was still in process of arrival on the Palestine front when Allenby struck his blow

Disposition of the Troops.—During the days previous to Oct. 31, the date fixed by Allenby for the attack on Beersheba, the Desert Mounted Corps and the 20th Corps (10th, 53rd, 60th, 74th Divisions) were gradually and secretly moved across to the right wing from behind Gaza, where they had been in training camps by the sea. There could be no question of concealing entirely the preparations for a movement against Beersheba; but Allenby did hope to persuade the Turks that this movement was only a feint and that the real main attack was against Gaza To this end the 21st Corps (52nd, 54th and 75th Divisions), left opposite Gaza, began on Oct 26 a heavy bombardment of the Turkish defences, assisted by British and French warships from the sea The intended deception as to the real point of attack was aided by the natural nervousness of the Turk of operations by sea against his right flank. He was also aware of the great difficulties of transport and water supply in the country opposite his left flank, which he believed was sufficiently safeguarded by these natural obstacles.

The Turkish forces at the end of Oct consisted of the 8th Army (six divisions) under Kress von Kressenstein, holding Gaza and the Turkish centre, and the 7th Army (three divisions), holding Beersheba and the Turkish left The 7th Army was not yet complete, one of the divisions from Aleppo being still on the lines of communication. Falkenhayn, who was to combine the action of these two armies, only arrived at Jerusalem on Nov 1 The approximate fighting strengths of the Turkish and British forces were: Turks, 50,000 rifles, 1,500 sabres, 300 guns; British, 95,000 rifles, 20,000 sabres, 500 guns

Allenby's plan for Oct. 31 was as follows: Two divisions of the 20th Corps, the 60th and 74th, were to attack the south-western defences of Beersheba, which lay some 4m from the town itself, with the 53rd Division protecting the left flank of this attack The Anzac and Australian Mounted Divisions, which had concentrated at El Khelasa and Bir 'Aslūj, were to reach a position east of Beersheba by dawn, close the Beersheba-Hebron road, and then attack and carry the town as rapidly as possible, before the Turks could destroy the wells.

Capture of Beersheba.—During the night of Oct. 30–31 the assaulting infantry and artillery moved some 8m. to their positions of deployment, while the mounted troops undertook a ride of over 25m. to reach a position east of Beersheba These long and complicated night movements were only made possible by careful preparation and good staff work. At dawn on Oct. 31 the attack of the 20th Corps commenced. A Turkish forward work, Hill 1030, had to be taken, to allow the artillery to get within wire-cutting range of the main position. Hill 1030 was taken at 8.30 A.M.; the main assault was delivered at 12.15 P.M. and was successful; by early afternoon the British infantry were masters of the Turkish defences south-west of the town; they were still, however, some miles from the town itself. Meanwhile, the mounted troops, after closing the Hebron road, had been held up by a Turkish strong point at Tel es Saba, 3m. east of Beersheba When this was at last taken, little time remained if the town was to be captured before dark. Gen. Chauvel accordingly ordered a mounted attack at 4 P.M. The 12th Australian Light Horse Brigade charged over the Turkish trenches and rode straight into the town. This daring and well-executed charge resulted in the capture of over 1,100 prisoners and 10 guns, and saved the all-important wells from demolition. The infantry had captured another 900 prisoners, and the Turkish 27th Division had suffered practical annihilation. While the preparations for the decisive attack on the Turkish left were being made, the 21st Corps carried out a holding attack at Gaza on the night of Nov. 1–2 A considerable portion of the Gaza defences was carried and heavy losses caused to the Turks

Left to themselves, the Turkish commanders would now probably have retired to a fresh position while there was yet time But Falkenhayn, imbued with German principles of defence and ignorant of the qualities of the Turkish troops he led, ordered a counter-attack with all available reserves to the north of Beersheba. This led to three days' heavy fighting against the British 53rd Division, which had been sent into the hills to guard the right flank of the 20th Corps. The 53rd Division held its own; consequently, when at dawn on Nov. 6 the remainder of the 20th Corps (10th, 60th and 74th Divisions) attacked and broke through at Abu Hureira, the Turks had no reserves to restore the situation By nightfall Gaza was being evacuated and the whole Turkish force was in full retreat

The pursuit by Allenby's mounted troops was hampered by lack of water, and the Turkish rear-guards were well handled A gallant charge at Huj on Nov 8 by some squadrons of Worcestershire and Warwickshire Yeomanry captured three batteries of guns; but no large bodies of Turks were cut off, and the supply question limited the number of divisions which could be used in the pursuit

On Nov. 11 the Turks took up a position to cover Junction Station, where the railway to Jerusalem branches off the main line. After a short pause to organize for attack, Allenby's pursuing troops attacked on Nov 13 and soon dislodged their enemy, in an action remarkable mainly for a dashing charge by a brigade of yeomanry on a strongly held hill above the village of El Mughaiyir On the following day Junction Station was captured; Jaffa was occupied on the 16th The capture of Junction Station definitely divided the Turkish armies; the 7th was left in the hills to defend Jerusalem, while the 8th was in the plain to the north of Jaffa; there was no good communication between the two armies south of the line Tul Karm-Nablus

Before Jerusalem.—Allenby had originally intended to wait until the development of his communications allowed of his whole force being brought up before turning into the difficult hills towards Jerusalem. He now decided to oppose the Turkish 8th Army with a detachment, while with the remainder of his force he turned east and advanced on Jerusalem at once. It was a bold decision, since he had only three infantry and two mounted divisions immediately available, and the supply of these strained the resources of his transport to the utmost; the troops available had already done much hard marching and fighting; little was known of the hill country save that it was very difficult and that there was only one road fit for wheels. The Anzac Mounted Division and the 54th Division were left to hold the Turkish 8th Army in the plain, while the remaining three divisions advanced into the hills, the 75th up the main road, the 52nd on its left and the Yeomanry Mounted Division on the left of the 52nd. Both these two latter divisions were entirely dependent on pack transport. The intention was to pivot on the 75th, when that division arrived within a certain distance of Jerusalem, and to swing the left across the Jerusalem–Nablus road north of the city. It was hoped thus to compel the surrender or withdrawal of the defending Turks and to avoid fighting in vicinity of the Holy City.

There was some hard fighting on Nov. 20 and 21; the 75th Division captured the crest of the ridge at Enab in a fog on Nov.

20 and on the 21st stormed the commanding hill of En Nabi Samweil; the 52nd made similar progress; and the yeomanry were at one time within a short distance of the Nablus road. But the British effort had shot its bolt; the men were suffering much from cold and wet, and the artillery support available was insufficient against strong prepared positions. The yeomanry were counter-attacked and driven back, and the 52nd and 75th could make no headway; by Nov. 24 it was evident that without fresh troops and a period of preparation Jerusalem could not be taken. The difficult passes through the hills had, however, been secured and the boldness of the advance justified.

A pause now took place while the British army improved its communications and thus enabled the 20th Corps to be brought up from Gaza, where it had been left for convenience of supply. It took over the line opposite Jerusalem, releasing the troops which had made the first attempt to strengthen the line in the plain. Falkenhayn during this period ordered small local counter-attacks all along the line in the hope of disorganizing Allenby's plans. But these attacks had no effect and merely wasted the best remaining elements of the Turkish force

The second attack on Jerusalem was delivered at dawn on Dec. 8, in mist and rain. The brunt of the fighting fell on the 60th (London) Division, assisted on the left by the 74th Division and on the right by the 53rd Division, which had previously moved up from Beersheba along the Hebron road to within striking distance. By the evening the Turks had decided to withdraw, and the city surrendered next morning Allenby made an official entry on Dec. 11. His brilliant campaign effectively removed all danger to Baghdad from the Yilderim army, the whole of which had of necessity been used in Palestine. The last reserves of Turkish man-power were practically exhausted; and Turkey was now in a far worse plight than when Germany had, at the commencement of 1917, undertaken the re-establishment of her military prestige by driving the British out of Baghdad. Falkenhayn had completely failed to grasp either the conditions of the theatre or the idiosyncrasies of Turkish troops. He was replaced early in 1918 by Liman von Sanders.

Rising of the Arabs.—The encouragement given by the British success to the Arab revolt caused an additional drain on Turkish resources The Arab revolt had broken out a year previously, when Hussein, the Sherif of Mecca, induced the Hejaz to rise against the Turk. Jeddah and Mecca were soon captured, but the Medina garrison held out. The revolt would probably have ended in the re-establishment of the Turks, or in desultory warfare with little result, had there not appeared a young Englishman with an understanding of the Arabs and a gift for guerrilla tactics. As Col. Lawrence he became famous. He persuaded Feisal, a son of Hussein, who led the Arab forces in the field, that the true policy lay not in assaults on the Turkish garrison in Medina, which if successful would merely rid the Turks of an embarrassment, but in gradually spreading the revolt northward up to the very gates of Damascus, with propaganda as the principal weapon, and in ceaseless raiding on the long exposed Turkish communications to Medina, which would form a constant drain on the enemy's resources.

In pursuance of this policy, Feisal, with Lawrence as his adviser, moved his base of operations from opposite Medina, first to Wejh and next to Akaba, which Lawrence had captured by a dashing raid. Gen. Allenby was quick to realize the service which the Arab rising was rendering to his operations, and was always sympathetic to Lawrence's requests for equipment or other aid.

Allenby's next aim was obviously to secure sufficient room for manoeuvre in front of Jerusalem in the hills and Jaffa in the plain. On Dec. 20 and 21 the 52nd Division forced a passage of the river El 'Auja, and drove the Turks 8m. north of Jaffa, thus improving the position in the plain. In the hills, all preparations had been made for an operation to drive the Turks farther from Jerusalem, when information was received that the Turks themselves were about to attack. Reinforcements, including the 1st Division, had reached them, and Falkenhayn was determined on an attempt to recapture the Holy City. The attack was pressed with great gallantry on Dec. 26, but made no impression; on the following days the counter-attack of the British 20th Corps carried them some 5 or 6m. forward and safeguarded Jerusalem from the north. Later, the eastern flank was secured by the capture of Jericho, which took place on Feb. 21. Early in March, the line was pushed still farther north, both in the hills and in the plain, by a series of small operations Thus by the spring a strong line had been secured, which might have been held by a reduced force in the exhausted state of the Turks

Plans for 1918.—Meanwhile, the future of the Palestine campaign in the general plan of the Allies for 1918 had become the subject of considerable discussion In view of the expected great German offensive in the West, there was a considerable body of opinion amongst those who directed the Allied strategy in favour of closing down as far as possible all commitments in minor theatres and of concentrating on the vital Western Front all reinforcements that could be spared from them It was also pointed out that the maintenance of large forces on the Palestine front entailed heavy losses in shipping—which was likely to prove the Achilles' heel of the Allies—since the submarine menace was especially serious in the Mediterranean

On the other hand, it was believed by many that neither side could force an issue on the Western Front, so formidably entrenched, and that the war could be won by the elimination of Germany's weaker Allies. They held that one more blow would force exhausted Turkey to sue for peace, and consequently advocated a further offensive in Palestine This policy was eventually adopted Two divisions, the 3rd and 7th Indian, were moved from Mesopotamia to reinforce Allenby's army, and all preparations for a fresh great offensive were being made, when the storm broke on the Western Front The success of the German offensive of March 21 caused a demand on Allenby for all the troops he could spare, which of course necessitated the postponement of his operations. During April and May, two complete divisions (the 52nd and 74th), 24 additional British battalions, nine regiments of yeomanry and 5½ heavy batteries were withdrawn from the Egyptian Expeditionary Force and despatched to France. These were gradually replaced by Indian cavalry from France and Indian units from India, and the Egyptian Expeditionary Force was reorganized on an Indian basis. It required much training and organization to weld all these new, and in some cases raw, units into an effective whole; but by the end of the summer the Egyptian Expeditionary Force was again ready to strike a decisive blow.

Preliminary Operations in 1918.—Meanwhile, in March and May, Allenby had carried out two raids to the east of the Jordan. These raids were an important part of his strategical plan He had decided that his next great advance should be initiated from his left flank along the coastal plain, where his great superiority in the mounted army could be exploited Therefore, the more of the Turkish army he could draw over to the opposite flank, east of the Jordan, the easier would it be to break through on the coast when the time came The railway junction at Deraa was a vital point in the Turkish communications If the Turkish command could be persuaded by demonstrations east of the Jordan that a move in force up the Hejaz railway was a possibility, and if Feisal's Arabs could be encouraged to attack Deraa and the railway where it ran down the Yarmuk valley, the Turks would be obliged to move troops east of the Jordan With these objects the raids east of the Jordan were undertaken Neither was a complete tactical success The first raid reached the railway near Amman and cut it in several places, but failed to capture Amman before supply difficulties caused by vile weather necessitated its withdrawal. In the second raid, the mounted troops reached Es Salt; but the Turks could not be driven from their strong positions in the Shunet Nimrin pass; and the defeat of the left flank guard of the mounted troops, with the loss of nine guns, compelled their withdrawal from Es Salt.

But the two raids had the desired effect of seriously alarming the Turks for their left flank. After the second, Liman von Sanders, who was now in command, had been induced to place one-third of his total force east of the Jordan, with a corresponding weakening of his forces west of the Jordan Allenby kept

alive the opposing commander's fears for this flank by maintaining throughout the summer, in spite of the heat, a considerable force in the valley of the Jordan. In July the German units operating with the Turks made an abortive attack on part of the position of the Desert Mounted Corps

IV. SYRIA

At the end of the summer of 1918 the Turkish forces were distributed as follows, on a front of 65m.: the 8th Army (five divisions and three German battalions), in the coastal plain and the foothills, faced the British 21st Corps; the 7th Army (four divisions), in the Judaean hills astride the Nablus road, faced the British 20th Corps; while the 4th Army (two divisions, one cavalry division, and one composite division), in the Jordan valley and east of the Jordan, was opposed to the Desert Mounted Corps. The total fighting strength of the Turks amounted to 32,000 rifles, 3,500 sabres, 350 guns; and that of the British to 57,000 rifles, 12,000 sabres, 540 guns.

Gen. Allenby's plan was the reverse of that of the Gaza-Beersheba battle; then, he had struck the Turkish left while persuading them that his real effort was to be made along the coast against their right; now, he proposed to advance along the coast, while deceiving the Turks into thinking that their left flank was threatened. Steps were skilfully taken to simulate a concentration of troops in the Jordan valley, whereas in fact only a skeleton force, the Anzac Mounted Division and a few battalions, was left there. The real concentration was being secretly made in the coastal plain, to which the bulk of the Desert Mounted Corps and the 60th Division of the 20th Corps were transferred For the success with which this concentration was concealed from the Turks to the last, British superiority in the air was largely responsible

A simple statement in figures shows how well Allenby had succeeded in obtaining an overwhelming superiority of force at the decisive point. When his concentration was complete, he had on a 15m. front in the coastal plain 35,000 infantry and 400 guns against only 8,000 Turks with 130 guns; and behind that mass of infantry were three cavalry divisions waiting to exploit success On the remaining 45m. of front he left only 22,000 infantry with 150 guns, facing 24,000 Turks with 270 guns. The Turks were still unaware of his intentions or of the distribution of his force

The September Offensive.—The attack was made at 4 30 A M. on Sept. 19. The preliminary bombardment lasted only 15 min., and the infantry assault, pushed at great speed and in overwhelming strength on a broad front, was rapidly successful By 7.30 A M. the leading cavalry division was through the enemy's lines. The orders to the mounted troops were to ride straight north, disregarding any hostile troops that did not directly bar their path, cross by the passes near Megiddo into the Plain of Esdraelon, and secure El Affule and Beisan to block the Turkish lines of retreat.

The leading troops of the 5th Indian Cavalry Division reached Nazareth, Liman von Sanders' headquarters, just 24 hours after their start, having covered 52m ; they failed only by accident to capture the person of the enemy commander-in-chief. The 4th Cavalry Division, moving farther to the east, covered 70m to Beisan in 34 hours. The advance was carried out with great dash and there were several instances of successful mounted attacks. A regiment of the 5th Cavalry Division rode over a Turkish battalion in the Plain of Esdraelon; and a brigade of the Australian Mounted Division galloped into the village of Jenin, occupied by a numerous force of Turks and Germans, thus sealing one of the main exits from the trap in which the Turkish 7th and 8th Armies were now caught Meanwhile the British infantry of the 21st Corps, after breaking through the Turkish fortified system in the plain, had wheeled to the right and driven the remnants of the Turkish 8th Army into the hills The 60th London Division (Maj.-Gen. Shea) actually reached Tulkeram before dark on the 19th, having fought and marched 18m. over very heavy going.

During the two days following Sept. 19 the 21st Corps continued to press their pursuit, while the 20th Corps also pushed forward along the Judaean hills to Nablus. The infantry of these two corps thus shepherded the straggling remains of the Turkish 7th and 8th Armies into the hands of the mounted troops. The Royal Air Force, with bombs and machine-gun fire, caused havoc amongst the bewildered Turkish transport, penned in and crowded on narrow hill roads. Only a few of the most determined Turks and some of the better fed and disciplined German units managed to break out to the east and cross the Jordan. The Germans fought well throughout the retreat.

Meanwhile, the Turkish 4th Army had remained inactive, ignorant of the fate of the other armies. On the 22nd it began a hurried retreat on Amman, hoping thence to escape up the Hejaz railway to Damascus. It paused at Amman till Sept. 25, awaiting the arrival of the Maan garrison from the south. But the 4th Army was now not only too late to rescue this force, but too late to secure its own safety. Feisal's Northern Arab Army was already between it and Damascus, and the whole countryside was rising against the Turks. The Arabs under Lawrence had already contributed largely to the discomfiture of the Turks by their raids on the lines of communication near Deraa, which they cut effectively from Sept. 17 onwards. They were thus in a position to delay and harass the 4th Army in its march north

The Final Victory.—The Turkish 7th and 8th Armies having been disposed of, Allenby ordered a part of his mounted troops to occupy Haifa, which was captured on Sept. 23 by a most gallant charge of the Indian Imperial Service Brigade. The remainder were despatched east and north-east to cut off the 4th Army and to capture Damascus The 4th Cavalry Division was to cross the Jordan near Beisan and move on Deraa, while the Australian Mounted Division was to make direct for Damascus by the road which runs from Nazareth to the west of Lake Tiberias, crossing the Jordan at Jisr Benat Yakub On Sept. 25 there was a fierce fight at Tell es Semakh at the southern end of Lake Tiberias The 4th Australian Light Horse Brigade charged in the dark over unknown ground and captured the village after hand-to-hand fighting with a force composed largely of Germans.

The Turkish 4th Army passed Deraa before the 4th Cavalry Division could head it off, but under pressure from this division and from the Arabs it gradually disintegrated. The end came on Sept. 30, when the Australian Mounted Division, which on Sept 28 had overcome some determined opposition to its crossing of the Jordan, succeeded in getting astride the Damascus-Beirut road just outside the city, cutting off the remains of the 4th Army Damascus was occupied next day, Oct 1. Immediately after the capture of Damascus, malaria and influenza broke out and placed a great proportion of the British mounted forces out of action It also seriously affected the very numerous Turkish prisoners

There was now no formidable Turkish force in southern Syria To complete its occupation, two columns advanced The 7th Division left Haifa on Oct 1 and moved up the coast to Beirut, which it reached on the 8th, and then on to Tripoli, which was occupied on the 18th; the 5th Cavalry Division, which though less affected by malaria and influenza than other formations, was considerably below establishment, advanced from Damascus by Homs (Oct. 16), Hama (Oct 20) to Aleppo, which was occupied on Oct. 26. The last fighting took place north of the town on the 28th On the 31st an armistice was concluded. Between Sept 19 and Oct 26 the British army had moved its front forward a distance of 360 miles. During this period the 5th Cavalry Division had actually covered over 500 miles. The captures included 72,000 Turks and nearly 4,000 Germans and Austrians, 350 guns, 800 machine guns, and large quantities of transport and other material. History records few victories, if any, more striking and complete

Conclusions.—These campaigns of the Egyptian Expeditionary Force are of great strategical interest. For the military student they will always remain classic examples of the use of mounted troops and of the value of mobility. Conditions of war change, and it may be that some mechanical form of transport will entirely replace the horse as the means by which mobility can be secured But the power of mobility as a strategical weapon in the hands of a commander who has the knowledge and the determination to use it as did Gen. Allenby will only be enhanced. A second strategical lesson is the advantage gained by a commander who can conceal his intentions from his opponent In

both his great battles against the Turk, Allenby completely deceived his adversary as to his plans, and had thus secured a decisive superiority before the battle was joined. Only constant foresight and careful preparation can effect this. Air superiority is a factor of increasing importance in this question of concealment of plans and movements.

Finally, the dependence of all strategy on the communications may be stressed. The Turks added to the initial handicap which their long and difficult lines of communication imposed on them by their neglect to improve these and by the inefficiency of their working. Falkenhayn, during his command, entirely failed to adapt his strategy to the limitations necessitated by his means of transport. On the British side, the greatest care was devoted to developing the communications in accordance with the strategical plan, and the supply services were thus able to cope even with such problems as were presented by the rapidity of the advance to Damascus and Aleppo.

PALESTRINA, GIOVANNI PIERLUIGI DA (1526–1594), Italian composer, was born in Palestrina (the ancient Praeneste), at the foot of the Sabine mountains, in 1526. He appears in the musical publications and other documents of his day under all manner of designations derived from his birthplace and his baptismal names. The full Latin signature is Joannes Petraloysius Praenestinus; and the most elusive designation is Gianetto, which has sometimes concealed the authorship of a first-rate Palestrina madrigal.

Palestrina seems to have been at Rome from 1540 to 1544, when he is supposed to have studied under Gaudio Mell, a person of doubtful identity, but not to be confused with Goudimel. On June 12 Palestrina married Lucrezia de' Goris. By Lucrezia Palestrina had four sons, three of whom died after showing early promise in compositions published in an earlier volume of their father's works. (Of the three, Ridolfo, Sylla and Angelo, it is thought that Sylla may be a brother or cousin.) The surviving son, Igino, is not viewed with favour by the biographers, who ascribe to him unworthy motives for the publication of certain posthumous works which his father is supposed to have wished suppressed.

Palestrina, more than any other composer, except Victoria and Morales, devoted himself whole-heartedly to the service of the Church, and aimed at the perfect harmony of musical art, not only with the spirit of Catholic devotion, but with liturgical convenience in the humblest practical matters. Palestrina's official career as a composer under papal protection began in 1551, when Julius III. had him appointed magister cappellae and magister puerorum at the Cappella Giulia, S. Pietro in Vaticano. Three years later Palestrina published, and dedicated to Pope Julius, his first book of masses. The *Missa Ecce sacerdos* is a noble, if long-winded work, and other masses in the volume show that Julius had chosen one of the greatest composers of his day as an object of his protection. (The beautiful *Missa Pro Defunctis* was added to later editions.)

In 1555, on Jan. 13, Julius appointed Palestrina a singer in the Sistine chapel. Palestrina's friend, Animuccia (*q.v.*) succeeded him at the church of S. Giulia. Palestrina enjoyed this position for only seven months. Five weeks after Palestrina's appointment Julius died; his successor, Marcellus II., reigned for 23 days, and was followed by Paul IV. who, at the end of July, began setting his house in order by pensioning off Palestrina and two other married members of the Sistine choir. A few months later Palestrina was appointed choir-master of the church of St. John Lateran, but this did not prove to be a full compensation for the loss of his position in the Sistine chapel.

During Palestrina's tenure of his post at St. John Lateran, which he gave up in 1558, he composed a book of Lamentations (*i.e.*, settings of the Holy Week lessons from the Lamentations of Jeremiah) and a book of Magnificats for all the eight Ambrosian tones or modes. Neither of these books was published till long after Palestrina's death, and the elaborate Magnificats with their numerous canonic movements in Flemish style were hardly known at all until their inclusion in the modern edition of Palestrina's complete works in score published by Breitkopf and Härtel. Palestrina's famous Lamentations, used in the Sistine chapel and known as his first book, are really his third and last book, being published in 1588. From the earlier period, however, comes an opusculum of enormous importance, closely allied to the later Lamentations in its syllabic declamation, its note-against-note harmony, and its profoundly devout pathos. This is the Improperia, sung on Good Friday. The Improperia immediately made a profound impression, and Pope Pius IV. ordered a copy to be made for the Sistine chapel. Palestrina accordingly began again to compose specially for the Papal choir; and in the *Missa Ut Re Mi Fa Sol La* we find the perfectly mature Palestrina style in a work constructed on the quaintest of Flemish formulas.

The first of Palestrina's four books of masses was republished in 1591 with the addition of a *Missa Pro Defunctis*, a very beautiful work in which no attempt is made to set the *Dies irae*, and a *Missa Nasce la gioja mia*.

The *Missa Papae Marcelli* appeared in 1567 as the last item in Palestrina's second book of masses. The volume is dedicated to the king of Spain; and in the dedication Palestrina says that, following the advice *gravissimorum, et religiosissimorum hominum*, he has given his best energies to the composition of masses *novo modorum genere*. Dr. Knud Jeppesen, in his treatise *Palestrina and the Dissonance* (Copenhagen and Oxford, 1927), has pointed out exactly where the problem lay, if Palestrina was not to reduce the whole music of the mass to note-against-note harmony or *falsobordone* like his Improperia and Tallis's Responses. Simple statistics show that, whereas in earlier masses Palestrina develops his polyphony so that the voices are hardly ever singing the same words together, in the *Missa Papae Marcelli* each clause of the text is heard in the highest voice, or in several voices simultaneously before the polyphony is allowed to make the clauses overlap, and this is a general feature of Palestrina's mature style.

Yet there was no need for Palestrina to write a work specially to meet this demand. He had already formed the style for it, and his reference to masses *novo modorum genere* applies to six other masses besides the *Missa Papae Marcelli*. The Improperia had already revealed him as the greatest master of harmonic colour in note-against-note declamation; this very mastery made him content to write most of his early madrigals in a homophonic style which rash critics might deem primitive; he was, on the other hand, a polyphonist to whom canonic devices were a child's play, the rules of which it was no trouble to follow and no sin to disregard. Any volume of Palestrina's works would have revealed to the cardinals that here was the man they needed. Every volume, except the earliest, contained works of more than one period: Palestrina published his works, not when he wrote them, but when he could afford to publish them, as the dedication of his First Book of Lamentations (really his last) plaintively shows.

The third book of masses, which appeared in 1770, shows at least three styles. It is difficult to suppose that the *Missa Repleatur os meum* can be anything but an early work; it is the heaviest and, for the most part, the dullest music Palestrina ever wrote. The materials of *Missa Brevis*, the *Missa De Feria* (a quiet work without Gloria and Credo), the *Missa L'Homme Armé*, and the above-mentioned *Missa Ut Re Mi Fa Sol La*, show how futile is any attempt to guess the quality of Palestrina's work from its theoretic or formal origins. *L'Homme Armé* is the notorious old tune on which Flemish composers based puzzles; and Palestrina bases on it an encyclopaedia of rhythmic problems. Yet his result here, and in the obviously ridiculous scheme of *Ut Re Mi Fa Sol La* is of the quality of the *Missa Brevis* and not far below the *Missa Papae Marcelli* itself.

In 1571 Palestrina was reappointed as choir-master of St. Peter's, on the death of Animuccia. In 1577 Gregory XIII. commissioned Palestrina and his colleague, Zoilo, to "purify" the musical text of the liturgical (or Gregorian) chant. It is not surpris-

ing that Palestrina, and his colleagues and successors in the task, conceived that to purify was to simplify. The Spaniards knew better, and protested. Palestrina's share in the work soon ceased; but the Palestrinian tradition of plain-chant remained official until the musical liturgiologists of Solesmes restored the ancient style at the beginning of the 20th century. (*See* MUSIC, sec. 3.)

Palestrina's fourth book of masses appeared in 1581. In this volume alone do we see traces of ecclesiastical interference.

In 1584 appeared Palestrina's wonderful setting of the Song of Solomon, in 29 motets, which he describes in his dedication as of a "genus alacrior," while he deplores that he had ever sung of a profaner love. Neither madrigals nor motets can give a complete view of Palestrina if this unique work, which is neither liturgical nor secular, is unknown. Like all Palestrina's music, it is practically difficult to know; the work cannot be appreciated in less than its entirety; and its entirety is that of a bound volume of a magazine. There is no occasion on which it can be performed as a whole in public. We must live with it, and form ourselves into groups of singers who can produce it among themselves.

The famous book of Lamentations, known as the first book, appeared in 1588, with a dedication to Pope Sixtus V. in which Palestrina complains of the poverty which compels him in his old age to publish this work in a small format and to leave many other things unpublished. The latter complaint is nobly justified by the enormous number and importance of his posthumous works. He published six books of masses. His son, Igino, published the seventh; but another seven posthumous volumes followed year by year, and late in the 19th century Haberl filled yet another volume with some of Palestrina's greatest works.

A set of hymns for the whole year appeared in 1589. They are severe and elaborate compositions, treating the themes of the plain-chant in close fugue. Only the alternate stanzas are set, the rest being left to unharmonized plain-chant.

It is possible that the *Missa Pro Defunctis,* which appears in the 1591 edition of the First Book of Masses may have been written for Sixtus V., who died in 1590. The *obiter dicta* of this pontiff, as cited by Brini, have given a bad reputation to the harmless *Missa Tu et pastor ovium,* and have not exaggerated the glories of the *Missa Assumpta est Maria.* During the two years' pontificate of Gregory XIV., Palestrina produced a double set of Magnificats in the eight tones, on the lines of his hymns, one set giving the odd verses in polyphony, and the other set the even. In 1593, in the reign of Clement VIII., Palestrina dedicated to the abbé Anton Baume another great volume of Offertories for the whole year, in his finest motet style. His last publication was a book of Madrigali Spirituali, also one of his greatest and most deeply felt works. He was preparing a seventh volume of masses when he died on Feb. 2, 1594.

It is immensely significant that the interest in an almost homophonic harmonic colour was already present in Palestrina's early madrigals, while at the same time he was capable of absorbing himself in abstruse Flemish puzzles. Facile he never was; and his weaker works are heavy. Haberl, in speaking of the *First* (really the last) *Book of Lamentations,* finely characterizes Palestrina's special power as "the capacity to remain true to a fundamental mood." The range of Palestrina's fundamental moods is wide. The despair of Job has never found deeper and truer expression than in Palestrina's *Paucitas dierum* in the Fifth Book of Motets; nor has any more glorious music than that of *Dum complerentur* in the Second Book of Motets been made to tell us of the ecstasy that came with the mighty rushing wind and fiery tongues of Pentecost. And it is all achieved in and by a style which is the quintessence of purity. The severest discipline of present-day academic counterpoint has no more to do with it than Tertullian's Latin has with the style of Virgil. R. O. Morris has shown, in *The Technique of Counterpoint* (Oxford University Press), how far our school teaching has travelled from the true Palestrina discipline; and Jeppesen, in the work above cited, shows how minutely accurate Palestrina's obedience to his own discipline is. And this is not asceticism. It denies itself nothing; for it is God-intoxicated and its peace is in the Will that inspires it.

Palestrina's works, as contained in the complete edition published by Breitkopf and Härtel, comprise 256 motets in seven volumes, the last two consisting largely of pieces hitherto unpublished, with one or two wrongly or doubtfully ascribed to Palestrina; 15 books of masses, of which only six were published in Palestrina's lifetime, the seventh being incompletely projected by him, and the 14th and 15th first collected by Haberl in 1887 and 1888; three books of magnificats, on all the customary tones; one volume of hymns; one volume (two books) of offertories for the whole year; a volume containing three books of litanies and several 12-part motets; three books of lamentations; a very large volume of madrigals containing two early books and 30 later madrigals collected from mixed publications; two books of *Madrigali spirituali,* and four volumes of miscellaneous works, newly discovered, imperfectly preserved and doubtful. The fourth volume of motets contains the Song of Solomon; and the fifth volume is a collection designed for use throughout the Church year.

(D. F. T.)

PALEY, FREDERICK APTHORP (1815–1888), English classical scholar, born at Easingwold, Yorks., was the grandson of William Paley and was educated at Shrewsbury and St. John's College, Cambridge. His conversion to Roman Catholicism forced him to leave Cambridge in 1846, but he returned in 1860 and resumed his work as a "coach," until in 1874 he was appointed professor of classical literature at the newly founded R.C. University at Kensington. This was closed in 1877 for lack of funds, and Paley removed to Boscombe, where he died on Dec. 8, 1888. His most important editions are: Aeschylus, with Latin notes (1844–47; 4th ed., 1879), Euripides (2nd ed., 1872), Hesiod (2nd ed., 1883), Homer's *Iliad* (2nd ed., 1884), Sophocles, *Philoctetes, Electra, Trachiniae, Ajax* (1880)—all with English commentary; select private orations of Demosthenes (3rd ed., 1896–98); Theocritus (2nd ed., 1869). He possessed considerable knowledge of architecture, and published manuals of *Gothic Architecture* (1846) and *Gothic Mouldings* (6th ed., 1902).

PALEY, WILLIAM (1743–1805), English divine and philosopher, was born at Peterborough. He was educated at Giggleswick school, of which his father was head master, and at Christ's College, Cambridge. He graduated in 1763 as senior wrangler, became fellow in 1766, and in 1768 tutor of his college. He lectured on Clarke, Butler and Locke, and also delivered a systematic course on moral philosophy, which subsequently formed the basis of his well-known treatise on the *Evidences of Christianity.* The subscription controversy was then agitating the university, and Paley published an anonymous *Defence* of a pamphlet in which Bishop Law had advocated the retrenchment and simplification of the 39 Articles. In 1776 he was presented to the rectory of Musgrave in Westmoreland, supplemented at the end of the year by the vicarage of Dalston, and presently exchanged for that of Appleby. In 1782 he became archdeacon of Carlisle. At the suggestion of his friend John Law (son of Edward Law, bishop of Carlisle and formerly his colleague at Cambridge), Paley published (1785) his lectures, revised and enlarged, under the title of *The Principles of Moral and Political Philosophy.* The book at once became the ethical text-book of the University of Cambridge, and passed through fifteen editions in the author's lifetime. He strenuously supported the abolition of the slave trade, and in 1789 wrote a paper on the subject. *The Principles* was followed in 1790 by his first essay in the field of Christian apologetics, *Horae Paulinae, or the Truth of the Scripture History of St. Paul evinced by a Comparison of the Epistles which bear his Name with the Acts of the Apostles and with one another,* probably the most original of its author's works. It was followed in 1794 by the celebrated *View of the Evidences of Christianity.* Paley's latitudinarian views are said to have debarred him from the highest positions in the Church, but he became a canon of St. Paul's, subdean of Lincoln, and rector of Bishopwearmouth. During the remainder of his life his time was divided between Bishopwearmouth and Lincoln. In 1802 he published *Natural Theology, or Evidences of the Existence and Attributes of the Deity collected from the Appearances of Nature,* his last, and, in some respects, his most remarkable book. He died on May 25, 1805.

The face of the world has changed so greatly since Paley's day that we are apt to do less than justice to his undoubted merits. He is nowhere original, and nowhere profound, but his strong reasoning power, his faculty of clear arrangement and forcible statement, place him in the first rank of expositors and advocates.

For his life, *see* Lives, by G. W. Meadley (1809) and his son Edmund Paley, prefixed to the 1825 edition of his works; Leslie Stephen in *Dictionary of National Biography; Quarterly Review, ii.* (Aug. 1809), ix. (July 1813). On Paley as a theologian and philosopher, *see* Leslie Stephen, *English Thought in the Eighteenth Century*, i. 405 *seq.*, ii. 121 *seq.*; R. Buddensieg, in Herzog-Hauck's *Realencyklopädie für protestantische Theologie*, xiv. (1904).

PALFREY, JOHN GORHAM (1796–1881), American historian, was born in Boston, Mass., on May 2, 1796. He graduated at Harvard, 1815, and became pastor of the Brattle Square Unitarian church, Boston, 1818–31. He was professor of sacred literature in the Harvard divinity school, 1830–39. Entering politics, he was secretary of State of Massachusetts, 1844–47; a representative in Congress, 1847–49; and postmaster of Boston, 1861–67. He was editor of the *North American Review*, 1835–43. As a writer he is best known by his *History of New England to the Revolutionary War* (1858–60). He died at Cambridge, Mass., on April 26, 1881.

PALGHAT, a town of British India, in the Malabar district of Madras on a short branch of the Madras railway from Olavakhot. Pop (1921), 45,487. As the key to Travancore and Malabar from the East, it was formerly of considerable strategic importance. The fort fell into British hands in 1768, and subsequently formed the basis of many of the operations against Tippoo. The easy ascent by the Palghat pass affords the chief route from the west coast to the interior. There is a government college.

PALGRAVE, SIR FRANCIS (1788–1861), English historian, was the son of Meyer Cohen, a Jewish stockbroker, and was born in London in July 1788. He edited several volumes for the Record Commission. In 1832 he was knighted, and he became deputy-keeper of the public records in 1838, holding this office until his death at Hampstead on July 6, 1861. Palgrave's most important work is his *History of Normandy and England* (4 vols. 1851–1864), which deals with the history of the two countries down to 1101.

He also wrote *History of England, Anglo-Saxon Period* (1831); *Rise and Progress of the English Commonwealth* (1832); *Essay upon the original Authority of the King's Council*, etc. His collected historical works were edited by his son, Sir R. H. I. Palgrave, in 1919.

PALGRAVE, FRANCIS TURNER (1824–1897), English critic and poet, eldest son of Sir Francis Palgrave (*q.v.*), was born at Great Yarmouth, on Sept. 28, 1824. He was educated at Charterhouse, and at Balliol College, Oxford. In 1846 he interrupted his university career to serve as assistant private secretary to Gladstone, but returned to Oxford the next year, and took a first class in Literae Humaniores. From 1847 to 1862 he was fellow of Exeter College, and in 1849 entered the Education Department at Whitehall. In 1850 he became vice-principal of Kneller Hall Training College at Twickenham. There he came into contact with Tennyson, and laid the foundation of a lifelong friendship. When the training college was abandoned, Palgrave returned to Whitehall in 1855, becoming examiner in the Education Department, and eventually assistant secretary. He married, in 1862, Cecil Grenville Milnes, daughter of James Milnes-Gaskell. In 1885 he succeeded John Campbell Shairp as professor of poetry at Oxford. He died in London on Oct. 24, 1897. Palgrave published some volumes of poetry, *Visions of England*, (1880–81), *Amenophis* (1892), and others; but his work as a critic was by far the more important. His *Landscape in Poetry* (1897) showed wide knowledge and critical appreciation of one of the most attractive aspects of poetic interpretation.

But Palgrave's principal contribution to the development of literary taste was contained in his *Golden Treasury of English Songs and Lyrics* (1861), an anthology of the best poetry in the language constructed upon a plan sound and spacious, and followed out with a delicacy of feeling which could scarcely be surpassed. Palgrave followed it with a *Treasury of Sacred Song* (1889), and a second series of the *Golden Treasury* (1897), including the work of later poets, but in neither of these was quite the same exquisiteness of judgment preserved.

Among his other works were *The Passionate Pilgrim* (1858), a volume of selections from Herrick entitled *Chrysomela* (1877), a memoir of Clough (1862) and a critical essay on Scott (1866). *See* Gwenllian F. Palgrave, *F. T. Palgrave* (1899).

PALGRAVE, SIR REGINALD (1829–1904), became a solicitor in 1851; but two years later was appointed a clerk in the House of Commons, becoming clerk of the House on the retirement of Sir Erskine May in 1886. He was made a K.C.B. in 1892, retired from his office in 1900, and died at Salisbury on July 13, 1904. Sir Reginald wrote *The Chairman's Handbook; The House of Commons: Illustrations of its History and Practice* (1869); and *Cromwell: an appreciation based on contemporary evidence* (1890).

PALGRAVE, SIR ROBERT HARRY INGLIS, Kt. 1909 (1827–1919), British banker and economist, was born at Westminster on June 11, 1827, the son of Sir Francis Palgrave (*q.v.*). He was educated at Charterhouse and entered Barclay's bank at Yarmouth. In 1875 he was one of three representatives of the English issuing country bankers who gave evidence before the select committee on Banks of Issue. He edited *The Economist* from 1877 to 1883, and published many works on banking, as well as *The Local Taxation of Great Britain and Ireland* (1871). He edited *Palgrave's Dictionary of Political Economy* (1894–1906; new ed. 1925). He died at Bournemouth on Jan. 25, 1919.

PALIKAO, CHARLES GUILLAUME MARIE APPOLLINAIRE ANTOINE COUSIN-MONTAUBAN, Comte de (1796–1878), French general and statesman, was born in Paris on June 24, 1796. He served as a cavalry officer in Algeria, and captured Abd-el-Kader. He was promoted general of division and commanded the province of Constantine, receiving a home command in 1858. In 1859 he led the French troops in the joint French and British expedition to China. In 1862 Napoleon III. gave him the title of comte de Palikao. In 1865 he commanded the IV. army corps at Lyons. After the first disasters of 1870 had shaken the Ollivier ministry the empress regent made him minister of war, and he became president of the council (Aug. 10). He reorganized the military resources of the nation, and claimed to have created three new army corps, 35 new regiments, and 100,000 *gardes mobiles* in 24 days. His scheme to send the army of Châlons to raise the blockade of Metz ended with the disaster of Sedan. After the capitulation of the emperor the dictatorship was offered to Palikao, but he refused to desert the empire, and proposed a council of national defence. But the chamber was invaded by the mob, and Palikao fled to Belgium. In 1871 he published *Un Ministère de la guerre de vingt-quatre jours*. He died at Versailles on Jan. 8, 1878.

PALI LANGUAGE AND LITERATURE. *Pāli* was applied to the text of the Hīnayāna Buddhist scripture (*see* Buddhism) preserved in Ceylon. Used now for the language in which those texts were written, it usually includes the language of the subsequent commentaries and other writings. By some its meaning has been extended to cover all the cognate Middle Indian dialects found in the inscriptions and other documents. The present article will be confined to the language of the Pali canon and its commentary.

Origin.—The Aryan or Indo-Aryan branch of the Indo-European family of languages was introduced into India by invading tribes during probably the latter half of the second millennium B.C. The oldest document of this language, the Ṛgveda (*see* Sanskrit), was handed down only by an oral, though exceedingly exact, tradition. The first contemporary documents, however, the Inscriptions of Asoka (*q.v.*), are written in a dialect or dialects which, although clearly later forms of that of the Vedic texts, already show marked dialectical differences according to the districts in which they were set up. Although these date only from the middle of the 3rd century B.C., it is certain that even by the latter half of the 6th century B.C. (the probable period of the Buddha's preaching) the Aryan language had spread by conquest and infiltration over very considerable areas of northern India.

There were at this period two considerable kingdoms in the north and east of the Gangetic plain, one Kosala (corresponding roughly to modern Oudh), the other Magadha (corresponding to the districts of Patna and part of Gaya). Magadha later swallowed up Kosala. The Buddha himself, a native of Kosala, passed much of his ministry in Magadha; and it has been held that the language of the Pali texts was based upon the contemporary dialect either of Kosala or of Magadha, the latter view being in particular supported by the use of the term Māgadhī or language of Magadha applied to Pali. But even if original collections of the Buddha's sayings were handed down in the current dialect of Kosala or Magadha, they may have been subsequently re-edited or re-written in some other dialect. Others see the origin of the language of the existing texts in the dialect of some later centre of Buddhist learning, such as Takṣaśilā in the north-west or Ujjēnī (modern Ujjain), capital of Avanti in the west, the influence of which has been considered by others as predominant in the formation of the language.

Pali, in its earliest texts, is a language of mixed dialectical forms, some common to both north-western and eastern dialects; others peculiarly eastern. These may be due to the influence of an original recension in an eastern dialect or to the general influence of the eastern vernaculars on the other Indo-Aryan languages, especially during the predominance of the Mauryan empire with its eastern capital. Its main characteristics are those of a western dialect. Tradition has it that the Buddhist scriptures were brought to Ceylon by Asoka's son, Mahinda, who had spent his childhood in Ujjēnī. In Ceylon the study and the use of Pali, which died out in India, was prosecuted by the Buddhists and carried thence to Burma and Siam, where it still remains to some extent the language of literature or at least of religion.

Sounds.—Pali possessed the following sounds: Vowels: *a, ā, i, ī, u, ū, ē, ō*. Consonants: stops and nasals: gutturals: *k, kh, g, gh, ṅ;* palatals: *c, ch, j, jh, ñ;* cerebrals: *ṭ, ṭh, ḍ, ḍh, ṇ;* dentals: *t, th, d, dh, n;* labials: *p, ph, b, bh, m*. Liquids: *r, l, ḷ*. Semi-vowels: *y, v*. Sibilant: *s*. Aspirate: *h*. Undefined nasal: *ṁ*. This system derived with certain modifications from that of Vedic Sanskrit. Among the vowels Skt. *ai, au* became *ē, ō,* thus confused with original *ē, ō*. Skt. *ṛ* became *a* (and in some words *i* or *u*). Thus the three members of the characteristic vowel-alternations of Sanskrit were reduced to two: *i:ē, u:ō;* while that of *ṛ:ar:ār* was upset altogether. This system was further confused by the shortening of all Sanskrit long vowels in closed syllables, which caused, for example, the loss of all distinction between such pairs as Skt. *candráḥ*, "moon" and *cāndraḥ*, "lunar," since both became *candō*.

The Sanskrit consonants, as single sounds, remained in principle unchanged, except that all sibilants: *ś, ṣ, s* were confused under one form, *s*. On the other hand consonants in contact with each other were liable to change, a stop being assimilated to a following stop (*e.g., satta, duddhaṁ* from Skt. *saptá, dugdhám*) and a continuant to a following or preceding stop (*e.g., akkō, aggi* from Skt. *arkáḥ, agníḥ*). If the assimilated consonant was a sibilant, the resultant group was aspirated (*e.g., atthi, vacchō, acchi* from Skt. *ásti, vatsáḥ, ákṣi*). Lastly, all final consonants had disappeared (*e.g., vijju* from Skt. *vidyút*).

Nouns.—Its grammatical forms are clearly derived from Vedic Sanskrit. But the process of simplification and normalization has proceeded much further. In the declension of the noun the dual has disappeared, leaving only two numbers, singular and plural. Among the cases the dative has almost lost its separate existence, its place being taken by the genitive; and in general, chiefly through the action of sound-change, the number of cases with separate terminations has been greatly reduced. The declension in the singular of a feminine stem in *-ā* illustrates this:

	Sanskrit	Pali		Sanskrit	Pali
nom.	*kanyā̀*	*kaññā*	abl.	*kanyā̀yāḥ*	*kaññāya*
acc.	*kanyā̀m*	*kaññaṁ*	gen.	*kanyā̀yāḥ*	*kaññāya*
inst.	*kanyā̀yā*	*kaññāya*	loc.	*kanyā̀yām*	*kaññāya* or *-aṁ*
dat.	*kanyā̀yai*	*kaññāya*	voc.	*kánye*	*kaññe*.

Verbs.—The changes in the verbal system are still greater. The athematic stems of Vedic (in which the termination is added directly to the root) have been mostly replaced by thematic stems, in which the insertion of the vowel *a* preserves the individuality of both root and termination (*e.g., lēḍhi, lihánti* have been replaced by *lēh-a-ti, lēh-a-nti*). The middle voice is in process of disappearance. Among the moods, traces are still found in the oldest stratum of the subjunctive, but like the imperative and optative it is confined to the present stem. Of the tenses, the perfect has ceased to play any part in regular conjugation, while the imperfect and aorist have combined into one tense. The use of participial phrases in place of finite verbal forms is increasing.

Numerals.—In general the numeral system is that of Sanskrit, alterations in form being due to sound-change, rather than to the introduction of any new principle.

Gender.—Gender is grammatical and is divided into three categories: masculine, feminine and neuter—following the system of Sanskrit. But there is already some disturbance of the system. The neuter of the numerals for "two" and "three" is used sometimes with masculine and feminine nouns. A growing confusion between masculine and neuter stems presages the loss in most of the modern languages of all distinction between these genders.

Vocabulary.—The vocabulary, though based primarily on that of Vedic Sanskrit, shows changes and developments of meaning and the admission of new words. Some words of the modern languages make their first recorded appearance in Pali, *e.g., kaḍḍhati*, "drags" (replacing Skt. *kárṣati*) appears to-day in Panjabi *kaḍḍhe*, Hindi *kāṛhe*, etc. Later the growing influence of literary Sanskrit caused the inclusion of numerous new words of that language disguised under a Pali form.

LITERATURE

The canonical texts of the literature of Pali are divided into three collections called *Piṭakas, i.e.*, baskets. This figure of speech refers not to a crate in which things can be stored, but to the baskets, used in India in excavations as a means of handing on the earth from one worker to another, hence to a *tradition*. The first *Piṭaka* contains the *Vinaya*—that is, Rules of the Order; the second the *Suttas*, giving the doctrine, and the third the *Abhidhamma*, analytical exercises in the psychological system on which the doctrine is based. These have now all, mainly through the work of the Pali Text Society, been published in Pali.

The *Vinaya* was edited in 5 vols. by H. Oldenberg; and the more important parts of it have been translated into English by Mrs. Rhys Davids and Oldenberg in their *Vinaya Texts*.

The *Sutta Piṭaka* consists of five *Nikāyas* (collections), four principal and one supplementary. The four principal ones have been published for the Pali Text Society, and nearly all have been translated into English. These four *Nikāyas*, 16 vols. in all, are the main authorities for the doctrines of early Buddhism. The fifth *Nikāya* is a miscellaneous collection of treatises, mostly very short, on a variety of subjects. It contains lyrical and ballad poetry, specimens of early exegesis and commentary, lives of the saints, collections of edifying anecdotes and of the now well known *Jātakas* or Birth Stories. This had by 1927 been edited for the Pali Text Society in 16 vols. by various scholars.

Of the seven treatises contained in the *Abhidhamma Piṭaka* all had by 1923 been published by the Pali Text Society, and three had been translated by Mrs. Rhys Davids, Mr. S. Z. Aung and Dr. B. C. Law. A description of the contents of these books in the canon is given in Rhys Davids' *American Lectures*, pp. 44–86.

As yet but little progress has been made in the historical criticism of these books. Out of the 29 works contained in the three *Piṭakas* only one claims to have an author. That one is the *Kathā Vatthu*, ascribed to Tissa the son of Moggalī, no doubt

identical with Upagupta, the teacher of Asoka, who presided over the third council held under Asoka. It is the fifth book of the third *Piṭaka.* All the rest of the canonical works grew up in the schools of the Order, and most of them appear to contain documents, or passages, of different dates. In the introduction to his edition of the *Vinaya,* Oldenberg has shown that there are at least three strata in the existing presentation of the Rules of the Order, the oldest portions going back probably to the time of the Buddha himself It seems probable that the *Vinaya* and the four *Nikāyas* were put substantially into the shape in which we now have them before the council at Vesāli, 100 years after the Buddha's death, that alterations and additions were made in them, and most of the five *Nikāyas* and the *Abhidhamma* books completed, at various times down to the third council under Asoka; and that the canon was then considered closed No evidence has yet been found of any alterations made, after that time, in Ceylon; but there were probably before that time, in India, other books, now lost, and other recensions of some of the above

Of classical Pali in northern India subsequent to the canon there is but little evidence Three works only have survived These are the *Milinda-pañha;* the *Netti Pakarana;* and the *Peṭakopadesa* The first belongs to the north-west, the others to the centre of India, and all three may be dated vaguely in the 1st or 2nd centuries A D They are the sole survivors of what must have been a vast and varied literature Prof Takakusu has shown the possibility of several complete books belonging to it being still extant in Chinese translations and we may yet hope to recover original fragments in central Asia, Tibet, or Nepal.

At p. 66 of the *Gandha Vaṃsa,* a modern catalogue of Pali books and authors, written in Pali, there is given a list of ten authors who wrote Pali books in India, probably southern India. We may conclude that these books are still extant in Burma, where the catalogue was drawn up Three only of these ten authors are otherwise known The first is Dhammapāla, who wrote in Kāñcipura, the modern Conjevaram in south India, in the 5th century of our era His principal work is a series of commentaries on five of the lyrical anthologies included in the miscellaneous *Nikāya* Four of these have been published by the Pali Text Society, and E Hardy has discussed in the *Z D M G.* (1897) pp. 105–127, all that is known about him. Dhammapāla wrote also a commentary on the Netti mentioned above The second is Buddhadatta of the same date, author of prose and metrical comments on *Vinaya* and *Abhidhamma,* edited by A. P. Buddhadatta for the Pali Text Society The third is Buddhaghosa, who wrote the comprehensive treatise, *Visuddhi Magga,* translated as *The Path of Purity,* by P Maung Tin for the Pali Text Society, and recast in Pali much of the *Piṭaka* Commentary preserved in Ceylon in Sinhalese.

The whole of these Pali Books composed in India have been lost there They have been preserved for us by the unbroken succession of Pali scholars in Ceylon and Burma These scholars (most of them members of the Buddhist Order) not only copied and recopied the Indian Pali books, but wrote a very large number themselves We are thus beginning to know something of the history of this literature. Two departments have been subjected to critical study; the Ceylon chronicles by Prof. W. Geiger in his *Mahāvaṃsa und Dīpavaṃsa,* and the earlier grammatical works by Prof. O Franke in two articles in the *Journal of the Pali Text Society* for 1903, and in his *Geschichte und Kritik der einheimischen Pali Grammatik.* Dr. Forchhammer in his *Jardine Prize Essay,* and Dr Mabel Bode in her *Pali Literature in Burma,* have collected many details as to the Pali literature in Burma, and Dr. G. P. Malalasekera has done the same for that in Ceylon in his *Pali Literature in Ceylon.*

The result of these investigations show that in Ceylon from the 3rd century B C. onwards there has been a continuous succession of teachers and scholars. Many of them lived in the various *vihāras* or residences situate throughout the island; but the main centre of intellectual effort, down to the 8th century, was the Mahā Vihāra, the Great Minster, at Anurādhapura. This was, in fact, a great university. Authors refer, in the prefaces to their books, to the Great Minster as the source of their knowledge And to it students flocked from all parts of India The most famous of these was Buddhaghosa, from Behar in north India, who studied at the Minster in the 5th century A D., and wrote there all his well known works. Several of these, out of about 20 still extant, have been and are being edited for the Pali Text Society. About a century before this the *Dīpavaṃsa,* or Island Chronicle, had been composed in Pali verse, apparently the work of a beginner in Pali composition This was followed in about a century by Mahanāma's *Mahāvaṃsa,* a more elegant recast of the *Dīpavaṃsa.* No work written in Pali in Ceylon at a date older than the former has yet been discovered It would seem that up to the 4th century of our era the Sinhalese had written exclusively in their own tongue; that is to say that for six centuries they had studied and understood Pali as a dead language without using it as a means of literary expression In Burma, on the other hand, where Pali was probably introduced from Ceylon, no writings in Pali can be dated before the 11th century of our era Of the history of Pali in Siam very little is known There have been good Pali scholars there since late mediaeval times A very excellent edition of the 27 canonical books and the principal commentaries has been recently printed there, and there exist in our European libraries a number of Pali mss. written in Siam

It would be too early to attempt any estimate of the value of this secondary Pali literature Only a few volumes out of several hundreds known to be extant in ms. have yet been published. But the department of the chronicles, the only one so far at all adequately treated, has thrown so much light on many points of the history of India that we may reasonably expect results equally valuable from the publication and study of the remainder The works on religion and philosophy especially will be of as much service for the history of ideas in these later periods as the publication of the canonical books has already been for the earlier period to which they refer. The Pali books written in Ceylon, Burma and Siam will be our best and oldest, and in many respects our only, authorities for the sociology and politics, the literature and the religion, of their respective countries

PALIMPSEST. The custom of removing writing from an inscribed surface, and thus preparing that surface to receive another text, is an old one The term palimpsest (from Gr πάλιν, again, and ψάω, I scrape) is used by Catullus and Cicero, referring, respectively, to papyrus (?) and waxen tablets, and by Plutarch, who tells of Plato comparing Dionysius to a βιβλίον παλίμψηστον, as his tyrant nature, being δυσέκπλυτος, showed like imperfectly erased writing The reference here is clearly to washing writing off papyrus Παλίμψηστος can only at first have been applied to mss of a material strong enough to bear actual scraping or rubbing, as at first to waxen tablets and vellum books. There are still some tablets surviving with traces of earlier writing under a fresh layer of wax. Papyrus could not be scraped or rubbed; writing was sponged from it This could not be very cleanly done, so the material was only re-used for unimportant

documents Earlier writing is seldom detected in extant papyri no doubt because of the abundant supply of that material.

In the early period of palimpsests, vellum mss. were washed, not scraped. In course of time, *e.g.*, by atmospheric action, the original writing would partly reappear; thus many capital and uncial palimpsests have been successfully deciphered. In the later middle ages vellum surface was scraped away; the reading of the later examples is therefore often impossible. Besides actual rasure, there were various recipes for effacing writing, *e g*, to soften the surface with milk and meal, and then to rub with pumice. To bring out the original writing various chemical reagents have been tried. The old method of smearing with tincture of gall ultimately rendered the text illegible Of modern reagents the most harmless appears to be hydrosulphate of ammonia; but this also needs caution.

The custom of re-using vellum mss. arose primarily from dearth of material In the case of Greek mss so great was the consumption of old codices that a synodal decree (A D 691) forbade the destruction of intact mss of the Scriptures or the church Fathers The decline of the vellum trade on the introduction of paper intensified the scarcity. Vast destruction of the broad quartos of the early centuries of our era took place after the fall of the Roman empire, so the most valuable Latin palimpsests are found in volumes remade from the 7th to the 9th centuries No entire work has been found in the original text of a palimpsest, but portions of many works were used to form a volume This proves that scribes made use of any suitable material available

An enumeration of the different palimpsests of value is not here possible (*see* Wattenbach, *Schriftwesen*, 3rd ed pp. 299–317); but a few may be mentioned of which facsimiles are accessible. The ms in the Bibliothèque Nationale, Paris, known as the Codex Ephraemi, containing portions of the O. and N testaments in Gr. (? 5th century) is covered with works of Ephraem Syrus in a hand of the 12th century (ed. Tischendorf, 1843, 1845). Among the Syriac mss from the Nitrian desert in Egypt, now in the British Museum, some important texts have been recovered. A volume containing a work of Severus of Antioch of the 9th century is written on palimpsest leaves taken from mss of the *Iliad*, and the Gospel of St Luke, both of the 6th century (*Cat Anc Mss* vol i pls. 9, 10), and the *Elements* of Euclid of the 7th or 8th century. To the same collection belongs the double palimpsest, in which a text of St John Chrysostom, in Syriac, of the 9th or 10th century covers a Latin grammatical treatise of the 6th century, which in its turn has displaced the Latin annals (5th century) of Granius Licinianus For Latin palimpsests also *see* the *Exempla* of Zangemeister and Wattenbach By using skill and judgment, photography may be often made a useful agent in the decipherment of obscure palimpsest texts

PALINDROME, a verse or sentence which runs the same when read either backwards or forwards Such is the verse—

Roma tibi subito motibus ibit amor

Some have refined upon the palindrome and composed verses each word of which is the same read backwards as forwards; for instance, that of Camden:—

Odo tenet mulum, madidam mappam tenet Anna,
Anna tenet mappam madidam, mulum tenet Odo

The following is still more complicated, as it can be read in four ways—upwards and downwards as well as backwards and forwards:—

S A T O R
A R E P O
T E N E T
O P E R A
R O T A S

PALINGENESIS, a term used in philosophy, theology and biology (Gr πάλιν, again, γένεσις, becoming, birth). In philosophy it denotes in its broadest sense the theory (*e g*, of the Pythagoreans) that the human soul does not die with the body but is "born again" in new incarnations. It is thus the equivalent of metempsychosis (*q.v.*). The term has a narrower and more specific use in the system of Schopenhauer, who applies it to his doctrine that the will does not die but manifests itself afresh in new individuals. He thus repudiates the primitive metempsychosis doctrine which maintains the reincarnation of the particular soul. The word "palingenesis" or rather "palingenesia" may be traced back to the Stoics, who used the term for the continual re-creation of the universe by the Demiurgus (Creator) after its absorption into himself Similarly Philo speaks of Noah and his sons as leaders of a "renovation" or "re-birth" of the earth. Josephus uses the term of the national restoration of the Jews, Plutarch of the transmigration of souls, and Cicero of his own return from exile In the New Testament the properly theological sense of spiritual regeneration is found, though the word itself occurs only twice; and it is used by the church Fathers, *e g*, for the rite of baptism or for the state of repentance In modern biology "palingenesis" has been used for the exact reproduction of ancestral features by inheritance, as opposed to "kenogenesis" (Gr. καινός, new), in which the inherited characteristics are modified by environment

PALISSY, BERNARD (1510–1589), French potter (*see* CERAMICS), is said to have been born about 1510, either at Saintes or Agen, and died in Paris in 1589 It has been stated, on insufficient authority, that his father was a glass-painter and that he served as his father's apprentice He tells us that he was apprenticed to a glass-painter and that he also acquired the elements of land-surveying At the end of his apprenticeship he became a travelling workman; acquiring knowledge in many parts of France and the Low Countries, perhaps even in the Rhine Provinces of Germany and in Italy

About 1539 he settled at Saintes At this time he was shown a white enamelled cup which so pleased him that he determined—to use his own expressive phrase "like a man who gropes in the dark"—to discover the secrets of its manufacture Most writers have supposed that this cup was a piece of the enamelled majolica of Italy, but it is more likely that it was a specimen of Chinese porcelain, then one of the wonders of the European world First Palissy mastered the rudiments of peasant pottery. Other equipment he had none, except such information as he presumably had acquired of the manufacture of European tin-enamelled pottery

For nearly 16 years Palissy laboured on through a succession of utter failures At times he and his family were reduced to poverty, he burned his furniture and even, it is said, the floor boards of his house to feed his furnaces All these struggles and failures are recorded by Palissy in his simple and interesting autobiography The tragedy is that Palissy not only failed to discover the secret of Chinese porcelain, but that when he did succeed in making the special type of pottery that will always be associated with his name it should have been inferior technically to the contemporary productions of Spain and Italy His first successes can only have been a superior kind of "peasant pottery" decorated with modelled or applied reliefs coloured naturalistically with glazes and enamels These works had already attracted attention when, in 1548, the constable de Montmorency was sent into the Saintonge to suppress the revolution there Montmorency protected the potter and found him employment in decorating with his glazed terra-cottas the château d'Ecouen This patronage brought Palissy into fame at the French court His workshops and kilns were destroyed, but he was saved, and appointed "inventor of rustic pottery to the king and the queen-mother"; about 1563, under royal protection, he was allowed to establish a pottery works in Paris near the palace of the Louvre For about 25 years Palissy lived and worked in Paris as a personal favourite of Catherine de' Medici, and of her sons.

His productions passed through many phases He made a large number of dishes and plaques ornamented with scriptural or mythological subjects in relief, and also reproductions of the pewter dishes and ewers of François Briot and other metal workers of the period During this period he gave public lectures on natural history. His ideas of springs and underground waters were far in advance of the general knowledge of his time. He was one of the first to enunciate the correct theory of fossils

The close of Palissy's life was in keeping with his active and stormy youth. In the fanatical outburst of 1588 he was thrown into the Bastille He was condemned to death when nearly 80

years of age, but he died in one of the dungeons of the Bastille in 1589.

Palissy's Pottery.—The technique of his various wares shows their derivation from the ordinary peasant pottery of the period, though Palissy's productions are vastly superior to anything of their kind previously made in Europe. It appears almost certain that he never used the potter's wheel, as all his best known pieces have evidently been pressed into a mould and then finished by modelling or by the application of ornament moulded in relief. His most characteristic productions are the large plates, ewers, oval dishes and vases to which he applied realistic figures of reptiles, fish, shells, plants and other objects. Casts from these were fixed on to a metal dish or vase of the shape required, and a fresh cast of the whole formed a mould from which Palissy could reproduce many copies. The various parts were painted in realistic colours of various shades of blue from indigo to ultramarine, some rather vivid greens, several tints of browns and greys, and, more rarely, yellow. The authentic Palissy productions excel in the sharpness of their modelling, in a perfect neatness of manufacture and in the subdued richness of their general tone of colour. The marbled colours on the backs of the dishes in Palissy's work is soft and well fused, in the imitations it is generally dry, even harsh and uneven.

Another class of designs used by Palissy were plates, *tazze* and the like, with geometrical patterns moulded in relief and pierced through, forming open network. A few enamelled earthenware statuettes have been attributed to him; but it is doubtful whether he ever worked in the round. His productions have always been highly valued, and in the 17th century attempts were made, both at Delft and Lambeth, to adapt his "rustic" dishes with the reliefs of animals and human figures. These imitations are very blunt in modelling and coarsely painted. They are generally marked on the back in blue with initials and a date—showing them to be honest adaptations to a different medium, not attempts at forgery. Between 1840 and 1870, copies of Palissy's "Bestiole" dishes were made with great skill and success by Avisseau of Tours, and afterwards by Pull of Paris. The well-known potter, Barbizet, who set out to make "Palissys" for the million, flooded France with rude copies that should never have deceived anyone.

The best collections of Palissy's ware are those in the museums of the Louvre, the Hôtel Cluny, and Sèvres; and in England those in the Victoria and Albert museum, the British Museum and the Wallace Collection.

Palissy wrote with vigour and simplicity on a great variety of subjects, such as agriculture, natural philosophy, religion and especially in his *L'Art de terre,* where he gives an account of his processes and how he discovered them.

See Delecluze, *B. Palissy* (1838); Marryat, *Pottery* (1850, pp. 31 *seq.*); A. Dumesnil, *B. Palissy, le potier de terre* (1851); Morley, *Life of Palissy* (1855); Enjubault, *L'Art céramique de B. Palissy* (1858); H. Delange, *Monographie de l'oeuvre de B. Palissy* (1862); A. Tainturier, *Terres émaillées de Palissy* (1863); Audiat, *Étude sur la vie . . . de B. Palissy* (1868). For Palissy as a Huguenot, *see* Rossignol, *Des Protestantes illustres,* No. iv. (1861). The best English account of Palissy as a potter is that given by M. L. Solon in his *History and Description of the Old French Faïence* (1903).

PALITANA, a native state of India in the Western India States agency of the Bombay presidency. Area, 290 sq.m.; pop. (1921) 57,929. The chief is a Gohel Rajput, with the title of Thakur Sahib. Tribute jointly to the gaekwar of Baroda and the nawab of Junagarh, £700. The state is noted for its horses and horse-breeding. The chief products are grain, sugar and cotton. The capital of the state is Palitana (pop. 12,890), on the Bhaunagar railway. Above the town to the west rises the hill of Satrunja, sacred to the Jains. On this hill, all the peculiarities of Jain architecture are found in a marked degree. Some of the temples are as old as the 11th century. The hill is visited by crowds of pilgrims every year.

PALK STRAITS, the channel lying between the mainland of India and the island of Ceylon. It is named after Robert Palk, governor of Madras (1755–1763). The straits lie north of the line of reefs called Adam's Bridge, while the Gulf of Manaar lies south of it.

PALLA, PALA or IMPALA, a red South African antelope of the size of a fallow-deer, characterized by the large black lyrate horns of the bucks, and the presence in both sexes of glands on the back of the hind feet bearing a tuft of black hairs. On the east side the palla (*Aepyceros melampus*) ranges as far north as the Southern Sudan; in Angola it is replaced by a species (*Ae. petersi*) with a black "blaze" down the face. Pallas associate in large herds in the neighbourhood of water. (*See* ANTELOPE.)

PALLADIAN, a term applied to any architecture of a rather heavily classic type making a great use of the orders and generally following the grandiose manner of the work of Andrea Palladio (1518–80); especially applied to the later phase of the English Renaissance, introduced into England by Inigo Jones.

A Palladian window or Palladian motive is a combination of three openings in which the central one is crowned by an arch resting on entablatures which cap the smaller side openings and are supported on columns between the openings and pilasters at the sides. This motive is so-called because it was first used on a large scale in Palladio's basilica at Vicenza (1549–1614).

PALLADIO, ANDREA (1518–1580), Italian architect, was born in Vicenza on Nov. 30, 1518. His patron, Count Trissino, took him to study architecture in Rome. In 1547 he returned to Vicenza, where he designed many fine buildings—among the chief being the Palazzo della Ragione, and the Barbarano, Porti and Chieregati palaces. Most of these buildings which Palladio designed to be executed in stone were mainly built of brick, covered with stucco, and are now in a very dilapidated condition. Pope Paul III. called him to Rome to report upon the state of St. Peters. In Venice, Palladio built many stately churches, S. Giorgio Maggiore, the Capuchin church, and some large palaces on the Grand canal. His last great work was the Teatro Olimpico at Vicenza, finished by his pupil and fellow citizen Scamozzi.

Palladio also designed many country villas in northern Italy. The villa of Capra is perhaps the finest of these, and has frequently been imitated. Palladio was a great student of classical literature, and published in 1575 an edition of Caesar's *Commentaries* with notes. His *I quattro libri dell' architettura,* first published at Venice in 1570, has been translated into every European language. The original edition is a small folio, richly illustrated with well-executed woodcuts of plans, elevations and details of buildings. An edition with notes was published in England by Inigo Jones. The classical style adopted and partially invented by Palladio expressed a revolt against the extreme licence both of composition and ornament into which the architecture of his time had fallen. His drawings of ancient buildings are now of great value, as in many cases the buildings have ceased to exist.

See Montanari, *Vita di Andrea Palladio* (1749); Rigato, *Osservazioni sopra Andrea Palladio* (1811); Magrini, *Memorie intorno la vita di Andrea Palladio* (1845); Milizia, *Memorie degli architetti,* ii. 35–54 (1781); Symonds, *Renaissance in Italy—Fine Arts,* pp. 94–99; Zanella, *Vita di Andrea Palladio* (Milan, 1880); Barichella, *Vita di Andrea Palladio* (Lonigo, 1880); B. F. Fletcher, *A. Palladio, his life and works* (1902).

PALLADIUM, an image of Pallas (Athena), especially an archaic wooden image preserved in the citadel of Troy as a pledge of the safety of the city. It was said that Zeus threw it down from heaven when Ilus was founding the city of Ilium, and that Odysseus and Diomedes carried it off from the temple of Athena, thus making the capture of Troy possible. Many cities in Greece and Italy claimed to possess the genuine Trojan Palladium, but especially it was identified with one of the holy objects kept in the *penus* or inner shrine of Vesta at Rome. Its theft is a common subject in Greek art, especially of the early time.

PALLADIUM is a metal always present to some extent in platinum ores, which sometimes consist almost wholly of this metal; it is occasionally, but rarely, found in small amounts in osmiridium and sometimes occurs in small quantities combined with gold in the Harz Mountains. (Symbol Pd, atomic number 46, atomic weight, 106·7.) It is also present in appreciable amounts in most nickel ores, generally associated with a smaller amount of platinum, and in the Mond process of nickel extraction the residues (after removal of nickel) are worked up for platinum

metals, so that considerable quantities of both palladium and platinum are obtained from this source. Palladium was first isolated by Wollaston in 1802, who instead of publishing his discovery in the usual way placed a small amount on sale in London as a new metal, naming it palladium after the recently discovered planet Pallas. An English chemist, Chenevix, examined the substance and concluded that it was merely a platinum amalgam. The matter was cleared up when Wollaston disclosed the source of the metal in a paper in which he also announced the discovery of rhodium (*Phil. Trans.*, 1804, 428; 1805, 316).

Palladium is readily obtained in the pure state by several methods. It alone of the platinum metals forms an insoluble cyanide; in ordinary treatment, after most of the osmium, iridium and ruthenium have been removed, the solution containing platinum, palladium and rhodium is neutralized and precipitated with mercuric cyanide (alkaline cyanides are not so suitable, as soluble double cyanides are formed), palladium cyanide, $Pd(CN)_2$, being precipitated, which on simple ignition yields pure palladium. Another method of separating palladium is to add to a nearly neutral solution a large excess of ammonia. To the clear solution hydrochloric acid is added in excess when sparingly soluble palladosammine chloride, $Pd(NH_3)_2Cl_2$, is slowly precipitated, which on ignition gives pure spongy palladium. Palladium is a whitish metal very similar in appearance to platinum, it is malleable and ductile and has a specific gravity of about 11·5. It melts more readily than any other of the platinum metals, fusing at 1,549° C and being easily volatilized in an electric furnace. Palladium sponge is produced by ignition either of the cyanide or palladosammine chloride or ammonium palladium chloride $(NH_4)_2PdCl_4$; palladium black is obtained by reduction of any of its salts in solution by formic acid. A stable black colloidal solution of palladium is produced by reducing with hydrazine hydrate a solution of palladous chloride in the presence of a protective colloid, or in a less stable colloidal solution by passing an arc between palladium terminals under water containing a trace of caustic soda. Palladium differs from other platinum metals in being readily soluble in strong nitric acid, especially when this contains lower oxides of nitrogen. In the finely divided state of palladium black it is soluble even in hydrochloric acid. It is readily attacked by fusion with caustic alkalis, and when heated in a current of air or oxygen is said to form the lowest oxide, PdO. It is attacked by fluorine at the ordinary temperature and at a dull red heat by chlorine; on heating it combines directly with sulphur.

A very remarkable property of palladium is its power of absorbing hydrogen. Graham showed that a palladium wire at a dull red heat was capable of absorbing 935 times its volume of hydrogen, thereby increasing in length by 1·6% or in bulk by just over 4%. Another experiment gave an increase in bulk of nearly 10%. The maximum amount of hydrogen absorbable by palladium is roughly represented by the formula Pd_2H, and it was at one time supposed that a definite compound was formed. This, however, has now been completely disproved chiefly by the work of Silverts and his co-workers (1911), who have shown that the amount of hydrogen absorbed is a function of both temperature and pressure and that above 138° C the amount of hydrogen absorbed is a constant agreeing closely with the formula $T\times\sqrt{P}$ (T=temperature, P=pressure). Hence the composition of the substance is variable and it cannot be a true compound. This property of palladium is shared but to a much smaller extent by other allied metals, *e.g.*, the platinum group, nickel, iron, copper and tantalum, and it is on this property that the catalytic reduction by hydrogen of many substances depends, for the hydrogen molecule, H_2, appears to be dissociated into two atoms when in this condition and thus becomes enormously more reactive (*see* CATALYSIS). Owing to this property also, hydrogen is capable of diffusing through sheets of these metals at a high temperature.

Three oxides of palladium are known, Pd_2O, PdO and PdO_2; of these the first is unimportant but the others are basic and give rise to the formation of two series of salts closely analogous to the corresponding platinum compounds, but the palladic salts are less stable than the corresponding platinic ones. *Palladous chloride,* $PdCl_2$, formed by the action of chlorine at a dull red heat upon the metal or upon the sulphide PdS, or by the action of hot dilute aqua regia or a mixture of hydrochloric acid and chlorine upon the finely divided metal, crystallizes in reddish-brown crystals with two molecules of water. It combines readily with chlorides of the alkali metals giving double chlorides of the composition M_2PdCl_4. A solution of $PdCl_2$ readily absorbs carbon monoxide, yielding definite compounds. This reaction is used in analysis as a method of determining carbon monoxide in gaseous mixtures. *Palladic chloride,* $PdCl_4$, is prepared by dissolving the metal in cold strong aqua regia, when palladichloric acid, H_2PdCl_6, is formed. The simple chloride can be prepared in solution by the action of chlorine upon palladous chloride or by dissolving palladic oxide, PdO_2, in strong hydrochloric acid. The chloride combines easily with alkaline chlorides giving palladichlorides of the composition M_2PdCl_6. *Palladous iodide,* PdI_2, is formed by precipitating a solution of any palladous salt with potassium iodide, as a black flocculent precipitate soluble in excess of the reagent to a cherry-red solution.

Palladous sulphide, PdS, precipitated from solutions of palladous salts by sulphuretted hydrogen, is also formed by heating the metal in sulphur vapour; it is insoluble in yellow ammonium sulphide. *Palladic sulphide,* PdS_2, can be prepared by dry methods only, such as by fusing the lower sulphide with a mixture of sulphur and sodium carbonate. Palladium salts combine with ammonia in two different proportions forming compounds of the types $Pd(NH_3)_2X_2$ (palladosammines) and $Pd(NH_3)_4X_2$ (palladodiammines). Compounds of the former group are stable but those of the latter group easily lose ammonia and pass into the lower compounds. The ordinary salts of both series are well known and the water-soluble hydroxides of both behave as strong bases.

The uses to which palladium has been put are many and various. It is frequently used in astronomical and other instruments of precision as the basis of graduated surfaces on account of its unalterability and comparative lightness. It is also used for coating silver goods, for it is not affected by sulphuretted hydrogen as is silver, and is sometimes deposited on glass for the production of permanent mirrors. Palladium is used to a certain extent in dentistry, and during the World War considerable quantities were used for jewellery as platinum was then unobtainable. It is being used more and more in various aeroplane parts. The yellow colour of gold is destroyed by alloying it with small quantities of platinum or palladium; the product, white gold, is extensively used for jewellery. The whitening effect of palladium in gold is considerably greater than that of platinum. Palladium is sometimes used for the springs of clocks and watches, for it has the advantage over steel of not being magnetised under any conditions. During the World War, when platinum was controlled and practically unpurchasable, attempts were made to use palladium instead of platinum in the manufacture of sulphuric acid. This was only partly successful; when the exact conditions were found, palladium was just as efficient as platinum, but slight alteration from the perfect conditions caused a great falling-off in efficiency. (F. E. M.)

PALLAIN, GEORGES (1845–1923), French administrator, after practising as an advocate and occupying the position of sub-prefect, entered the Ministry of Finance and was made director of various important departments in turn, notably of the Customs department. In 1898 he was appointed governor of the Bank of France, a post which he held until his retirement in 1920.

PALLANZA, a town and summer and winter resort of the province of Novara, Piedmont, Italy, 659 ft. above sea-level. Pop. (1912) 5,122 (town); 5,638 (commune). It occupies a position of great natural beauty, on a promontory on the W. of Lago Maggiore, with a semicircle of mountains behind and the lake and Borromean Islands in front, 62 m. N. of Novara.

PALLAS, PETER SIMON (1741–1811), German naturalist and traveller, was born in Berlin on Sept. 22, 1741, the son of Simon Pallas, a surgeon. He studied medicine at Berlin, Halle, Göttingen and Leyden, and showed a leaning towards natural history. In 1761 he went to England, where he devoted himself to a geological investigation of part of the coast; and

at the age of twenty-three he was elected a foreign member of the Royal Society. In 1768 he became professor of natural history at the Imperial Academy of Science, St. Petersburg, and was appointed naturalist to a scientific expedition through Russia and Siberia, to observe the transit of Venus in 1769. Pallas went by Kazan to the Caspian, and journeyed across to China. In 1793–1794 he visited the southern provinces of Russia, and determined to settle in the Crimea. The empress gave him an estate at Simpheropol and 10,000 roubles to assist in equipping a house. He continued to live in the Crimea, devoted to research in botany, till the death of his second wife in 1810, when he moved to Berlin, where he died on Sept. 8, 1811.

His works include: *Elenchus Zoophytorum* (Hague, 1766); *Miscellanea Zoologica* (Hague, 1866); *Spicilegia Zoologica* (Berlin, 1767–1804); *Reisen durch Verschiedene Provinzen des rüssischen Reichs* (3 vols., St. Petersburg 1771–76); *Sammlungen historischer Nachrichten über die mongolischen Völkerschaften* (2 vols., 1776–1802); *Novae Species quadrupedum* (1778–79); *Icones insectorum praesertim Rossiae Siberiaeque pecularium* (1781–1806); *Zoographia rossoasiatica* (3 vols., 1831); *Bemerkungen auf einer Reise durch die sudlichen Statthalterschaften des russischen Reichs* (Leipzig, 1799–1801).

See the essay of Rudolphi in the *Transactions* of the Berlin Academy for 1812; Cuvier's Eloge in his *Recueil des éloges historiques,* vol. ii.; and the Life in Jardine's *Naturalists' Library,* vol. iv. (Edin., 1843).

PALLAVICINO, FERRANTE (1618–1644), Italian writer of pasquinades, a member of the old Italian family of the Pallavicini, was born at Piacenza in 1618. He entered the Augustinian order, residing chiefly in Venice. For a year he accompanied Ottavio Piccolomini, duke of Amalfi, in his German campaigns as field chaplain, and shortly after his return he published a number of clever but exceedingly scurrilous satires on the Roman curia and on the powerful house of the Barberini, which was so keenly resented at Rome that a price was set on his head. A Frenchman, Charles de Breche, decoyed him from Venice to the neighborhood of Avignon, and there betrayed him. After fourteen months' imprisonment he was beheaded at Avignon on March 6, 1644.

His *Opere permesse* was published at Venice in 1655, but being, as may be imagined, inferior in scurrility and grossness (Pallavicino's specialties), are much less prized by the curious than the *Opere scelte* (Geneva, 1660), which were more than once reprinted in Holland, and were translated into German in 1663.

PALLAVICINO (or Pallavicini), **PIETRO SFORZA** (1607–1667), Italian cardinal and historian, son of the Marquis Alessandro Pallavicino of Parma, born at Rome, joined the Society of Jesus in 1638. As professor of theology in the Roman College he was a member of the congregation appointed by Innocent X. to investigate the Jansenist heresy. In 1659 he was made a cardinal by Alexander VII. He died at Rome on June 5, 1667. Pallavicino is chiefly known by his history of the council of Trent, written in refutation of Paolo Sarpi (*q.v.*) in Italian, and published at Rome in two folio volumes in 1656–1657. In this he continued the task begun by Terenzio Alciati. The work was translated into Latin by a Jesuit named Giattinus (Antwerp, 1670–1673), and into German by Klitsche in 1835–1837.

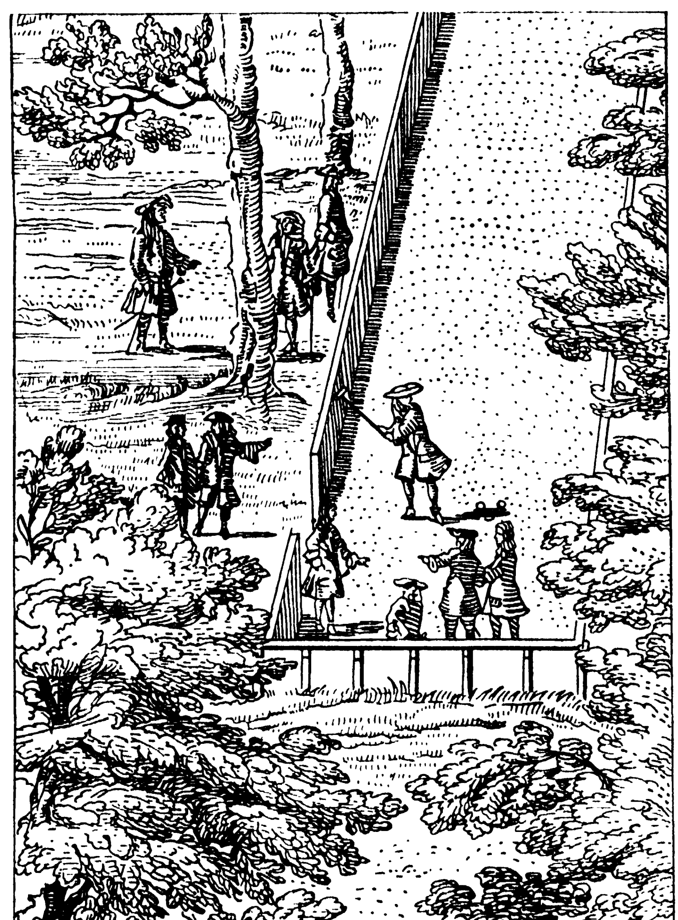
His collected *Opere* were published in Rome in 1844–1848.

PALLIUM or Pall, an ecclesiastical vestment in the Roman Catholic Church, originally peculiar to the pope, but for many centuries past bestowed by him on all metropolitans, primates and archbishops as a symbol of the jurisdiction delegated to them by the Holy See. The pallium, in its present form, is a narrow band, "three fingers broad," woven of white lamb's wool, with a loop in the centre resting on the shoulders over the chasuble, and two dependent lappets, before and behind; so that when seen from front or back the ornament resembles the letter Y. It is decorated with six purple crosses, one on each tail and four on the loop, is doubled on the left shoulder, and is garnished, back and front, with three jewelled gold pins. The two latter characteristics seem to be survivals of the time when the Roman *pallium* was a simple scarf doubled and pinned on the left shoulder.

The papal *pallia* were at one time made of white linen (*see* Johannes Diaconus, *Vita S. Gregorii M. lib. IV.* cap. 8, *pallium eius bysso candente contextum*). The right to wear the pallium seems, in the first instance, to have been conceded by the popes merely as a mark of honour. The first recorded example of the bestowal of the pallium by the popes is the grant of Pope Symmachus in 513 to Caesarius of Arles, as papal vicar. Every archbishop must apply for it, personally or by deputy, within three months after his consecration, and it is buried with him at his death (*see* Archbishop). Though the pallium is thus a vestment distinctive of bishops having metropolitan jurisdiction, it may only be worn by them within their jurisdiction, on certain solemn occasions. The pope alone has the right to wear everywhere and at all times a vestment symbolizing the fullness of ecclesiastical power.

Hinschius, *Kirchenrecht*, II. 23 *sqq.*; Gresar, "Das römische Pallium und die ältesten liturgischen Schärpen" (in *Festschrift zum elfhundertjährigen Jubiläum des campo santo in Rom,* Freiburg, 1897); Du Cange, *Glossarium s.v.* "Pallium", Joseph Braun, *Die liturgische Gewandung im Occident und Orient* (Freiburg-i.-B., 1907); *Catholic Encyclopaedia, s.v.* "Pallium."

PALL-MALL, an obsolete English game of French origin, resembling croquet, called in France *paille-maille* (from *palla,* ball, and *malleus,* mallet). Thomas Blount's *Glossographia* (ed. 1670) describes it as follows: "Pale Maille, a game wherein a round bowle is with a mallet struck through a high arch of iron (standing at either end of an alley) which he that can do at the fewest blows, or at the number agreed on, wins. This game was heretofore used in the long alley near St. James's and vulgarly



FROM "KEY'S PROSPECT"

VIEW OF PALL-MALL ALLEY, SHOWING A GAME BEING PLAYED IN THE 17TH CENTURY. TAKEN FROM AN OLD BOOK OF WOODCUTS

called Pell-Mell." The pronunciation here described as "vulgar" afterwards became classic, a famous London street having been named after a Pall Mall alley. A mallet and balls used in the game were found in 1845 and are now in the British Museum.

PALLONE (Italian for "large ball," from *palla,* ball), the national ball game of Italy. It is descended as are all other court games, such as tennis and pelota, from the two ball games played by the Romans, in one of which a large inflated ball, called *follis,* was used. The other, probably the immediate ancestor of pallone, was played with a smaller ball, the *pila.* Pallone was played in

Tuscany as early as the 14th century and is still very popular in northern and central Italy. It is played in a court (*sferisterio*), usually 100 yds. long and 17 yds. wide. A white line crosses the middle of the court, which is bounded on one side by a high wall, the spectators sitting round the other three sides, usually protected by wire screens. One end of the court is called the *battuta*, and the other the *ribattuta*. At the end of the *battuta* is placed a spring-board, upon which stands the player who receives the service. The implements of the game are the *pallone* (ball) and the *bracciale* (bat). The *pallone* is an inflated ball covered with leather, about 4⅜in. in diameter. The *bracciale* is an oak gauntlet, tubular in shape, and covered with long spike-like protuberances. It weighs between five and six pounds and is provided with a grip for the hand. The game is played by two sides—blues and reds —of three men each, the *battitore* (batter), *spalla* (back) and *terzino* (third). At the beginning of a game the *battitore* stands on the spring-board and receives the ball thrown to him on the bound by a seventh player, the *mandarino*, who does duty for both sides. The batter may ignore the ball until it comes to him to his liking, when he runs down the spring-board and strikes it with his *bracciale* over the centre line towards his opponents. The game then proceeds until a player fails to return the ball correctly, or hits it out of bounds, or it touches his person. This counts a point for the adversary. Four points make a game, counting 15, 30, 40 and 50.

See G. Franceschini, *Il Giuoco del pallone* (1903).

PALM, originally the flat of the hand, in which sense it is still used; from this sense the word was transferred as a name of the trees described below. The emblematic use of the word (=prize, honour) represents a further transference from the employment of the palm-leaves as symbols of victory.

The palms, botanically Palmae or Palmaceae, have been termed the princes of the vegetable kingdom. Neither the anatomy of their stems nor the conformation of their flowers, however, entitles them to such position, but in general character they are noble plants. Their stems are not more complicated in structure than those of the common butcher's broom (*Ruscus*); their flowers are for the most part as simple as those of a rush (*Juncus*). The family Palmaceae is characterized among monocotyledonous plants by the presence, for the most part, of an unbranched stem bearing a tuft of leaves at the extremity only, or with the leaves scattered; these leaves, often gigantic in size, are usually firm in texture and branching in a pinnate or palmate fashion. The flowers are borne on simple or branching spikes, very generally protected by a spathe or spathes, and each consists typically of a perianth of six greenish somewhat inconspicuous segments in two rows, with six stamens, or pistil of one to three carpels, each with a single ovule and a succulent or dry fruit, never dehiscent. The seed consists almost exclusively of endosperm or albumen in a cavity in which is lodged the relatively very minute embryo. Some of the more important modifications may be noticed briefly.

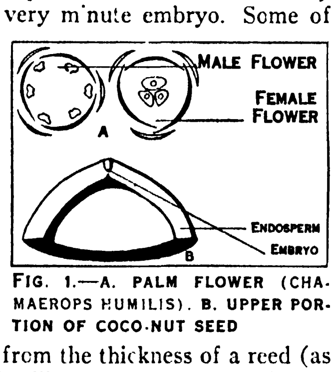


FIG. 1.—A. PALM FLOWER (CHAMAEROPS HUMILIS). B. UPPER PORTION OF COCO-NUT SEED

Taking the stem first, it is in very many palms relatively tall, erect, unbranched, regularly cylindrical, or dilated below so as to form an elongated cone, either smooth, or covered with the projecting remnants of the former leaves, or marked with circular scars indicating the position of those leaves which have now fallen away. It varies in diameter from the thickness of a reed (as in *Chamaedorea*) to a sturdy pillar-like structure as seen in the date-palm, Palmyra palm or Talipot. In other cases the very slender stem is prostrate, or scandent by means of formidable hooked prickles which, by enabling the plant to support itself on the branches of neighbouring trees, also permit the stem to grow to a very great length and so to expose the foliage to the light and air above the tree-tops of the dense forests, as in the genus *Calamus*, the rattan or cane palms (*see* LIANES). In some examples the trunk, or that portion of it above ground, is so short that the plant is in a loose way called "stemless," as in some kinds of the Sabal tribe, and as happens sometimes in the only species found in a wild state in Europe, *Chamaerops humilis*. The vegetable ivory (*Phytelephas*) of equatorial America has a very short thick stem bearing a tall cluster of leaves which appears to rise from the ground. In many species the trunk is covered with a dense network of stiff fibres, often compacted together at the free ends into spines. This material, which is so valuable for cordage, consists of the fibrous tissue of the leaf-stalk, which in these cases persists after the decay of the softer portions. It is very characteristic of some palms to produce from the base of the stem a series of adventitious roots which gradually thrust themselves into the soil and serve as buttresses to steady the tree and prevent its overthrow by the wind. The underground stem of some species, *e.g.*, of *Calamus*, is a rhizome, or root-stock, lengthening in a more or less horizontal manner by the development of the terminal bud, and sending up lateral branches like suckers from the root-stock, which form dense thickets of cane-like stems. The branching of the stem above ground is unusual; however, in the Doum palm of Egypt (*Hyphaene*), the stem forks, often repeatedly; this is due to the development of a branch to an equal strength with the main stem.

FIG. 2.—RATTAN PALM (DAEMONOROPS DRACO)
A. Young shoot (much reduced). B. Part of stem bearing male inflorescence, C. Part of female inflorescence, D. Ripe fruits

The internal structure of the stem does not differ fundamentally from that of a typical monocotyledonous stem; the taller, harder trunks owe their hardness not only to the fibrous or woody skeleton but also to the fact that, as growth goes on, the originally soft cellular tissue through which the fibres run becomes hardened by the deposit of woody matter within the cells, so that the cellular portions become as hard as the woody fibrous tissue.

The leaves of palms are arranged either at more or less distant intervals along the stem, as in the canes (*Calamus, Daemonorops*) or are approximated in tufts at the end of the stem, thus forming those noble crowns of foliage which are so closely associated with the general idea of a palm. In the young condition, while still unfolded, these leaves form "the cabbage," in some species highly esteemed for food.

The adult leaf generally presents a sheathing base tapering upwards into the stalk or petiole, and this again bears the lamina or blade. The sheath and the petiole often bear stout spines, as in the rattan palms; and when, in course of time, the upper parts of the leaf decay and fall off, the base of the leaf-stalk and sheath often remain, either entirely or in their fibrous portions only, which latter constitute the investment to the stem already mentioned. In size the leaves vary within very wide limits, some being only a few inches in extent, while those of the noble *Corypha* may be measured in tens of feet. In form the leaves of palms are rarely simple; usually they are more or less divided, sometimes, as in *Caryota*, extremely so. Usually the leaves branch regularly in a palmate fashion as in the fan-palms *Latania, Borassus, Chamaerops, Sabal*, etc., or in a pinnate fashion as in the feather-palms, *Areca, Kentia, Calamus, Daemonorops* (fig. 2), etc. The form of the segments is generally more or less linear, but a very distinct appearance is given by the broad wedge-shaped leaflets of such palms as *Caryota* and *Martinezia*. These forms run one into another by transitional gradations; and even in the same palm the form of the leaf is often very unlike at different stages of its

growth. The leaves are sometimes invested with hairs or spines; and, in some cases the under-surface is of a glaucous white or bluish colour, from a coating of wax.

The inflorescence of palms consists generally of a more or less fleshy spike, either simple or much branched, studded with numerous, sometimes extremely numerous, flowers, and enveloped by one or more sheathing bracts called "spathes." These parts

FIG. 3.—A. BETEL NUT OR ARECA PALM (ARECA CATECHU), OF ASIA. B. FLOWERING BRANCH, WITH MALE FLOWERS ABOVE AND FEMALE FLOWERS BELOW. C. A RIPE FRUIT. D. VERTICAL SECTION OF FRUIT

may be small, or they may attain relatively enormous dimensions, hanging down from amid the crown of foliage, or under the crown, like huge tresses, and adding greatly to the effect of the leaves. In some cases, as in the Talipot palm, the tree flowers only once, develops a huge inflorescence, and after the fruit has ripened, dies.

The individual flowers are usually small, greenish and insignificant in appearance; their general structure has been mentioned already. Modifications from the typical structure arise from difference of texture, and specially from suppression of parts, in consequence of which the flowers are often unisexual, though the flowers of the two sexes are generally produced on the same tree (monoecious), not indeed always in the same season, for a tree in one year may produce male flowers and in the next female flowers. In a few cases they are dioecious. Sometimes the flowers are modified by an increase in the number of parts; thus the usually six stamens may be represented by 12 to 24 or even by hundreds. There are usually three carpels, more or less combined.

Owing to the arrangements already mentioned, the pollen has to be transported by the wind or insects to the female flowers. This is facilitated sometimes by the elastic movements of the stamens and anthers, which liberate the pollen so freely at certain times that travellers speak of the date-palms of Egypt (*Phoenix dactylifera*) being at daybreak hidden in a mist of pollen grains. In other cases fertilization is effected by the agency of man, who removes the male flowers and scatters the pollen over the fruit-bearing trees. This practice has been followed in the case of the date from time immemorial.

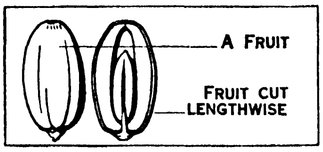

FIG. 4.—FRUIT OF DATE PALM (PHOENIX DACTYLIFERA)

The fruit is various in form, size and character; sometimes, as in the common date, it is a berry with a fleshy rind enclosing a hard stony kernel, the true seed; the fruit of *Areca* is similar; sometimes it is a kind of drupe as in *Acrocomia* (fig. 5), or the coco-nut, *Cocos nucifera,* where the fibrous central portion investing the hard shell corresponds to the fleshy portion of a plum or cherry, while the shell or nut corresponds to the stone of stone-fruits, the seed being the kernel.

The seeds show a corresponding variety in size and shape, but always consist of a mass of endosperm, in which is embedded a relatively very minute embryo. The hard stone of the date is the endosperm, the white oily flesh of the coco-nut is the same substance in a softer condition; the so-called "vegetable ivory" is derived from the endosperm of *Phytelephas.*

The family contains upwards of 170 genera with probably about 1,500 species mainly tropical, but with some representatives in warm temperate regions. *Chamaerops humilis* is a native of the Mediterranean region, and the date-palm yields fruit in southern Europe as far north as 38° N. latitude. In eastern Asia the palms, like other tropical families, extend along the coast reaching Korea and the south of Japan. In America a few small genera occur in the southern United States and California; and in South America the southern limit is reached in *Jubaea spectabile* (the Chile coco-nut) at 37° S. latitude. The great centres of distribution are tropical America and tropical Asia; tropical Africa contains only about a dozen genera, though some of the species, like the doum palm (*Hyphaene thebaica*) and the deleb or palmyra palm (*Borassus flabellifer*) have a wide distribution. With three exceptions Old and New World forms are distinct—the coco-nut (*Cocos nucifera*) is widely distributed on the coasts of tropical Africa, in India and the South Seas, the other species formerly included in the genus being confined to the western hemisphere. The oil palm (*Elaeis guineensis*) is a native of west tropical Africa. *Raphia* has species in both tropical Africa and tropical America.

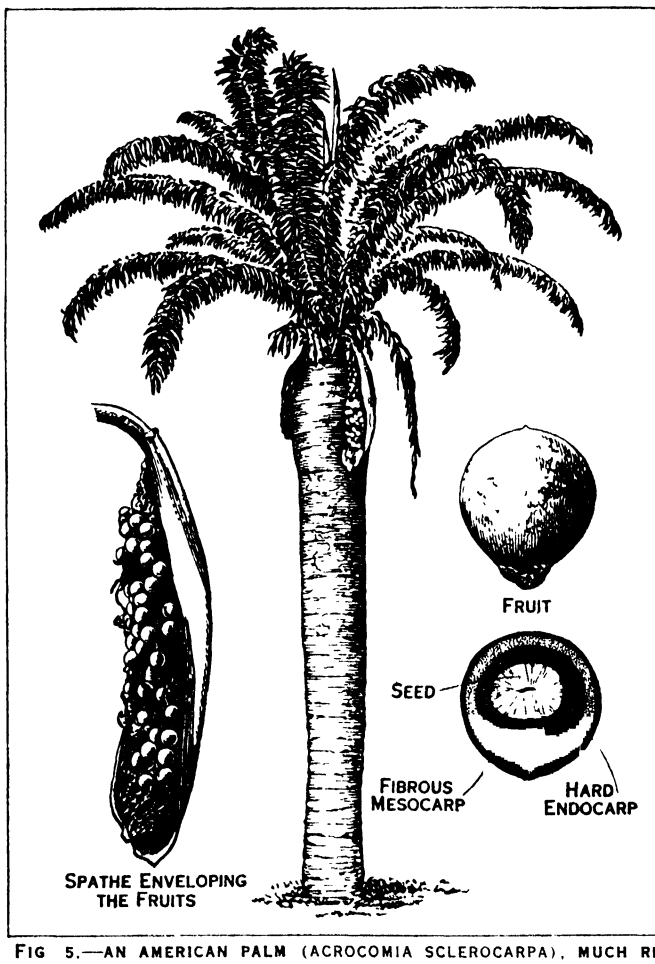

FIG 5.—AN AMERICAN PALM (ACROCOMIA SCLEROCARPA), MUCH REDUCED

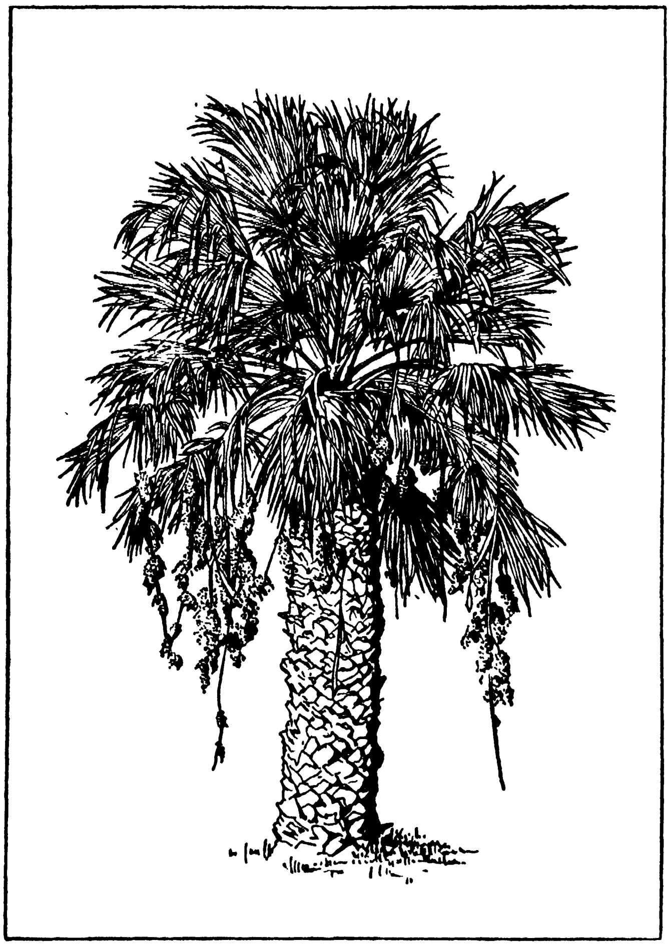
The genera are arranged, according to Drude, in six tribes, distinguished by the nature of the foliage, the sexual conditions of the flower, the character of the seed, the position of the raphe, etc. Other characters serving to distinguish the minor groups are

afforded by the habit, the position of the spathes, the "aestivation" of the flower, the nature of the stigma, the ovary, fruit, etc.

Palms are of the greatest economic importance. They furnish food, shelter, clothing, timber, fuel, building materials, sticks, fibre, paper, starch, sugar, oil, wax, wine, tannin, dyeing materials, resin and a host of minor products, which render them most valuable to the natives and to tropical agriculturists. The coco-



BY COURTESY OF THE UNITED STATES BUREAU OF RECLAMATION

FIG. 6.—A DATE PALM (PHOENIX DACTYLIFERA), A NATIVE OF NORTHERN AFRICA AND SOUTH-WESTERN ASIA

nut palm, *Cocos nucifera,* and the date palm, *Phoenix dactylifera,* are treated in separate articles. Sugar and liquids capable of becoming fermented are produced by *Caryota urens, Cocos nucifera, Borassus flabellifer, Rhapis vinifera, Arenga saccharifera, Phoenix silvestris, Mauritia vinifera,* etc. Starch is procured in abundance from the stem of the sago palm, *Metroxylon,* and others. The fleshy mesocarp of the fruit of *Elaeis guineensis* of western tropical Africa yields, when crushed and boiled, "palm oil." Coco-nut oil is extracted from the oily endosperm of the coco-nut. Wax is exuded from the stem of *Ceroxylon andicolum* and *Copernicia cerifera.* Edible fruits are yielded by the date, the staple food of some districts of northern Africa, and by the pejibaye or Guilielma of tropical America. The coco-nut is a source of wealth to its possessors; and many species, e.g., *Areca sapida* (cabbage-palm and others), are valued for their "cabbage," the terminal bud, whose removal causes the destruction of the tree. The famous "coco de mer," or double coco-nut, whose floating nuts are the objects of so many legends and superstitions, is *Lodoicea malivica.* The tree is peculiar to the Seychelles. Its fruit is like a huge plum, containing a stone or nut like two coconuts (in their husks) united together. *Areca Catechu* is cultivated in tropical Asia for its seeds (reca or betel nuts).

The only species that can be cultivated in the open air in England, and then only under exceptionally favourable circumstances, are the European fan palm, *Chamaerops humilis,* the Chusan palm, *Trachycarpus Fortunei,* etc., and the Chilean *Jubaea spectabilis.* The date palm is commonly planted along the Mediterranean coast. There are several low growing palms, such as *Rhapis flabelliformis, Chamaerops humilis,* etc., which are suited for ordinary green-house culture, and many of which are enabled to resist the dry and often gas-laden atmosphere of living rooms.

For further details, *see* B. Seeman, *History of the Palms* (1856); G. Engler and A. Prantl, *Die Natürlichen Pflanzenfamilien* (Leipzig, 1887–1902); A. B. Rendle, *Classification of the Flowering Plants* (Cambridge, 1925); E. Blatter, *The Palms of British India and Ceylon;* as well as such great works as Martius, *Historia Naturalis . . . Palmarum* in 3 vols., and Barbosa Rodrigues, *Sertum Palmarum Brasiliensium* in 2 vols. (V. H. B.)

American Palms.—The palms native in the continental United States, to which reference has been made above, are 15 or more species; a number of them are as yet imperfectly understood. Most of them are fan-leaved palms. In California one palm is native, the sturdy *Washingtonia filifera;* this plant occurs about the borders of the Colorado desert, in canyons along streams or in seepage places in the open; the same or a similar species has recently been discovered in south-western Arizona. In Texas one species is native near the mouth of the Rio Grande, this being the northern limit, as far as known, of its distribution. It is a striking fan palm, *Sabal texana.* In eastern Texas the dwarf

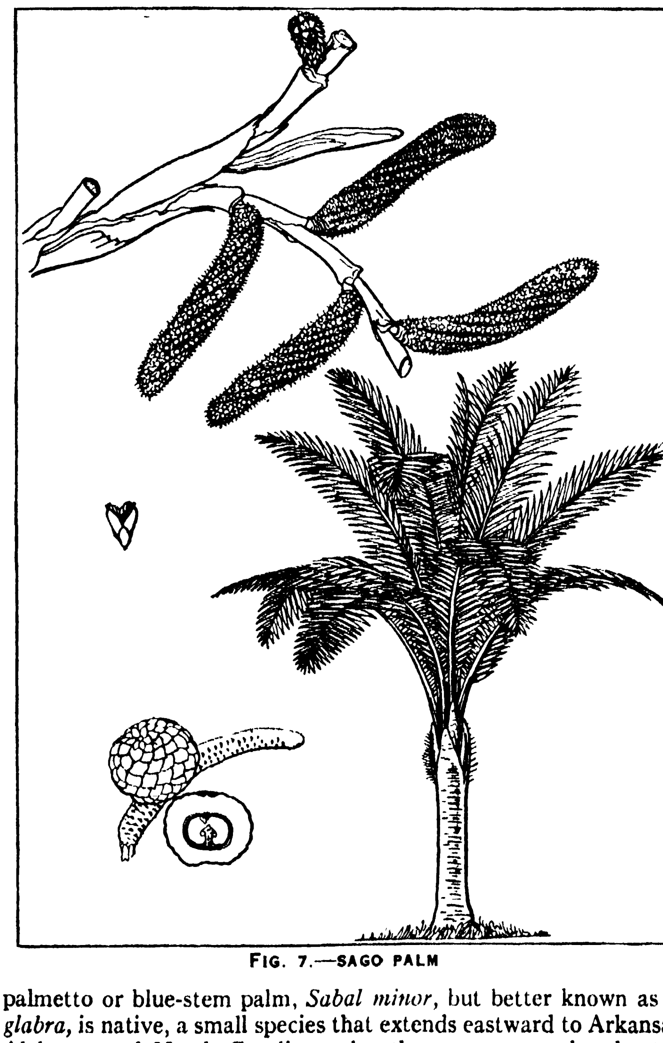


FIG. 7.—SAGO PALM

palmetto or blue-stem palm, *Sabal minor,* but better known as *S. glabra,* is native, a small species that extends eastward to Arkansas, Alabama and North Carolina; also the saw- or scrub-palmetto, *Serenoa repens* (formerly called *S. serrulata*), which covers large areas in pinelands and coastal plain to southern Florida and South Carolina. Another low or scrub palmetto, *Sabal Etonia* (or *S. megacarpa*) is native in peninsular Florida; and there are two tall or tree sabals or palmettos, the common cabbage-tree, *S. Palmetto,* a coastal plant from North Carolina to Florida, but in the peninsular part of the latter state becoming widespread,

and the recently described *S. Deeringiana* of southern Louisiana. The needle-palm, the low *Rhapidophyllum Hystrix,* ranges from Mississippi to Florida and South Carolina; this is a fan-palm known by the long needles in the sheaths at the base of the plant.

All the other palms native in the United States are confined to Florida. They are in five genera, not counting the ubiquitous coconut as native: *Thrinax, Coccothrinax* and *Acoelorraphe* (*Paurotis*), fan-palms; *Pseudophoenix* and *Roystonea* (*Oreodoxa*), feather-palms. All of these plants are confined to the warmer or semi-tropical parts of Florida, practically from the latitude of Miami southward. All may be considered as northern extensions of West Indian species. The *Pseudophoenix* is restricted, in Florida, to a few of the keys of the east coast. *Roystonea* is represented by a single species, the so-called royal palm, native on certain hammocks or islands in the Everglades.

More than 200 species of palms are recorded as planted in the continental United States. A few are known mostly as glasshouse subjects, although probably all are somewhere planted outside in the open or some of them perhaps under lath. They belong to more than 80 genera, as palm botany is now understood, and they represent many countries around the world. For the most part, the planted palms of Florida and California represent unlike sets of species, those in California having a strong Mexican character. (L. H. Ba.)

PALMA, JACOPO (*c.* 1480–1528), Italian painter of the Venetian school. He was born at Serinalta, near Bergamo, and is called Palma Vecchio (Old Palma), to distinguish him from his grandnephew, Palma Giovane, also a painter. He worked mostly in Venice. In his later years his fame spread abroad and he received commissions from Fontanelle near Oderzo, Zerman near Treviso and from Vicenza. He also painted altarpieces in three villages of his native Brembo valley, at Serinalta, Dossena and Peghera. Palma Vecchio appears to have formed his style after Titian and Giorgione; at a later period he was influenced by Lorenzo Lotto. His altarpiece in S. Maria Formosa is famous for the beautiful and majestic figure of St. Barbara on one of its six panels. A favourite subject of the master was "the Santa Conversazione" where the holy family with saints and donors are grouped against an idyllic landscape background, as in the museums of Naples, Vienna, Hampton Court, and in the Lichtenstein collection (Vienna). The fine series of female portraits in the Vienna gallery were probably painted from 1510–20. They represent fair young women of the courtesan type with hair flowing round their bare shoulders. The Berlin gallery and the National Gallery (the Mond collection) contain similar portraits, recalling the well-known Flora, by Titian. At the Dresden gallery is the famous "Three Sisters." Here, too, are "Jacob and Rachel" and "Venus" executed in the broad, blond manner in which he painted towards the end of his life (1520–25). Palma died in 1528 after a long period of illness. He left some 40 uncompleted pictures in his studio which were finished by his pupils; and this circumstance accounts for some inferior work which came into the market under his name.

PALMA, RICARDO (1833–1919), Peruvian man of letters, was born in Lima on Feb. 7, 1833. At the age of 20 he joined the navy, and in 1860 was forced by political exigencies to flee to Chile, where he devoted himself to journalism. Six years later, he returned to Lima, to join a revolutionary movement in favour of war with Spain, and participated in the engagement between the Spanish fleet and the batteries of Callao. In 1881, during the War of the Pacific, he took part in the battle of Miraflores in which the Peruvian forces were defeated, and during the Chilean occupation he had the courage to protest against the vandalistic destruction of the famous National Library by Chilean soldiery. After the war he was for a while director of *La Prensa* in Buenos Aires, but soon was recalled by the Peruvian Government to rebuild the National Library. In 1887 he founded the Peruvian Academy and in 1892 was sent to Spain as Peru's representative to the Fourth Centenary of the Discovery of America. His literary career began in his youth with light verses and translations from Victor Hugo. The *Anales de la inquisición de Lima,* which he had published in periodicals when he was in Chile, appeared in book form in 1863, and this was followed by poems entitled *Semblanzas* (1867) and *Pasionarias* (1870). But his fame chiefly derives from his *Tradiciones,* short prose sketches, mingled fact and fancy, of the colonial days of Peru. The first volume of the series appeared in 1872 as *Tradiciones,* and was succeeded by *Ropa vieja* (1889), *Ropa apolillada* (1891) and an *Apéndice a mis últimas tradiciones.* The best of them have been collected in a single volume, under the title *Las mejores tradiciones peruanas,* one of the most popular books in Spanish-American literature. Palma died in Miraflores, Lima, on Oct. 6, 1919.

PALMA, TOMÁS ESTRADA (1835–1908), patriot and first president of Cuba, was born near Bayamo, Santiago Province, Cuba, on July 9, 1835. He was educated at Havana and at the University of Seville in Spain. When the Ten Years' War (1868–78) was planned, he entered into the patriot plans with great zeal, freeing his slaves and giving his money to the cause of Cuban freedom. He became a general in the revolutionary army, then secretary and finally, in 1876, president of the provisional government which was instituted by the revolutionists. In 1877, however, he was captured by the Spaniards and confined first in El Morro castle and then in Spain until the revolution was suppressed. After his release he went to Honduras, where he married the daughter of the president and became postmaster-general. Later he moved to Orange county, N.Y., where he opened a boys' school, most of the children attending being from Latin-American countries. In 1895, when the Cuban revolution again broke out he went to New York city and became active in the work of the Cuban Junta. After the death of José Martí, Palma became the real head of the revolution. In New York he was active in procuring money, arms and supplies for the revolutionary forces, and was also the informally recognized diplomatic representative of Cuba at Washington. After success had come to the Cubans through the aid of the United States Palma demanded that the United States should ask for nothing less than Cuban independence in the treaty with Spain. In 1901, when the United States was ready to turn the island over to the Cubans, Palma became the first president of the republic by an almost unanimous vote. His rule was honest and intelligent and Cuba was brought to a high degree of prosperity. Palma joined no political party at first and chose a non-partisan cabinet, but he was forced more and more to ally himself with the Conservatives to get his measures through Congress. He allowed himself to become the candidate of the Conservatives for re-election in 1905, an election in which the Conservative bosses probably used fraudulent methods at the polls without Palma's previous knowledge. The Liberals charged a corrupt election and fomented the revolution of 1906, which resulted in the resignation of Palma on Sept. 6, 1906. The United States was forced to take control of the Government temporarily. Palma died in Santiago Province, Cuba, on Nov. 4, 1908.

See R. Martínez Ortiz, *Los primeros años de independencia* (1921); E. Barbarrosa, *El proceso de la república* (1911); C. E. Chapman, *History of the Cuban Republic* (1927).

PALMA or **PALMA DE MALLORCA,** the capital of the Spanish province of the Balearic islands, the residence of a captain-general, an episcopal see, and a flourishing seaport, situated 135 m. S.S.E. of Barcelona, on the south-west coast of Majorca, at the head of the fine Bay of Palma, which stretches inland for about 10 m. between Capes Cala Figuera and Regana. Pop. (1920), 77,418. Palma probably owes, if not its existence, at least its name (symbolized on the Roman coins by a palm branch), to Metellus Balearicus, who in 123 B.C. settled 3,000 Roman and Spanish colonists on the island. The bishopric dates from the 14th century. About 1 m. S.W. of Palma is the castle of Bellver, the ancient residence of the kings of Majorca. The more conspicuous buildings are the cathedral, the exchange, the royal palace, now

occupied by the captain-general, and the law courts, the episcopal palace, a late Renaissance building (1616), the general hospital (1456) and the town-house (end of the 16th century). The cathedral was founded in 1230 and finished in 1601. Palma has a seminary founded in 1700, archives dating from the 14th century, a school and museum of fine arts, a nautical school and an institute founded in 1836 to replace the old university (1503).

The harbour was formed by a mole, 387 yd. long, in the 14th century and has been considerably improved at subsequent intervals. Palma has a thriving trade in grain, wine, oil, almonds, fruit, vegetables, silk, foodstuffs and live stock. There are manufactures of alcohol, liqueurs, chocolate, sugar, flour, soap, leather, earthenware, glass, matches, paper, linen, woollen goods and rugs.

PALMA, or San Miguel de la Palma, a Spanish island in the Atlantic Ocean, forming part of the Canary Islands (*q.v.*). Pop. 52,887; area 280 sq.m. Palma is 26 m. long, with an extreme breadth of 16 m. It lies 67 m. W.N.W. of Teneriffe. It is traversed from north to south by a chain of mountains, the highest of which is 7,900 ft. above sea-level. At the broadest part is a crater 9 m. in diameter, known as the Caldera (*i.e.*, cauldron). The bottom of the crater has an elevation of 2,300 ft., and it is overhung by peaks that rise more than 5,000 ft. above it. Santa Cruz de la Palma (pop. 7,024) on the east coast is the chief town.

PALM BEACH and **WEST PALM BEACH,** two cities of Florida, U.S.A., on the most easterly point of the east coast, 300 m. S.S.E. of Jacksonville. They are on Federal highway 1 and the East Coast Inland waterway, and are served by the Florida East Coast and the Seaboard Air Line railways, and several steamship lines. Palm Beach, on a long narrow island between the Atlantic Ocean and Lake Worth (an arm of the ocean) had a resident population of 1,150 in 1925 (State census). It is one of the most luxurious winter resorts in America, with palatial hotels, clubs and private estates. West Palm Beach, stretching for 12 m. along the opposite side of Lake Worth, is also a pleasure resort and centre for tourists, with many hotels and furnished apartments, and in addition is the county seat of Palm Beach county and the commercial and financial centre of a wide area. Its population in 1928 was estimated locally at 60,000 (25% negroes); transient population of the two cities and their contiguous suburbs ("Greater Palm Beach") in the winter of 1927–28 at about 100,000. Three bridges span the lake, which is usually dotted with yachts, sea-sleds and other small craft, and is the scene of an annual regatta on Feb. 20, 21, and 22. West Palm Beach already has a substantial wholesale distributing trade and ships considerable produce (especially fruits and early vegetables) and its commercial importance will increase with further progress in reclaiming the northern Everglades. Both cities have a commission-manager form of government. The assessed valuation of Palm Beach for 1928–9 was $48,534,624; of West Palm Beach, $98,000,000.

The development of Palm Beach as a winter resort began about 1892. West Palm Beach was incorporated as a town in 1903 and as a city in 1911. In 1900 its population was only 564; in 1910, 1,743; and in 1920, 8,659. In 1924 an extension of the Seaboard Air Line gave connection by rail with the west coast. The Palm Beaches did not suffer from the storm which wrecked Miami in Sept. 1926, but they were badly damaged (to the amount of approximately $30,000,000) by the hurricane of Sept. 1928, which devastated Porto Rico and parts of Florida, especially the Everglades and the south-eastern shores of Lake Okeechobee; and about 13,000 refugees (chiefly from outside the city) were under care of the Red Cross in West Palm Beach for a time. The coco-nut palms fringing Lake Worth, to which the cities owe their name, are the result of the wrecking of a Spanish cargo of coco-nuts off the coast in Jan. 1879.

PALM-CIVET or **PARADOXURE,** the name of the members of the civet-like genus *Paradoxurus*, represented by several species mainly from South-east Asia. (*See* Carnivora.) Palm-civets are about the size of the domestic cat, or rather larger, arboreal in habits, with dark fur. The common Indian palm-civet (*P. niger*) ranges throughout India, wherever there are trees. Its diet consists of small mammals and reptiles, birds and their eggs, fruit and vegetables. From four to six young are brought forth at a litter. Other species occur in Ceylon, the Himalayas and Malay. The small-toothed palm-civets from the Malay Archipelago form the genus *Arctogale*.

PALMELLA, a town of Portugal, in the district of Lisbon at the north-eastern extremity of the Serra da Arrabida, and on the Lisbon-Setubal railway. Pop. (1911), inclusive of the neighbouring village of Marateca, 13,318. Palmella is an ancient and picturesque town, still surrounded by massive but ruined walls and dominated by a mediaeval castle.

PALMER, SIR CHARLES MARK, Bart. (1822–1907), English shipbuilder, was born at South Shields on Nov. 3, 1822. His father, originally the captain of a whaler, removed in 1828 to Newcastle-on-Tyne, where he conducted a ship-owning and ship-broking business. After two years' experience at Marseilles Palmer entered his father's business at Newcastle, and in 1842 he became a partner. He then became a colliery manager, and eventually purchased large colliery interests. Palmer built, largely according to his own plans, the "John Bowes," the first iron screw-collier, and several other steam-colliers, in a yard established by him at Jarrow, then a small Tyneside village. He then purchased iron-mines in Yorkshire, and erected along the Tyne at Jarrow large shipbuilding yards, blast-furnaces, steel-works, rolling-mills and engine-works, fitted on the most elaborate scale. The firm produced warships as well as merchant vessels, and their system of rolling armour plates, introduced in 1856, was generally adopted by other builders. In 1865 he turned the business into Palmer's Shipbuilding and Iron Company, Limited. In 1886 his services in connection with the settlement of the costly dispute between British shipowners and the Suez Canal company (of which he was then a director) were rewarded with a baronetcy. He died in London on June 4, 1907.

PALMER, EDWARD HENRY (1840–1882), English Orientalist, the son of a private schoolmaster, was born at Cambridge, on Aug. 7, 1840. He was educated at the Perse school, and, after a short period as a clerk in London, he returned to Cambridge. He entered St. John's college in 1863, and in 1867 was elected a fellow on account of his attainments as an orientalist, especially in Persian and Hindustani. During his residence at St. John's he catalogued the Persian, Arabic and Turkish manuscripts in the university library, and in the libraries of King's and Trinity. In 1867 he published a treatise on *Oriental Mysticism*, based on the *Maksad-i-Aksā* of Aziz ibn Mohammed Nafasī. He was engaged in 1869 to join the survey of Sinai, undertaken by the Palestine Exploration Fund, and followed up this work in the next year by exploring the desert of El-Tīh in company with Charles Drake (1846–74). They completed this journey on foot and without escort, making friends among the Bedouin, to whom Palmer was known as "Abdallah Effendi." After a visit to the Lebanon and to Damascus, where he made the acquaintance of Sir Richard Burton, then consul there, he returned to England in 1870 by way of Constantinople and Vienna. At Vienna he met Arminius Vambéry. In the close of the year 1871 he became Lord Almoner's professor of Arabic at Cambridge.

In 1881 Palmer left Cambridge, and joined the staff of the *Standard* newspaper to write on non-political subjects. He was called to the English bar in 1874, and early in 1882 he was asked by the Government to assist the Egyptian expedition by his influence over the Arabs of the desert El-Tīh. He was instructed, apparently, to prevent the Arab sheikhs from joining the Egyptian rebels and to secure their non-interference with the Suez Canal. He went to Gaza, without an escort made his way safely through the desert to Suez—an exploit of singular boldness—and was highly successful in his negotiations with the Bedouin. He was appointed interpreter-in-chief to the force in Egypt, and from Suez he was again sent into the desert with Captain William John Gill and Flag-Lieutenant Harold Charrington to procure camels and gain the allegiance of the sheikhs by considerable presents of money. On this journey he and his companions were led into an ambush and murdered (Aug. 1882). Their remains, recovered after the war by the efforts of Sir Charles (then Colonel) Warren, now lie in St. Paul's Cathedral.

Palmer's highest qualities appeared in his travels, especially in the heroic adventures of his last journeys. His brilliant scholarship is displayed rather in the works he wrote in Persian and other Eastern languages than in his English books, which were generally written under pressure. His scholarship was wholly Eastern in character, and lacked the critical qualities of the modern school of Oriental learning in Europe. All his works show a great linguistic range and very versatile talent; but he left no permanent literary monument worthy of his powers.

His chief writings are *The Desert of the Exodus* (1871), *Poems of Behā ed Din* (Ar. and Eng., 1876–1877), *Arabic Grammar* (1874), *History of Jerusalem* (1871), by Besant and Palmer—the latter wrote the part taken from Arabic sources; *Persian Dictionary* (1876) and *English and Persian Dictionary* (posthumous, 1883); translation of the Ḳoran (1880) for the *Sacred Books of the East* series, a spirited but not very accurate rendering. He also did good service in editing the *Name Lists* of the Palestine Exploration.

PALMER, JOHN MCAULEY (1817–1900), American soldier and political leader, was born at Eagle Creek, Ky., on Sept. 13, 1817. In 1831 his family removed to Illinois, and in 1839 he was admitted to the bar in that State. In 1852–55 he was a Democratic member of the State senate, but joined the Republican Party upon its organization and became one of its leaders in Illinois. He was a delegate to the Republican national convention in 1856 and a Republican presidential elector in 1860. During the Civil War he served in the Union army, rising from the rank of colonel to that of major-general in the volunteer service and taking part in the battles of Stone River and Chickamauga, and, under Thomas, in the Atlanta campaign. He was governor of Illinois from 1869 to 1873. In 1872 he joined the Liberal-Republicans, and eventually returned to the Democratic Party. In 1891–97 he was a Democratic member of the United States Senate. In 1896 he was nominated for the presidency, by the "Gold-Democrats," but received no electoral votes. He died at Springfield, Ill., on Sept. 25, 1900.

See *The Personal Recollections of John M. Palmer—The Story of an Earnest Life,* published posthumously in 1901.

PALMER, SAMUEL (1805–1881), English landscape painter and etcher, was born in London on Jan. 27, 1805. In 1819 he exhibited both at the Royal Academy and the British Institution; and shortly afterwards he became intimate with John Linnell, who introduced him to Varley, Mulready, and, above all, to William Blake, whose strange and mystic genius had the most powerful effect on Palmer's art. He died at Reigate on May 24, 1881.

His English metrical version of Virgil's *Eclogues,* which was published posthumously in 1883, contains reproductions of his watercolours, and etchings completed by his son A. H. Palmer. Other representative plates are "The Early Ploughman," in *Etching and Etchers* 1st ed., and "The Herdsman's Cottage" in the 3rd edition.

PALMER, a town of Hampden county, Massachusetts, U.S.A., on the Chicopee river, 15 m. E. of Springfield. It is served by the Boston and Albany, the Boston and Maine, and the Central Vermont railways. Pop. (1920), 9,896 (28% foreign-born white); 11,044 in 1925 (State census). It occupies 31 m. of hilly country, and embraces four villages. The more important manufactures are cotton and wire goods, metal culverts, brushes and carpets. Palmer was settled in 1716, and received a considerable accession of Scotch-Irish in 1718. In 1752 the plantation (called The Elbows) was established as the district of Palmer, and in 1775 the district became a town. It was a centre of Shays' Rebellion.

PALMER, a pilgrim who as a sign or token that he had made pilgrimage to Palestine carried a palm-branch attached to his staff, or more frequently a cross made of two strips of palm-leaf fastened to his hat (*see* PILGRIMAGE). The name "palmer" or "palmer-worm" is often given to many kinds of hairy caterpillars, specifically to that of the destructive tineid moth, *Ypsilophus ligulellus,* which chiefly attacks the apple; also to the grubs of various beetles. Artificial flies used in angling, covered with bristling hairs, are known also as "palmers" or "hackles."

PALMERSTON, HENRY JOHN TEMPLE, 3RD VISCOUNT (1784–1865), English statesman, was born at Broadlands, near Romsey, Hants, on Oct. 20, 1784, the son of Henry, 2nd Viscount Palmerston and his wife Mary Mee. Much of Palmerston's early childhood was spent in Italy, but he was sent to Harrow School at eleven. He had just left school when, in 1802, he succeeded his father in the peerage, an Irish one, which did not prevent membership of the House of Commons. From Harrow he went to Edinburgh, where he attended the lectures of Dugald Stewart, with whom he boarded. He entered St. John's College, Cambridge, in 1803; in 1806 he began his political career.

Before he was four-and-twenty he had stood two contested elections for the University of Cambridge, at which he was defeated, and he entered parliament for a pocket-borough, Newtown, Isle of Wight, in June 1807. Influence secured for him a junior lordship of the admiralty in the Portland administration of 1807. He delivered his maiden speech in the House of Commons in defence of the expedition against Copenhagen. When Perceval formed his government in 1809, he proposed to this young man of five-and-twenty to take the chancellorship of the exchequer. Palmerston, however, preferred the less important office of secretary-at-war, charged exclusively with the financial business of the army, without a seat in the cabinet, and in this position he remained, without any signs of an ambitious temperament or of great political abilities, for twenty years (1809–1828) under five prime ministers, steadily refusing preferment. During the whole of that period Palmerston was chiefly known as a man of fashion, and a subordinate minister without influence on the general policy of the cabinets he served. Some of the most humorous poetical pieces of the *New Whig Guide* were from his pen, and he was entirely devoted, like his friends Peel and Croker, to the Tory party of that day. Palmerston never was a Whig, still less a Radical; he was a statesman of the old English aristocratic type, liberal in his sentiments, favourable to the march of progress, but entirely opposed to the claims of democratic government. He had been elected M.P. for Cambridge University in 1811, and sat for this constituency until 1831 when he was defeated because he had adopted reform principles.

In the later years of Lord Liverpool's administration, after the death of Lord Londonderry in 1822, strong dissensions existed in the cabinet. Palmerston supported the measures of Canning and his friends. The "Canningites," as they were termed—Palmerston, Huskisson, Charles Grant, Lamb (Lord Melbourne) and Dudley—were included by Wellington in his cabinet of 1827, but a dispute between the duke and Huskisson soon led to the resignation of that minister, and his friends resigned with him. In the spring of 1828 Palmerston found himself in opposition. From that moment he appears to have directed his attention closely to foreign affairs; indeed he had already urged on the duke of Wellington a more active interference in the affairs of Greece; he had made several visits to Paris, where he foresaw the impending revolution; and on June 1, 1829, he made his first great speech on foreign affairs. Palmerston was no orator; his language was unstudied, and his delivery somewhat embarrassed; but he addressed the House of Commons in language adapted to the capacity and the temper of his audience. Wellington sought, in September 1830, to induce Palmerston to re-enter the cabinet, which he refused because he was now committed to parliamentary reform, and from that time forward he may be said to have associated his political fortunes with those of the Whig party. Lord Grey placed the department of foreign affairs in his hands upon the formation of the ministry of 1830, and Palmerston entered on the duties of an office over which he continued to exert his powerful influence, both in and out of office, for twenty years.

Foreign Minister.—The revolution of July 1830 had just given a strong shock to the existing settlement of Europe. The British foreign office was especially concerned with the fate of Belgium, in revolution against the king of the Netherlands and coveted by France. In the end the policy of England prevailed; numerous difficulties, both great and small, were overcome by the conference, although on the verge of war, peace was maintained; and Prince Leopold of Saxe-Coburg was placed upon the throne of Belgium. The independence of Belgium was a solid success for Palmerston's diplomacy.

In 1833 and 1834 the youthful queens Donna Maria of Portugal and Isabella of Spain were the representatives and the hope of the constitutional party in those countries—assailed and hard pressed by their absolutist kinsmen Don Miguel and Don Carlos. Palmerston conceived and executed the plan of a quadruple alliance of the constitutional states of the West to serve as a counterpoise to the northern alliance. A treaty for the pacification of the Peninsula was signed in London on April 22, 1834; and, although the struggle was somewhat prolonged in Spain, it accomplished its object. But Louis Philippe was accused of secretly favouring the Carlists, and he positively refused to be a party to direct interference in Spain. The hesitation of the French court on this question was probably one of the causes of the extreme personal hostility Palmerston showed towards the king of the French down to the end of his life. Nevertheless, at this same time (June 1834) Palmerston wrote that "Paris is the pivot of my foreign policy." Thiers was at that time in office. Unfortunately differences with France increased in each succeeding year; and a constant but sterile rivalry was kept up, which ended in results humiliating and injurious to both nations.

In Near Eastern politics Palmerston had been from the beginning a strenuous supporter of the claims of the Hellenes against the Turks and the execution of the Treaty of London. But from 1830 the defence of the Ottoman Empire became one of the cardinal objects of his policy. He believed in the regeneration of Turkey. His two principal aims were to prevent the establishment of Russia on the Bosporus and of France on the Nile, and he regarded the maintenance of the authority of the Porte as the chief barrier against both these aggressions. Towards Russia he was suspicious and hostile. He was a party to the publication of the "Portfolio" in 1834, and to the mission of the "Vixen" to force the blockade of Circassia about the same time. He regarded the treaty of Unkiar Skelessi which Russia extorted from the Porte in 1832, when she came to the relief of the sultan after the battle of Konieh, with great jealousy; and, when the power of Mehemet Ali in Egypt appeared to threaten the existence of the Ottoman dynasty, he effected a combination of all the powers, who signed the collective note of July 27, 1839, pledging them to maintain the independence and integrity of the Turkish Empire. On three former occasions, in 1833, 1835 and 1839, the Turkish policy of Palmerston had been overruled by the cabinet. But in 1840 Lord Palmerston prevailed. France, though her ambassador had signed the collective note in the previous year, declined to be a party to measures of coercion against Mehemet Ali. Palmerston, irritated at her Egyptian policy, flung himself into the arms of the northern powers, and the treaty of July 15, 1840 between England, Russia, Austria and Prussia, engaging to assist the sultan against Mehemet Ali, was signed in London without the knowledge or concurrence of France. This measure was not taken without strong opposition on the part of several members of the British cabinet. By now Palmerston was regarded as one of the most powerful statesmen of the age. At the same time, though acting with Russia in the Levant, the British government engaged in the affairs of Afghanistan to defeat her intrigues in Central Asia, and a contest with China was terminated by the conquest of Chusan, afterwards exchanged for the island of Hong-Kong.

After the fall (1841) of the Melbourne administration Palmerston remained for five years out of office. The crisis was past, but the change which took place by the substitution of Guizot for Thiers in France, and of Aberdeen for Palmerston in England, was a fortunate event for the peace of the world. Palmerston distrusted France and believed that war between the two countries was sooner or later inevitable. Aberdeen and Guizot, by mutual confidence and friendly offices, entirely succeeded in restoring cordial understanding between the two governments, and the irritation which Palmerston had inflamed gradually subsided. During the Peel administration Palmerston led a retired life, but he attacked with characteristic bitterness the Ashburton treaty with the United States, which closed successfully other questions he had long kept open. Palmerston approached questions of foreign policy with an amount of passion, of personal animosity, and imperious language which rendered him in the eyes of the queen and of his colleagues a dangerous minister. Lord John Russell's failure to form a ministry (Dec. 1845) was due to Grey's refusal to join a government in which Palmerston had the direction of foreign affairs. A few months later this difficulty was surmounted; the Whigs returned to power, and Palmerston to the foreign office (July 1846), with a strong assurance that Lord John Russell should exercise a strict control over his proceedings. A few days sufficed to show how vain was this expectation. The French government regarded Palmerston's appointment as a sign of renewed hostility, and a despatch in which Palmerston had put forward the name of a Coburg prince as husband for the young queen of Spain, served as an excuse for a breach of the engagements entered into between Guizot and Aberdeen. The efforts of the British minister to defeat the French marriages of the Spanish princesses, by an appeal to the treaty of Utrecht and the other powers of Europe, were wholly unsuccessful; France won the game, though with no small loss of honourable reputation.

The revolution of 1848 spread like a conflagration through Europe, and shook every throne on the Continent except those of Russia, Spain and Belgium. Palmerston's sympathies had been passionately awakened by the cause of Italian independence. He supported the Sicilians against the king of Naples, and the king of Sardinia against Austria. The British government, or at least Palmerston as its representative, was regarded with suspicion and resentment by every power in Europe, except the French republic; and even that was shortly afterwards to be alienated by Palmerston's attack on Greece.

This state of things was regarded with the utmost annoyance by the British court and by most of the British ministers. Palmerston had on many occasions taken important steps without their knowledge, which they disapproved. Over the foreign office he asserted and exercised an arbitrary dominion, which the feeble efforts of the premier could not control. The queen and the prince consort (*see* VICTORIA, QUEEN) did not conceal their indignation at the position in which he had placed them with all the other courts of Europe. When Kossuth, the Hungarian leader, landed in England, Palmerston proposed to receive him at Broadlands, a design which was only prevented by a peremptory vote of the cabinet; and in 1850 he took advantage of Don Pacifico's very questionable claims on the Hellenic government to organize an attack on the little kingdom of Greece. Greece being a state under the joint protection of three powers, Russia and France protested against its coercion by the British fleet, and the French ambassador temporarily left London, which promptly led to the termination of the affair. But it was taken up in parliament with great warmth. After a memorable debate (June 17), Palmerston's policy was condemned by a vote of the House of Lords. The House of Commons was moved by Roebuck to reverse the sentence, which it did (June 29) by a majority of 46, after having heard from Palmerston the most eloquent and powerful speech ever delivered by him, in which he sought to vindicate, not only his claims on the Greek government for Don Pacifico, but his entire administration of foreign affairs. It was in this speech, which lasted five hours, that Palmerston made the well-known declaration that a British subject—"Civis Romanus sum"—ought everywhere to be protected by the strong arm of the British government against injustice and wrong. Yet, notwithstanding this parliamentary triumph, there were not a few of his own colleagues and supporters who condemned the spirit in which the foreign relations of the Crown were carried on; and in that same year the queen addressed a minute to the prime minister in which she recorded her dissatisfaction at the manner in which Lord Palmerston evaded the obligation to submit his measures for the royal sanction as failing in sincerity to the Crown. This minute was communicated to Palmerston, who did not resign upon it. This distrust and uneasiness reached their climax when Palmerston expressed to the French ambassador in London, without the concurrence of his colleagues, his personal approval of the coup d'état of Louis Napoleon. Upon this Lord John Russell advised his dismissal from office (Dec. 1851). Palmerston avenged himself by turning out the government on a militia bill; but

although he survived for many years, and twice filled the highest office in the state, his career as foreign minister ended for ever, and he returned to the foreign office no more. Indeed, he assured Lord Aberdeen, in 1853, that he did not wish to resume the seals of that department.

Upon the formation of the cabinet of 1853, which was composed by the junction of the surviving Peelites with the Whigs, under Aberdeen, Palmerston accepted with the best possible grace the office of secretary of state for the home office. At one moment he withdrew from it, because Lord John Russell persisted in presenting a project of reform which appeared to him entirely out of season; and he advocated, with reason, measures of greater energy on the approach of war, which might possibly, if they had been adopted, have averted the contest with Russia. As the difficulties of the Crimean campaign increased, it was not Lord Palmerston but Lord John Russell who broke up the government by refusing to meet Roebuck's motion of inquiry. Palmerston remained faithful and loyal to his colleagues in the hour of danger. Upon the resignation of Lord Aberdeen and the duke of Newcastle, the general sentiment of the House of Commons and the country called Palmerston to the head of affairs, and he entered, on Feb. 5, 1855, aged 70, upon the high office, which he retained, with one short interval, to the day of his death.

Prime Minister.—A series of fortunate events followed his accession to power. In March 1855 the death of the emperor Nicholas removed his chief antagonist. In September Sevastopol was taken. The administration of the British army was reformed by a consolidation of offices. In the following spring peace was signed in Paris. Never since Pitt had a minister enjoyed a greater share of popularity and power, and, unlike Pitt, Palmerston had the prestige of victory in war. He was assailed in parliament by the eloquence of Gladstone, the sarcasms of Disraeli, and the animosity of the Manchester Radicals, but the country was with him. Defeated by a hostile combination of parties in the House of Commons on the question of the Chinese war in 1857 and the alleged insult to the British flag in the seizure of the lorcha "Arrow," he dissolved parliament and appealed to the nation. The result was the utter defeat of the extreme Radical party and the return of a more compact Liberal majority. The great events of the succeeding years, the Indian Mutiny, and the invasion of Italy by Napoleon III., belong rather to the general history of the times than to the life of Palmerston; but it was fortunate that a strong and able government was at the head of affairs. Lord Derby's second administration of 1858 lasted but a single year, Palmerston having casually been defeated on a measure for removing conspiracies to murder abroad from the class of misdemeanour to that of felony, which was introduced in consequence of Orsini's attempt on the life of the emperor of the French. But in June 1859 Palmerston returned to power, and it was on this occasion that he proposed to Cobden, one of his most constant opponents, to take office; on his refusal Milner Gibson was appointed to the board of trade, although he had been the prime mover of the defeat of the government on the Conspiracy Bill. Palmerston had learnt that it was wiser to conciliate an opponent than to attempt to crush him. Although Palmerston approved the objects of the French invasion of Italy in so far as they went to establish Italian independence, the annexation of Savoy and Nice to France revived his old suspicions of the good faith of Napoleon III. He believed that war with France was a contingency to be provided against and he induced the House of Commons to vote nine millions for the fortification of British ports and arsenals.

Palmerston resisted the Suez canal project of Lesseps. He did not foresee the advantages to be derived by British commerce from this great work, and he was strongly opposed to the establishment of a powerful French company on the soil of Egypt. He also believed that England would be drawn by her interest, as a great commercial power, in the canal traffic, into a more direct interference in Egypt, which it was desirable to avoid.

Upon the outbreak of the American Civil War in 1861, Palmerston acknowledged that it was the duty of the British government to remain neutral; but his own opinion led him rather to desire than to avert the rupture of the Union, which might have been the result of a refusal on the part of England and France to recognize a blockade of the Southern ports, which was notoriously imperfect, and extremely prejudicial to the interests of Europe. The cabinet was not of this opinion, and, although the belligerent rights of the South were promptly recognized, the neutrality of the Government was observed. When, however, the Southern envoys were taken by force from the "Trent," a British packet, Palmerston insisted upon a full and complete reparation. But the difficulty with the American government over the "Alabama" and other vessels, fitted out in British ports to help the Southern cause, was only settled at last (*see* ALABAMA ARBITRATION) by an award extremely onerous to England.

The last transaction in which Palmerston engaged arose out of the attack by the Germanic Confederation, and its leading States Austria and Prussia, on the kingdom of Denmark and the duchies of Schleswig and Holstein. There was but one feeling in the British public and the nation as to the dishonest character of that unprovoked aggression, and it was foreseen that Austria would ere long have reason to repent her share in it. Palmerston endeavoured to induce France and Russia to concur with England in maintaining the Treaty of London, which had guaranteed the integrity of the Danish dominions. But those powers, for reasons of their own, stood aloof, and the conference held in London in 1864 was without effect. A proposal to send the British fleet into the Baltic was overruled and the result was that Denmark was left to her own resources against her formidable opponents. In the following year, on Oct. 18, 1865, Palmerston expired at Brocket Hall, after a short illness, in the eighty-first year of his age. His remains were laid in Westminster Abbey.

Character.—Although there was much in the official life of Palmerston which inspired distrust and alarm to men of a less ardent and contentious temperament, he had a lofty conception of the strength and the duties of England, he was the irreconcilable enemy of slavery, injustice and oppression; and he laboured with inexhaustible energy for the dignity and security of the Empire. In private life his gaiety, his buoyancy, his high breeding, made even his political opponents forget their differences; and even the warmest altercations on public affairs were merged in his large hospitality and cordial social relations. In this respect he was aided with consummate ability by the tact and grace of Lady Palmerston, the widow of the 5th Earl Cowper, whom he married at the close of 1839, and who died in 1869.

The *Life of Lord Palmerston*, by Lord Dalling (2 vols., 1870), with valuable selections from the minister's autobiographical diaries and private correspondence, only came down to 1847, and was completed by Evelyn Ashley (vol. iii., 1874; iv, v., 1876). The whole was re-edited by Mr. Ashley, in two volumes (1879), the standard biography. The *Life* by Lloyd Sanders (1888) is an excellent shorter work. *See* also B. K. Martin, *The Triumph of Lord Palmerston. A study of public opinion in England before the Crimean war* (1926).

PALMERSTON: *see* NORTHERN AUSTRALIA; PORT DARWIN.

PALMERSTON NORTH, a town in the Manawatu district of New Zealand, 87 miles north of Wellington. Pop. (1927) 20,540. It is the centre of a thriving dairy and sheep-raising district, an important railway junction, and the first borough of New Zealand to institute rating on "unimproved" capital values.

PALMERTON, a borough of Carbon county, Pennsylvania, U.S.A., on the Lehigh river, 15 m. N.W. of Allentown. It is served by the Central of New Jersey, the Chestnut Ridge, and (for freight) the Lehigh and the New England railways. Pop. (1920) 7,168 (33% foreign-born white); 1928 local estimate 9,000. It is the trade centre of a farming region, and manufactures zinc, silk and paints. The borough was incorporated in 1912.

PALMETTE, any decorative form consisting of radiating petals or scales, symmetrically disposed, and growing from a single focus at the bottom. The word is especially used of certain lotus (*q.v.*) derivatives in Egyptian and Asiatic art, and for somewhat similar forms occurring in the Byzantine and Romanesque styles. The classic palmette is usually termed an anthemion (*q.v.*).

PALMETTO, in botany, a popular name for *Sabal Palmetto,* the palmetto palm, a native of the southern United States,

especially in Florida. It has an erect stem, 20 to 80 ft. high and deeply cut fan-shaped leaves, 5 to 8 ft. long; the fruit is a black drupe ⅓ to ½ in. long. The trunks make good piles for wharves, as the wood resists the attacks of borers; the leaves are used for thatching. The palm is grown as a pot-plant in greenhouses. A similar species, the Texas palmetto (*S. texana*) occurs in southern Texas and Mexico. The terminal bud or cabbage is eaten. There is also a third species or dwarf palmetto (Sabal adansonii). The *chamaerops humilis* of South Europe is also called palmetto.

PALMGREN, SELIM (1878–), Finnish composer, was born at Björneborg, Finland, on Feb. 16, 1878. In 1895 he went to Helsingfors conservatoire, where he studied composition under Wegelius and piano under Petzet. He afterwards worked with Ansorge and Busoni, and on his return to Finland became conductor of the Finnish Students choral society and later of the Musical Society at Abo. Since 1912 he has held no fixed appointment but has devoted himself to composition and undertaken concert tours with his wife Maikki Järnefelt, a singer. Palmgren has written two operas, *Daniel Hjort* (produced at Helsingfors 1910) and *Peter Schlemihl,* three piano concertos, and some pieces for violin and piano; but it is in his smaller piano works that his delicate and poetical writing finds the most appropriate medium. Among the best known of these are the *Finnish Lyrics, Finnish Lullaby,* the Studies, *Preludium, The Sea, The Swan, Light and Shade* and *Bird Song.*

PALMIET (*Prionium Palmita*), a shrubby, aloe-like, South African plant of the rush family (Juncaceae), reaching a height of six or seven feet, growing on the edges of streams. The stem is covered with the fibrous remains of old leaves. The plant propagates vegetatively by runners.

PALMISTRY, a predictive system whereby the various irregularities and flexion-folds of the skin of the hand are interpreted as being associated with mental or moral dispositions and powers as well as with the current of future events in the life of the individual. It is also called chiromancy or cheiromancy from χείρ, the hand, and μαντεία, divination.

How far back in prehistoric times this system has been practised it is impossible to say, but in China it is said to have existed 3,000 years before Christ, and in Greek literature it is treated even in the most ancient writings as well-known belief.

At the present day palmistry is practised in nearly all parts of China. It is also extensively practised in India, especially by one caste of Brahmins, the Joshi. In Syria and Egypt the palmist can be seen plying his trade at the cafés; and among the Arabs there are chiromantists who are consulted as to the probable success of enterprises. It is probably from their original Indian home that the traditional *dukkeripen* (fortune-telling) of the gipsies has been derived.

This system of divination has the charm of simplicity and definiteness, as an application of the "doctrine of signatures" which formed so extensive an element in the occult writings of the past six centuries. In the course of ages every detail has been brought under a formal set of rules, which only need mechanical application. There have been in past times considerable divergences in the practice, but at present there is a fairly uniform system in vogue. One school lays special stress on the general shape and outline of the hand. Corvaeus enumerates 70 varieties, Pamphilus cuts them down to 6, John de Indagine to 27, and Tricassus Mantuanus raises them to 80. The characters of softness or hardness, dryness or moisture, etc., are taken account of in these classifications. The lines of cardinal importance are (1) the rasceta or cross sulci, which isolate the hand from the forearm at the wrist, and which are the flexion folds between the looser forearm skin and that tied down to the fascia above the level of the anterior annular ligament. (2) The line which isolates the ball of the thumb, where the skin ceases to be tied to the front of the palmar fascia, is called the line of life. (3) A line starting above the head of the second metacarpal bone and crossing the hand to the middle of its ulnar border is the line of the head. (4) The transverse line below this which passes from the ulnar border a little above the level of the head of the fifth metacarpal and ends somewhere about the root of the index finger is the line of the heart. (5) The vertical line descending from the middle of the wrist to end about the base of the middle finger is the line of fortune. (6) The oblique line which begins at the wrist end of the line of life and descends towards the ulnar end of the line of the head is the line of the liver.

These lines isolate certain swellings or monticuli, the largest of which is (1) the ball of the thumb, called the mountain of Venus; (2) that at the base of the index finger is the mountain of Jupiter; (3) at the root of the middle finger is the mountain of Saturn, while those at the bases of ring and little finger are respectively the mountains of the (4) Sun and (5) of Mercury. Above the mountain of Mercury, and between the lines of head and heart is (6) the mountain of Mars, and above the line of the heart is (7) the mountain of the Moon. The relative sizes of these mountains have assigned to them their definite correlations with characters: the 1st with charity, love, libertinage; the 2nd with religiosity, ambition, love of honour, pride, superstition; the 3rd with wisdom, good fortune, prudence, or when deficient improvidence, ignorance, failure; the 4th when large makes for success, celebrity, intelligence, audacity, when small meanness or love of obscurity; the 5th indicates love of knowledge, industry, aptitude for commerce, and in its extreme forms on the one hand love of gain and dishonesty, on the other slackness and laziness. The 6th is related to degrees of courage, resolution, rashness or timidity; the 7th indicates sensitiveness, morality, good conduct, or immorality, overbearing temper and self-will.

The swellings on the palmar faces of the phalanges of the several fingers are also indicative, the 1st and 2nd of the thumb respectively, of the logical faculty and of the will; the 1st, 2nd and 3rd of the index finger, of materialism, law and order, idealism; those of the middle finger, humanity, system, intelligence; of the ring finger, truth, economy, energy; and of the little finger, goodness, prudence, reflectiveness.

Over and above these there are other marks, crosses, triangles, etc., of which more than a hundred have been described and figured by different authors, each with its interpretation; and in addition the back of the hand has its ridges. The Chinese combine podoscopy with chiromancy.

To the anatomist the roughnesses of the palm are of considerable interest. The folds are so disposed that the thick skin shall be capable of bending in grasping, while at the same time it requires to be tightly bound down to the skeleton of the hand, else the slipping of the skin would lead to insecurity of prehension, as the quilting or buttoning down of the covers of furniture by upholsterers keeps them from slipping. For this purpose the skin is tied by connecting fibres of white fibrillar tissue to the deep layer of the dermis along the lateral and lower edges of the palmar fascia and to the sheaths of the flexor tendons. The folds, therefore, which are disposed for the purpose of making the grasp secure, vary with the relative lengths of the metacarpal bones, with the mutual relations of the sheaths of the tendons, and the edge of the palmar fascia, somewhat also with the insertion of the palmaris brevis muscle. The sulci are emphasized because the subcutaneous fat, which is copious in order to pad the skin for the purpose of firmness of holding, being restricted to the intervals between the lines along which the skin is tied down, makes these intervals project, and these are the monticuli. The swelling of the mountain of Venus is simply the indication of the size of the muscles of the ball of the thumb, and can be increased by their exercise. Similarly the hypothenar muscles for the little finger underlie the three ulnar marginal mountains, the sizes of which depend on their development and on the prominence of the pisiform bone.

That these purely mechanical arrangements have any psychic, occult or predictive meaning is a fantastic imagination, which seems to have a peculiar attraction for certain types of mind, and as there can be no fundamental hypothesis of correlation, its discussion does not lie within the province of reason.

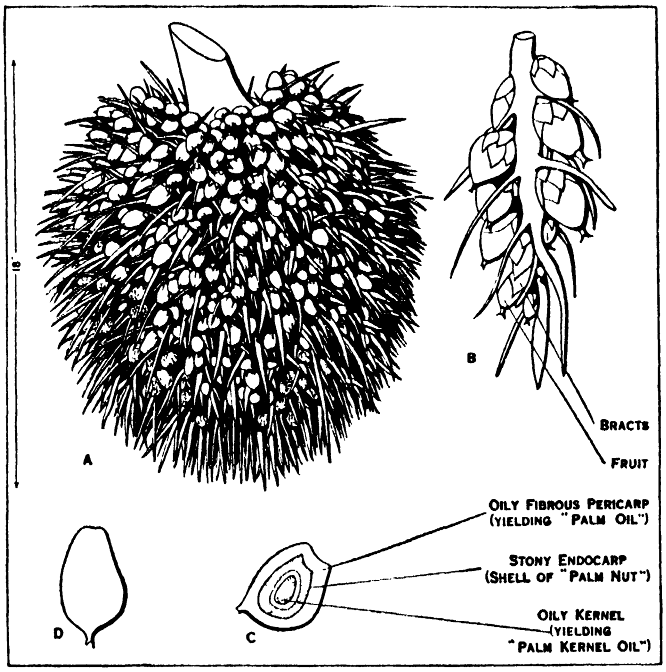
(A. Mac.)

PALMITIC ACID: *see* Fatty Acids.

PALM OIL. A fatty oil obtained from the fleshy part of the fruit of the oil-palm (*Elaeis guineensis* Jacq.), a tree in-

digenous to the west coast of Africa[1]. Palm oil must not be confounded with the oil from the kernel (*palm-kernel oil*), which differs widely from palm oil and resembles coconut oil in its constitution, properties and applications. (*See* Oil Palm.)

The ripe palm-fruit is gathered by natives and stored for three or four days; the fruits are then detached from the bunches and placed in a pit in the ground lined with leaves; water is sprinkled on the top, and the mass covered and allowed to ferment



DETAILS OF THE STRUCTURE OF THE OIL PALM (ELAEIS GUINEENSIS)
A. The fruit bunch (female inflorescence) composed of spikes (B), bearing fruits, the structure of which is shown at C. D. A single fruit (drupe), bracts removed, containing 1 to 3 kernels in the "palm nut." Each bunch bears about 2,000 to 3,000 fruits. Some 1,400 bunches of fruit are required for the production of one ton of oil

for one or two months. Under this treatment the fruit softens, so that the hard kernel can easily be separated. The softened flesh is beaten to a pulp, and roughly squeezed in bags; a further quantity of oil is obtained by boiling the pressed pulp with water. *Chop oil* is a special grade of oil prepared by the natives for food, by boiling the fresh fruits with water and skimming off the oil which rises to the surface. Owing to the fermentation occurring when the fruits are treated by the first method, the oil becomes hydrolysed, giving rise to large amounts of free fatty acids. Since the introduction of machinery, and with improved cultivation of the trees, better quality oils have been produced, and oils with as little as 2% of free fatty acids can be prepared in bulk.

Palm oil, which is liquid in the Tropics but a semi-solid fat in temperate climates, varies in colour from yellowish-red to dark brownish-red; before use it is bleached, either by blowing air through the heated oil or by treating the oil with sodium bichromate and hydrochloric acid. By these means an almost white fat is produced. Large quantities of palm oil are employed in the soap and candle industries; it is also used in tin-plate manufacture for protecting the heated steel plates before tinning, and for edible purposes. Attempts have been made to use palm oil as a fuel for the internal-combustion engines of motor boats on the Congo and other West African rivers. (*See* also Oils and Fats.)

Imports of Palm Oil, 1926

Into	Tons
United Kingdom	69,000
United States	58,000
France	23,000
Germany	14,000

See the *Bulletins* of the Imperial Institute. (E. L.; G. H. W.)

[1]Recently plantation cultivation of the oil-palm under scientific control has been introduced into the West Indies with encouraging results.

PALMSTIERNA, ERIK KULE, Baron (1877–), Swedish statesman, was born on Nov. 10, 1877. He entered the navy as sub-lieutenant, but gave up his naval career for administrative work, and became secretary of the central association for social work in 1906. From 1907 to 1915 he was organizer of the Svenska Stadsforbundt. Elected by the Liberals and Social Democrats to the *Riksdag,* he was minister of marine in the Coalition Government of 1917, and minister of foreign affairs in the Branting Government. In 1920 Palmstierna was appointed minister at the court of St. James; the following year he represented Sweden at Geneva in the Aaland islands question.

PALM SUNDAY, the Sunday before Easter, so called from the custom, still observed in the Roman Catholic Church, of blessing palm branches and carrying them in procession in commemoration of Christ's triumphal entry into Jerusalem. In the Western Church, Palm Sunday is counted as the first day of Holy Week, and its ceremonies usher in the series of services, culminating in those of Good Friday, which commemorate the Passion.

The ceremonies on Palm Sunday as celebrated now in the Roman Catholic Church are divided into: (1) The solemn blessing of the palms, (2) the procession, (3) the mass.

In the Orthodox Eastern Church Palm Sunday (*ἡ κυριακὴ ἑορτὴ τῶν βαΐων, ἑορτὴ βαϊοφόρος,* or *ἡ βαϊοφόρος*) is not included in Holy Week, but is regarded as a joyous festival commemorating Christ's triumphal entry into Jerusalem. There is no longer a procession; but the palms (in Russia willow twigs) are blessed, and are held by the worshippers during the service.

Of the reformed churches, the Church of England alone includes Palm Sunday in the Holy Week celebrations. The blessing of the palms and the procession were, however, abolished at the Reformation, and the name "Palm Sunday," though it survives popularly, is not mentioned in the Book of Common Prayer.

Brand, *Popular antiquities* (ed. 1870). *See* also *Catholic Encyclopaedia, s.v.* "Palm Sunday."

PALMYRA, the Greek and Latin name of a famous city of the East, now a mere collection of Arab hovels, but still an object of interest on account of its wonderful ruins. In II. Chron. viii. 4, and in the native inscriptions, it is called Tadmor, and this is the name by which it is known among the Arabs at the present day and, it would seem, as far back as the 12th century B.C., for "Tâdmar which is in the land of the Amurru" occurs in an inscription of Tiglath-Pileser I. *c.* 1115–1100 B.C. (Dhorme in *Rev. Bibl.* 1924, pp. 106 ff.). The site lies 150m. N.E. of Damascus and five days' camel journey from the Euphrates, in an oasis of the Syrian desert, 1,300ft. above sea-level. At this point the great trade routes met in ancient times, the one crossing from the Phoenician ports to the Persian gulf, the other coming up from Petra and south Arabia.

In II. Chron. viii. 4, Solomon is said to have built "Tadmor in the wilderness"; I. Kings ix. 18, however, from which the Chronicler derived his statement, reads "Tamar" in the Hebrew text, with "Tadmor" in the Hebrew margin; there can be no doubt that the text is right and refers to Tamar in the land of Judah (Ezek. xlvii. 19; xlviii. 28). The Chronicler, we must suppose, altered the name because Tadmor was a city more renowned in his day, or possibly because he wished to increase the extent of Solomon's kingdom. The date of the Chronicler may be placed about 300 B.C., so Palmyra must have been in existence centuries before then. Of its remoter history, except for the allusion in Tiglath-Pileser's inscription, nothing is known. We may suppose that after the fall of the Babylonian Empire (6th century B.C.), Arabian tribes began to take possession of the partly cultivated lands east of Canaan, and learned to speak and write in Aramaic, the language which was most widely current throughout the region west of the Euphrates in the time of the Persian Empire (6th–4th century B.C.). It is not till much later that Palmyra

first appears in Western literature. We learn from Appian (*Bell. civ.* v. 9) that in 42–41 B.C. the city was rich enough to excite the cupidity of Mark Antony. The series of native inscriptions, written in Aramaic, begins a few years after; the earliest bears the date 304 of the Seleucid era, *i.e.*, 9 B.C. (Cooke, *North-Semitic Inscriptions* No. 141 = Vogüé, *Syrie Centrale* No. 30*a*); by this time Palmyra had become an important trade-post between the Roman and the Parthian states. Its characteristic civilization grew out of a mixture of various elements, Arabic, Aramaic, Greek and Roman. The bulk of the population was of Arab race, and though Aramaic was used as the written language, in common intercourse Arabic had by no means disappeared. The proper names and the names of deities, while partly Aramaic, are also in part unmistakably Arabic: it is suggestive that a purely Arabic term (*faḥd, NSI.* No. 136) was used for the septs into which the citizens were divided.

Originally an Arab settlement, the oasis was transformed in the course of time from a mere halting-place for caravans to a city of the first rank, and a religious centre, with the worship of the Sun-god dominating that of inferior deities.

The chief luxuries of the ancient world, silks, jewels, pearls, perfumes, incense and the like, were drawn from India, China and southern Arabia. The trade followed two routes; one by the Red sea, Egypt and Alexandria, the other from the Persian gulf through the Syro-Arabian desert. The latter, when the Nabataean kingdom of Petra (*q.v.*) came to an end (A.D. 105), passed into the hands of the Palmyrene merchants. Their caravans (συνοδίαι) travelled right across the desert to the great entrepôts on the Euphrates, (*NSI.* Nos. 113–115). The trade was enormously profitable, not only to the merchants but to the town, which levied a duty on all exports and imports; at the same time formidable risks had to be faced both from the desert-tribes and from the Parthians, and successfully to plan or convoy a great caravan came to be looked upon as a service to the state, often recognized by public monuments erected by "council and people" or by the merchants interested in the venture. These monuments, a conspicuous feature of Palmyrene architecture, took the form of statues placed on brackets projecting from the upper part of the pillars which lined the principal thoroughfares. Thus arose, beside minor streets, the imposing central avenue which, starting from a triumphal arch near the great temple of the Sun, formed the main axis of the city from south-east to north-west for a length of 1,240 yards, and at one time consisted of not less than 750 columns of rosy-white limestone, each 55ft. high.

Local industries do not seem to have been important. The prominent townsmen were engaged in the organization and even the personal conduct of caravans, the discharge of public offices such as those of *stratēgos*, secretary, guardian of the wells, president of the banquets of Bel, chief of the market (see *NSI.* Nos. 114, 115, 121, 122), sometimes the victualling of a Roman expedition. The capable performance of these functions, which often involved considerable pecuniary sacrifices, ensured public esteem; and to these honours the head of a great house was careful to add the glory of a splendid tomb, consecrated as the "long home" (lit. "house of eternity," *cf.* Eccles. xii. 5) of himself, his sons and his sons' sons for ever. These tombs, which lie outside the city and overlook it from the surrounding hills, a feature characteristically Arabic, remain the most interesting monuments of Palmyra. Some are lofty towers containing sepulchral chambers in stories; others are house-like buildings with a single chamber and a richly ornamented portico; the sides of these chambers within are adorned with the names and sculptured portraits of the dead. As a rule the buildings of Palmyra do not possess any architectural individuality, but these tombs are an exception. The style of all the ruins is late classic and highly ornate, but without refinement.

The rise of Palmyra to a position of political importance may be dated from the first imperial period, when the city must have admitted the suzerainty of Rome, for decrees respecting its custom-dues were issued by Germanicus (A.D. 17–19) and Cn. Domitius Corbulo (A.D. 57–66). At the same time the city had by no means surrendered its independence; even in the days of Vespasian (A.D. 69–79) the distinctive position of Palmyra as an intermediate state between the two great powers of Rome and Parthia was carefully watched. The splendid period of Palmyra (A.D. 130–270), to which the greater part of the inscribed monuments belong, started from the overthrow of Petra (A.D. 105), which left Palmyra without a competitor for the Eastern trade. Hadrian treated the city with special favour, and on the occasion of his visit in A.D. 130, granted it the name of Hadriana Palmyra (הדריגא תדמר *NSI.* p. 322). Under the same emperor the customs were revised and a new tariff promulgated (April, A.D. 137), cancelling the loose system of taxation "by custom" which formerly had prevailed. The great fiscal inscription, which still remains where it was set up, gives the fullest picture of the life and commerce of the city. (*NSI.* pp. 313–340). The government was vested in the council (βουλή) and people (δῆμος), and administered by civil officers with Greek titles, the *proedros* (president), the *grammateus* (secretary), the archons, syndics and *dekaprōtoi* (a fiscal council of ten), following the model of a Greek municipality under the Roman Empire. At a later date, probably under Septimius Severus or Caracalla (beginning of 3rd century), Palmyra received the *ius italicum* and the status of a colony; the executive officials of the council and people were called *stratēgoi*, equivalent to the Roman *duumviri* (*NSI.* Nos. 121, 127); and Palmyrenes who became Roman citizens began to take Roman names, usually Septimius or Iulius Aurelius, in addition to their native names.

It was the Parthian wars of the 3rd century which brought Palmyra to the front, and for a brief period raised her to an almost dazzling position as mistress of the Roman East. The inscriptions enable us to follow the rise of one house in particular, which prefixed to their Semitic names the Roman *gentilicium* of Septimius; its members, therefore, had received the citizenship under Septimius Severus (A.D. 193–211). In the next generation Septimius Odainath or Odaenathus, son of Hairan, had attained the rank of Roman senator (συγκλητικός, Vogüé No. 21, *NSI.* p. 285 *n.*) conferred no doubt when Alexander Severus visited Palmyra in A.D. 230–231; his son again, Septimius Hairan, seems to have been the first of the family to receive the title of Rās Tadmor ("chief of Tadmor") in addition to his Roman rank (*NSI.* No. 125); while his son, the famous Septimius Odainath, commonly known as Odaenathus (*q.v.*), the husband of Zenobia, received even higher rank, the consular dignity (ὑπατικός) which is given him in an inscription dated A.D. 258, in the reign of Valerian (*NSI.* No. 126). The East was then agitated by the advance of the Parthian Empire under the Sassanidae, and the Palmyrenes with their Roman honours and their Roman civilization, which did not really go much below the surface, had to choose one side or other. Their choice leaned towards Rome mainly because the Roman emperor was further off than the Persian king. In the contests which followed there can be no doubt that the Palmyrene princes cherished the idea of an independent empire of their own, though they never threw over their allegiance to the Roman suzerain until the closing act of the drama. Their opportunity came with the disaster which befell the Roman army under Valerian (*q.v.*) at Edessa. The Persians swept victoriously over Asia Minor and North Syria; not however without resistance on the part of Odaenathus, who inflicted considerable losses on the bands returning home from the pillage of Antioch. It was probably not long after this that Odaenathus, with a keen eye for his advantage, made overtures to the Persian king, Shapur I., and when they were rejected he threw himself into the Roman cause. After the death of Valerian, Gallienus succeeded to a merely nominal rule in the East, and made no effort to recover the lost provinces. Thereupon the two leading generals of the Roman army, Macrianus and Callistus, renounced their allegiance and proclaimed the two sons of the former as emperors (A.D. 261). During the crisis Odaenathus remained loyal to Gallienus, and was rewarded for his fidelity by the grant of a position without parallel under ordinary circumstances; as hereditary prince of Palmyra he was appointed *dux Orientis*, a sort of vice-emperor for the East (A.D. 262). He started promptly upon the work of recovery. With his Palmyrene

troops, strengthened by what was left of the Roman army corps, he took the offensive against Shapur, defeated him at Ctesiphon, and in a series of brilliant engagements won back the East for Rome. During his absence at the wars, we learn from the inscriptions (A.D. 262–267) that Palmyra was administered by his deputy Septimius Worod, "procurator ducenarius of Caesar our lord," also styled "commandant," as being Odaenathus' viceroy (ἀργαπέτης, *NSI*. Nos. 127–129). Then in the zenith of his success Odaenathus was assassinated at Ḥomṣ (Emesa) along with his eldest son Herodes (A.D. 266–267). The fortunes of Palmyra now passed into the vigorous hands of Zenobia (*q.v.*), who had been actively supporting her husband in his policy. Zenobia seems to have ruled on behalf of her young son Wahab-allath or Athenodōrus as the name is Graecized, who counts the years of his reign from the date of his father's death. Under Odaenathus Palmyra had extended her sway over Syria and Arabia but now the troops of Zenobia, numbering it is said 70,000, proceeded to occupy Egypt; the Romans under Probus resisted vigorously but without avail, and by the beginning of A.D. 270, when Aurelian succeeded Claudius as emperor, Wahab-allath was governing Egypt with the title of "king." His coins of 270 struck at Alexandria bear the legend *v*(*ir*) *c*(*onsularis*) *R*(*omanorum*) *im*(*perator*) *d*(*ux*) *R*(*omanorum*) and display his head beside that of Aurelian, but the latter alone is styled *Augustus*. Meanwhile the Palmyrenes were pushing their influence not only in Egypt but in Asia Minor while still professing to act under the terms of the joint rule conferred by Gallienus. Then in the course of the year A.D. 270–271 came the inevitable and open breach. In Palmyra Zenobia is still called "queen" (*βασίλισσα*, *NSI*. No. 131; *cf*. Wadd. 2628), but in distant quarters, such as Egypt, she and her son claim the dignity of Augustus; Wahab-allath (5th year) begins to issue coins at Alexandria without the head of Aurelian and bearing the imperial title; and Zenobia's coins bear the same. It was at this time (A.D. 271) that the two chief Palmyrene generals Zabdā and Zabbai, set up a statue to the deceased Odaenathus and gave him the sounding designation of "king of kings and restorer (or perhaps *corrector*) of the whole city" (*NSI*. No. 130). These assumptions marked a definite rejection of all allegiance to Rome. Aurelian, the true Augustus, quickly grasped the situation. At the close of A.D. 270 Probus brought back Egypt into the empire; then in 271 Aurelian made preparations for a great campaign against the seat of the mischief itself. He approached by way of Cappadocia, where he reduced the Palmyrene garrisons, and thence through Cilicia he entered Syria. At Antioch the Palmyrene forces under Zabdā attempted to resist him, but they were compelled to fall back, and at Emesa they were defeated in a stiffly contested battle. The way was now open to Palmyra and probably in the spring of A.D. 272 Aurelian captured the city. In accordance with the judicious policy which he had observed in Asia Minor and at Antioch, he granted full pardon to the citizens; only the chief officials and advisers were put to death; Zenobia and her son were captured and reserved for his triumph when he returned to Rome. But the final stage in the conquest of the city was yet to come. A few months later, in the autumn of 272—the latest inscription is dated August 272 (Vogüé, No. 116)—the Palmyrenes revolted, killed the Roman garrison quartered in the city, and proclaimed one Antiochus as their chief. Aurelian heard of it just when he had crossed the Hellespont on his way home. He returned instantly before any one expected him, and took the city by surprise. Palmyra was destroyed and the population put to the sword. Aurelian restored the walls and the great Temple of the Sun (A.D. 273); but the city never recovered its splendour or importance. The famous Palmyrene archers, however, served in the Roman army in Africa and elsewhere, even in Britain, as the inscription now at South Shields gives evidence (*NSI*. pp. 250, 312; Lidzbarski, *Ephemeris*, ii. 92).

Language.—The language spoken at Palmyra was a dialect of western Aramaic, and belongs to the same group as Nabataean and the Aramaic spoken in Egypt. In some important points, however, the dialect was related to the eastern Aramaic or Syriac (*e.g*. the plur. ending in *ē'*; the dropping of the final *ī* of the pronominal suffix third pers. sing. with nouns, and of the final *ū* of the third pers. pl. of the verb; the infin. ending *ū*, etc.). But the relation to western Aramaic is closer; specially characteristic are the following features: the imperf. beginning with *y*, not as in Syriac and the eastern dialects with *n* or *l*; the plur. ending *-ayyā'*; the forms of the demonstrative pronouns, etc. As the bulk of the population was of Arab race, it is not surprising that many of the proper names are Arabic and that several Arabic words occur in the inscriptions. The technical terms of municipal government are mostly Greek, transliterated into Palmyrene; a few Latin words occur, of course in Aramaic forms. The writing is a modified form of the old Aramaic character, and especially interesting because it represents almost the last stage through which the ancient alphabet passed before it developed into the Hebrew square character.

The names of the months were the same as those used by the Nabataeans, Syrians and later Jews, viz., the Babylonian. The calendar was practically a reproduction of the Julian, which Roman influence disseminated throughout Syria. Dates were reckoned by the Seleucid era, from October 312 B.C.

Religion.—The religion of Palmyra did not differ in essentials from that of the north Syrians and the Arab tribes of the eastern desert. The chief god of the Palmyrenes was a solar deity, called Samas or Shamash ("sun"), or Bel, or Malak-bel, transcribed Μαλαχβῆλος, Malagbelus (*NSI*. p. 268; Lidzbarski, *Ephemeris*, ii. pp. 84, 92), whose great temple is still the most imposing feature among the ruins of Palmyra. Both Bel and Malak-bel were of Babylonian origin. Sometimes associated with the Sun-god was 'Agli-bol the Moon-god, who is represented as a young Roman warrior with a large crescent attached to his shoulders (Chabot, *Choix d'Inscr. de Palmyre*, Pl. xix. 1). The great goddess of the Aramaeans, 'Athar-'atheh, in Greek Atargatis (*q.v.*), and Allath, the chief goddess of the ancient Arabs, were also worshipped at Palmyra. Another deity whose name occurs in votive inscriptions, is Baal-shamin, *i.e.*, "Baal of the heavens," = Ζεὺς μέγιστος κεραύνιος, sometimes called "lord of eternity." Another interesting divine name is that of a distinctly Arabic deity "She'a-alqūm the good and bountiful god who does not drink wine" (*NSI*. No. 140 B); the name means "he who accompanies, the protector of, the people"—the divine patron of the caravan. A common formula in Palmyrene dedications runs "To him whose name is blessed for ever, the good and the compassionate"; out of reverence the name of the deity was not pronounced; was it Bel or Malak-bel? It is worth noticing that this epithet like "lord of eternity" (or, "of the world"), has a distinctly Jewish character. Altogether about 22 names of gods are found in Palmyrene; some of them, however, only occur in compound proper names.

After its overthrow by Aurelian, Palmyra was partially revived as a military station by Diocletian (end of 3rd century A.D.), as we learn from a Latin inscription found on the site. Before this time Christianity had made its way into the oasis, for among the fathers present at the Council of Nicaea (A.D. 325) was Marinus bishop of Palmyra. The names of two other bishops (5th and 6th centuries) have come down to us and the foundations of two churches have been discovered, the larger of which, 148ft. by 88ft., may have held the seat of the bishop. About A.D. 400, Palmyra was the station of the first Illyrian legion (*Not. dign.* i. 85, ed. Böcking); Justinian in 527 furnished it with an aqueduct, and built the wall of which the ruins still remain (Procopius, *De aedif*, ii. 11). At the Moslem conquest of Syria, Palmyra capitulated to Khālid (*see* CALIPHATE) without embracing Islam (Yāqūt, i. 831). The town became a Moslem fortress and received a considerable Arab colony. The ruins of Palmyra greatly interested the Arabs, and are commemorated in several poems quoted by Yāqūt and others; they are referred to by the early poet Nābigha as proofs of the might of Solomon and his sovereignty over their builders the Jinn (Derenbourg, *Journ. As*. xii. 269). References to Palmyra in later times have been collected by Quatremère, *Sultans Mamlouks*, ii. pt. I. p. 255 *seq.* All but annihilated by earthquake in the 11th century, it recovered considerable prosperity; when Benjamin of Tudela visited the city,

which was still called Tadmor, he found 2,000 Jews within the walls (12th century). It was still a wealthy place as late as the 14th century; but in the general decline of the East, and owing to changes in the trade routes, it sunk at length to a poor group of hovels gathered in the courtyard of the Temple of the Sun. The ruins first became known to Europe through the visit of Dr. William Halifax of Aleppo in 1691 (see *PEFQ. St.* 1890). The architecture was carefully studied by Wood and Dawkins in 1751, whose splendid folio (*The Ruins of Palmyra*, London, 1753) also gave copies of inscriptions. But the epigraphic wealth of Palmyra was first opened to study by the collections of Waddington (vol. iii.) and De Vogué (*La Syrie centrale*) made in 1861–62. Since that time the most valuable document which has come to light is the great fiscal inscription discovered in 1882 by Prince Abamelek Lazarew.

See also J. Mordtmann, *Palmyrenisches* (1899); Clermont-Ganneau, *Études d'arch. or.* i., *Receuil d'arch or.* iii., v., vii., viii.; Lidzbarski, *Ephemeris*, i. and ii.; Sobernheim, *Palm. Inschr.* (1905). The *Répertoire d'épigr. sém* contains the new texts which have been published since 1900, and Chabot, *Choix d'Inscriptions de Palmyre*, 1922, a valuable collection of texts and photographs For the dialect, *see* Noldeke, *ZDMG.* xxiv. 85–109, and S A Cook *JQR.* xvi. 274 ff. Critical discussions of the history will be found in Mommsen, *Provinces of the Roman Empire*, (Eng trans, 1886), pp 92 *sqq.* An expedition was made in 1914 by Pères Jaussen and Savignac, under the auspices of the Académie des Inscriptions et Belles-Lettres; the report is given in the *Revue Biblique*, 1920, pp 359–419. The whole site is being explored afresh (1927) for the Académie by Prof. A. Gabriel, see *Syria*, viii. (1927) pp. 71–92. (G. A C.)

PALNI HILLS, a range of hills in south India, in the Madura district of Madras They are an offshoot from the Western Ghats, and, while distinct from the Anamalai hills, form part of the same system. They contain the hill station of Kodaikanal (7,200 ft) Coffee is cultivated on the lower slopes.

PALO ALTO, a city of Santa Clara county, California, U S A., on the San Francisco peninsula, 28 m S E. of the city and 18 m. from the ocean. It is served by the Southern Pacific railway and by motor-coach lines. Pop. 5,900 in 1920 (83% native white); estimated locally at 12,500 in 1928. It is a beautiful residential city, the seat of Stanford university (*q v.*), five military academies, several private preparatory schools and a U S. Veterans' hospital. Palo Alto was laid out in 1891 by Senator Stanford, as a university town, and was incorporated in 1894. In 1909 it was chartered as a city The name was suggested by an isolated redwood-tree which stood on the site.

PALO ALTO, a battlefield in Cameron county, Texas, between Point Isabel and Matamoras, about nine miles north-east of the latter. There on May 8, 1846, took place the first battle of the war between Mexico and the United States (1846–1848). Brigadier General Zachary Taylor's forces of some 2,200 regulars, in an effort to join with beleagered troops at Fort Brown, came upon a superior number of Mexicans (variously estimated between 4,000 and 6,000) under General Arista. Between the *chaparral* and the marshes the two lines were drawn up opposite each other, the Mexicans astride the road to Ft. Brown. Taylor's artillery, better handled than the Mexican heavy pieces, cut great swaths in the enemy's lines in process of forming. An attempt to turn the American right by a superior force of Mexican cavalry was met by a hollow square of the 5th Infantry. The grass was set on fire by the powder wads from the shells, so that a dense smoke screen kept the two armies from seeing each other well In this haze, the trained and disciplined subordinate leaders of the United States forces promptly met the Mexican attempt to encircle the left. Ringgold's and Duncan's batteries moved and fired handily in spite of the smoke. Because the battle began in the afternoon, there was not sufficient daylight for either side to have a decision. When darkness closed the issue for the day the Mexican loss was, according to estimate, about seven times that of the Americans. The engagement is interesting in that it was the first instance in United States history where superiority of training against an organized enemy rested with the Americans.

Ganoe, *The History of the United States Army* (1924). Original Correspondence and Reports in Old Files Section, Adjutant General's Office, Washington, D.C. (W. A. G.)

PALOLO WORM (*Leodice viridis*), a marine annelid worm of the order Polychaeta, native to the waters surrounding the Samoan and Fiji islands. At the full of the October moon it comes to the surface in immense numbers to breed and is caught in large quantities by the natives for food.

PALOMINO DE CASTRO Y VELASCO, ACISCLO ANTONIO (1653–1726), Spanish painter and writer on art. Although negligible as an artist, he produced a work on art, *El Museo pictorico y escala optica* (1715–24), the third volume of which is a mine of biographical material relating to Spanish artists. On the strength of this he has been called "the Spanish Vasari." The work was partially translated into English in 1739; an abridgment of the original (*Las Vidas de los pintores y estatuarios españoles*) was published in London in 1742, and afterwards appeared in a French translation in 1749. A German version was published at Dresden in 1781, and a reprint of the entire work at Madrid in 1797

PALO VERDE (*Cercidium Torreyanum*), a North American tree of the pea family (Leguminosae), native to the highly arid deserts of south-eastern California and adjacent Arizona and Mexico. It is a short-trunked, intricately branched tree, 15 to 20 ft. high, with smooth, conspicuously green bark and minute leaves which quickly wither and fall, their function being assumed by the green elements (chlorophyll) in the bark. The bright yellow flowers, borne in axillary clusters, are followed by bean-like pods about 3 in long The palo verde (Span *palo verde*, green tree) is a characteristic woody plant along washes in the Colorado desert.

PALTOCK, ROBERT (1697–1767), English writer, a Londoner by birth, owes his fame to his romantic *Life and Adventures of Peter Wilkins* (1751). It has been several times reprinted, notably with an introduction by A. H. Bullen in 1884. Paltock died in London on March 20, 1767.

PALUDAN-MÜLLER, FREDERIK (1809–1876), Danish poet, was the third son of Jens Paludan-Muller, from 1830 to 1845 bishop of Aarhus, and born at Kjerteminde in Fünen, on Feb. 7, 1809. In 1819 his father was transferred to Odense, and Frederik began to attend the Latin school there. In 1828 he passed to the university of Copenhagen In 1832 he opened his poetical career with *Four Romances*, and a successful romantic comedy entitled *Kjaerlighed ved hoffet* ("Love at Court"). This was succeeded in 1833 by *Dandserinden* ("The Dancing Girl"). He was not, however, well inspired in his lyrical drama of *Amor and Psyche* in 1834, nor in his Oriental tale of *Zuleimas flugt* ("Zuleima's Flight") in 1835, both written under the strong influence of Byron But he regained all that he had lost by his two volumes of poems in 1836 and 1838 From 1838 to 1840 Paludan-Muller was making the grand tour in Europe and his genius greatly expanded; in Italy he wrote *Venus*, a lyrical poem of extreme beauty. In the same year, 1841, he began to publish a great work on which he had long been engaged, and which he did not conclude until 1848; this was *Adam Homo*, a narrative epic, satirical, modern and descriptive, into which Paludan-Müller wove all his variegated impressions of Denmark and of love. This remains a Danish classic. In 1844 he composed three enchanting idylls, *Dryadens bryllup* ("The Dryad's Wedding"), *Tithon* ("Tithonus") and *Abels död* ("The Death of Abel"). From 1850 a certain decline in the poet's physical energy became manifest and he wrote less. His majestic drama of *Kalanus* belongs to 1854 Then for seven years he kept silence. *Paradiset* ("Paradise") 1861; and *Benedikt fra Nurcia* ("Benedict of Nurcia") 1861; bear evidence of malady, both physical and mental. Paludan-Müller wrote considerably after this, but never recovered his early raptures, except in the very latest of all his poems, the enchanting welcome to death, entitled *Adonis*. The poet died at Copenhagen on Dec. 27, 1876.

Paludan-Müller was also the author of two prose romances: *Ungdomskilden* ("The Fountain of Youth") (1865); and *Ivar Lykke's Historie* (3 vols., 1866–73). His *Poetiske Skrifter* (8 vols.) were published in 1878–79.

PALWAL, a town of British India, in Gurgaon district, Punjab. Pop. (1921), 9,352. It is a place of great antiquity, supposed to figure in the earliest Aryan traditions under the name of Apelava, part of the Pandava kingdom of Indraprastha.

PAMIERS, a town of southern France in the department of Ariège, 40 m. S. by E. of Toulouse on the railway to Foix. Pop. (1926) 9,777. Pamiers was originally a castle built in the early 12th century by Roger II., count of Foix, on lands of the abbey of St. Antonin de Frédelas. The abbots of St. Antonin, and afterwards the bishops, shared the authority over the town with the counts, which gave rise to numerous disputes. Pamiers was sacked by Jean de Foix in 1486, again during the religious wars, when the abbey of St. Antonin was destroyed, and finally in 1628, by Henry II. of Bourbon prince of Condé. Pamiers is the seat of a bishopric dating from the 13th century. The cathedral (chiefly 17th century) with an octagonal Gothic tower, is a mixture of the Graeco-Roman and Gothic styles; the church of Notre-Dame du Camp (17th and 18th centuries) has a crenelated and machicolated façade of the 13th century. Iron and steel of good quality are among its products. There are nursery gardens in the vicinity, and the white wine of the district is well known.

PAMIRS. The name of a chain of mountains in Central Asia. Our estimate of the extent of Pamir conformation depends much on the significance of the word Pamir. If we accept the Persian derivation of the term, *pai-mir,* or "the foot of mountain peaks," we have a definition which is by no means an inapt illustration of the actual facts of configuration. The plateau of Tibet and the uplands of the Pamirs are not analogous in physiography, and do not merge into each other. Littledale points out (*R.G.S. Journ.*, vol. vii.) that the high-level valleys of glacial formation which distinguish the Pamirs have no real counterpart in the Chang-t'ang or high plains of Tibet. The latter are 2,000 ft. higher, intersected by narrow ranges, are drained by no rivers of importance, but form a region of salt lakes and stagnant marshes, relieved by wide flat spaces of open plateau country. The absence of any vegetation beyond grass or scrub is a striking feature common to both Pamir and Chang-t'ang, but there the resemblance ceases, and the physical conformation of mountain and valley to the east and to the west of the upper sources of the Zarafshan is radically distinct.

The Pamirs are divided by the great meridional mountain chain of Sarikol with Muztag Ata (24,388 ft.). This chain divides the high-level sources of the Oxus on the west from the streams which sweep downwards into the Turkestan depression of Kashgar on the east. There are the true Pamirs (*i.e.*, valleys reaching up in long slopes to the foot of mountain peaks) on either side, and those on the west differ in some essential respects from those on the east. On the west the following are generally recognized as distinct Pamirs: (1) the Great Pamir, with Lake Victoria; (2) the Little Pamir, separated from the Great Pamir on the north by the Nicolas range; (3) the Pamir-i-Wakhan; the narrow trough of the Wakhan tributary of the Oxus, the term Pamir applying to its upper reaches only; (4) the Alichur—the Pamir of the Yeshil Kul and Ghund—immediately to the north of the Great Pamir; (5) the Sarez Pamir, the valley of the Murghab river, which has here found its way round the east of the Great Pamir and the Alichur from the Little Pamir, and now makes westwards for the Oxus. At the foot of the Sarez Pamir stands Murghabi. To the north-east of the Alichur are the Rang Kul and the Kara Kul Pamirs. Rang Kul lake occupies a central basin or depression; but the Kara Kul drains away north-eastwards through the Sarikol (as the latter, bending westwards, merges into the Trans-Alai) to Kashgar and the Turkestan plains. Similar characteristics distinguish all these Pamirs. They are hemmed in and separated by snow-capped mountain peaks and ridges, which are seamed with glaciers terminating in moraines. Long sweeps of grassy upland bestrewn with boulders lead from the streams up to the snowfields, yellow, grey or vivid green, according to season and the measure of sunlight, fold upon fold in interminable succession, their bleak monotony being only relieved by the grace of flowers for a short space during the summer.

To the east of the Sarikol chain is the Taghdumbash Pamir which claims many of the characteristics of the western Pamirs at its upper extremity, where the Karachukar, which drains it, is a comparatively small stream. But where the Karachukar, joining forces with the Khunjerab, flows northwards to Tashkurghan, dividing the two parallel ranges of Sarikol and Kandar, which together form the Sarikol chain, the appellation Pamir can hardly be maintained. This is the richest portion of the Sarikol province. Here are stone-built houses collected in scattered detachments, with a spread of cultivation reaching down to the river. Here are water-mills and many permanent appliances of civilization suited to the lower altitude (11,500 ft., the average height of the upper Pamirs being about 13,000), and here we are no longer near the sources of the river at the foot of the mountain peaks. One other so-called Pamir exists to the east of Sarikol, separated therefrom by the Kandar, which is known as Mariom or Mariong. But this Pamir is situated nowhere near the sources of the Zarafshan or Raskam river, which it borders, and possesses little in common with the Pamirs of the west. The Mariom Pamir defines the western extremity of the Kuen Lun, which stretches eastwards for 250 m. before it becomes the political boundary of northern Tibet.

The Muztagh Chain and Karakoram Extension.—The Muztagh chain, which holds within its grasp the mightiest system of glaciers in the world, forms a junction with the Sarikol at the head of the Taghdumbash, and also with the Hindu Kush. The political boundary between Kashmir and Sinkiang is carried by the Zarafshan or Raskam river to a point in about 79° 20′ E. where it is transferred to the watershed of the Kuen Lun. Within the limits of these partially explored highlands, lying between the Pamirs and the Tibetan table-land, exact geographical definition is impossible. Godwin-Austen considers the main chain of the Muztagh to merge into the central system of the Tibetan Chang-t'ang, its axis being defined and divided by the transverse stream of the Shyok at its westward bend; whilst the Karakoram range, in which the Shyok rises, is a subsidiary northern branch. The pass over the Karakoram (18,500 ft.) is the most formidable obstacle on the main trade route between Leh (*q.v.*) and Kashgar.

The Taghdumbash Pamir.—The Taghdumbash Pamir occupies a geographical position of some political significance. One important pass (the Beyik, 15,100 ft.) leads from the Russian Pamirs into Sarikol across its northern border. A second pass (the Wakhjir, 16,150 ft.) connects the head of the Wakhan valley of Afghanistan with the Sarikol province across its western head, whilst a third (the Kilik, 15,600 ft.) leads into the head of the Hunza river and opens a difficult and dangerous route to Gilgit.

Glacial Sources of the Oxus.—The true source of the Oxus probably lies in the snowfields of the Nicolas range and Lakes Chakmaktin (13,020 ft.) and Victoria (13,400 ft.) may be regarded as incidents, diminishing in volume day by day, in the course of glacial streams, rather than original springs or sources. The Nicolas glaciers also send down streams to the Panja or Wakhan river, below its junction with the ice stream from Wakhjir.

Climate and Population.—What is known of the climate of the Pamirs is based on observations taken at Pamirski Post, on the Murghab river. The rainfall is that of the steppe régime, most rain falling in late spring and early summer. The air is remarkably dry, especially in summer. The mean winter (January) temperature is $-1°$, and the mean summer temperature (July) 58°. A very strong south-west wind blows up the valleys by day throughout the year. There is much snow in the valley bottoms, but the ridges are snow free and without glaciers. At the height of 12,000 ft. the rainfall is only 2 in. per annum.

The population is mainly nomadic and includes a variety of "drifts" from various surrounding regions. The main element is usually called Pamiri, and is very broad-headed, with a white, fresh skin, often much bronzed, and abundant brown hair, inclined to be curly; the men have much face hair. The stature is slightly above the average (say 5 ft. 6½ in.), the nose is narrow, prominent and straight or aquiline, the eyes are straight, as in Europeans, and may be light. Among the Pamiri tribes the purest are the mountaineers called Galchas. To the south are Dardi elements

more related to the people of north-west India, but not usually with such extreme long heads as are found among the Rajputs and Sikhs. To the west occur the broad-headed Kirghiz, with yellowish-white skin, usually bronzed, very broad heads, large cheekbones, rather narrow noses, dark eyes of European type, and a tendency to stoutness. The first, or Pamiri type is, in practically every feature, akin to the Alpini type of Europe. Some of the Pamiri peoples are nearly related to the gypsies. There are Jews in the towns below the Pamirs.

The Kirghiz are Sunni Mohammedans, but are said to retain traces of ancient Nestorian Christianity in their ritual practices, and it is thought that a Christian bishopric survived at Yarkand till about a century after its presence there was noted by Marco Polo. The last Gurkhan of the Kara Kitai Empire in the early 13th century (the legendary Prester John) was a member of a Christian tribe named Naiman, mentioned by Ney Elias and claiming kinship with the Kipchaks.

Through the Pamirs have passed famous trade routes, *e.g.*, from Yarkand, via Tashkurgan and Rang Kul, to the stations in Turkistan north of the Oxus, or, via Tashkurgan and Lake Victoria, to Badakshan, while the Buddhist pilgrim route from Yarkand, and other cities of Sinkiang, across the Baroghil pass to Chitral, is also of historic importance.

Exploration.—Native explorers from India first began to be busy in the Pamirs about 1860, and in 1874 the mission of Sir D. Forsyth to Yarkand led to the first systematic geographical exploitation of the Pamir country. In 1885 Ney Elias made his famous journey across the Pamirs from east to west, identifying the Rang Kul as the Dragon lake of Chinese geographers—a distinction which has also been claimed by some geographers for Lake Victoria. Lockhart and Woodthorpe in 1886 passed along the Wakhan tributary of the Oxus from its head to Ishkashim in Badakshan, and completed an enduring record of most excellent geographical research. Bonvalot in 1887, Littledale in 1888, Cumberland, Bower and Dauvergne, followed by Younghusband in succeeding years, extending to 1890; Dunmore in 1892 and Sven Hedin in 1894–95, have all contributed to Pamir geography; but the honours of successful inquiry in those high altitudes still fall to the late Lord Curzon, whose researches in 1894 led to a singularly clear and comprehensive description of Pamir geography, as well as to the best map compilation made up to that time. Meanwhile Russian explorers and Russian topographers had been equally busy from the north. The famous soldier Skobelev was probably the first European to visit the Great Kara Kul. He was followed by scientific missions systematically organized by the Russian government. In 1883 Putiata's mission started south. Gromchevsky was hard at work from 1888 to 1892. Yano began again in 1891, after a short spell of rest, and has left his mark as a permanent record in the valley of Sarhad (or Wakhan), between the Baroghil pass and Bozai Gumbaz. Finally, in 1895, the Russian mission under General Shveikovsky met the British mission under General Gerard on the banks of Lake Victoria, and from that point to the Chinese frontier eastward demarcated the line which thereafter divided Russian from British interests in highest Asia.

PAMPA, LA, a territory of the southern pampas region of Argentina, bounded north by Mendoza, San Luis and Córdoba, east by Buenos Aires, south by the territory of Río Negro, from which it is separated by the river Colorado, and west by Mendoza. Pop. (1914) 101,338. It belongs geographically to the south-western part of the great Argentine pampas, from which its name is derived, but in reality only a part of its surface belongs to the plain region. The western and southern part (perhaps the larger) is much broken by hills, swamps and sandy wastes, with occasional stretches of wooded country. The western half is crossed by a broad depression, extending from Mendoza south-east to an intersection with the valley of the Colorado, which was once, perhaps, the outlet of the closed drainage basin occupied by the provinces of Mendoza, San Juan and San Luis. This depression is partially filled with swamps and lakes, into which flow the rivers Atuel and Salado. An obscure continuation of these rivers, called the Chadi-leubu, flows south-east from the great swamps into the large lake of Urrelauquén, about 60 m. north of the Colorado. There are a great number of lakes in La Pampa, especially in the south-east. The eastern half is described as fertile and well adapted for grazing, although the rainfall is very light. Since the closing years of the 19th century there has been a large migration of stock-raisers and agriculturists into La Pampa, and the territory has become an important producer of cattle and sheep, wheat, Indian corn, linseed, barley and alfalfa. The climate is dry, and the temperature ranges from the severe frosts of winter to an extreme of 104° F in summer. Strong, variable winds are characteristic of this region. Railways have been extended into the territory from Buenos Aires and Bahía Blanca, the latter being the nearest seaport. There is connection also with the Transandine railway line on the north. The capital is General Achá (pop. about 2,000), and the only other places of importance are Santa Rosa de Toay and Victorica, both small "camp" villages.

PAMPAS, an extensive plain of Argentina, extending from the Río Colorado north to the Gran Chaco, and from the foot-hills of the Andes east to the Paraná and Atlantic coast. There are other pampas in South America, such as the pampas de Aullagas, in Bolivia, the pampas del Sacramento between the Huallaga and Ucayali rivers in eastern Peru, and others less well known, but when pampas is used alone the great Argentine plain is meant.

The Argentine pampas was once the bed of an ancient sea, covered on the west by shingle and sand, and on the east by deposits of estuary silt. Its western and northern limits, formed by the foot-hills of the Andes, and by the south of the great forested depression of the Gran Chaco, cannot be accurately defined, but its area is estimated at 200,000 to 300,000 square miles. Its greatest breadth is across the south, between the 36th and 37th parallels, and its least in the north. It has a gradual slope from north-west to south-east, from an elevation above sea-level of 2,320 ft. at Mendoza to 20 ft. at Buenos Aires on the La Plata—the distance across being about 635 miles. Apart from a few *sierras* in the north-west and in the south, and a few longitudinal depressions in the west the plain appears perfectly level. The east, which is humid, fertile and grassy, has no natural arboreal growth, except in the vicinity of Córdoba and in the north, where algarrobas and some of the Chaco species are to be found. In the extreme south some species of low, thorny bushes cover considerable areas in the vicinity of the hill-ranges, otherwise the plain is destitute of native trees. Since the arrival of Europeans several species have been introduced successfully, such as the eucalyptus, poplar, peach, willow, *ombú* and others.

The distinctive vegetation of the grassy pampas is the tall, coarse-leaved "pampas grass" whose feathery spikes often reach a height of 8 or 9 feet. It covers large areas to the exclusion of all other species except the trefoils and herbs that grow between its tussocks. Since the advent of Europeans other forage plants have been introduced, the most successful being alfalfa (lucerne).

West of this region is a dry, sandy, semi-barren plain, called the "sterile pampas." It has large saline areas, brackish streams and lakes and immense sandy deserts, and in singular contrast to the fertile, treeless region of the east it supports large areas of stunted trees and thorny bushes. The grassy plains are well watered by streams flowing to the Paraná, La Plata and coast, though some of these are brackish.

Civilized occupation is working many changes in the character and appearance of the pampas. The first change was in the introduction of cattle and horses. Cattle were pastured on the open pampas and were guarded by men called *gauchos,* who became celebrated for their horsemanship, hardihood and lawlessness. Attention was then turned to sheep-breeding, which developed another and better type of plainsmen. Then followed the extensive cultivation of cereals, forage crops, etc., which led to the general use of fences, the employment of immigrant labourers, largely Italian and Spanish, the building of railways and the growth of towns. The picturesque gaucho is disappearing in the eastern provinces, and the herds are being driven farther inland.

PAMPERO, the cold south-west wind which blows over the great plains of southern Argentina. The term is somewhat loosely applied to any strong south-west wind in that region, but more strictly to a rain squall or thunderstorm arising suddenly in the

prevailing currents from north and north-east. Pamperos occur at Buenos Aires on an average about a dozen times in the year.

PAMPHILUS (1st century A.D.), a Greek grammarian, of the school of Aristarchus. He was the author of a comprehensive lexicon, in 95 books, of foreign or obscure words (γλῶτται ἤτοι λέξεις), the idea of which was credited to another grammarian, Zopyrion, himself the compiler of the first four books. The work itself is lost, but an epitome by Diogenianus (2nd century) formed the basis of the lexicon of Hesychius. A similar compilation, called Λειμών ("meadow") from its varied contents, dealing chiefly with mythological marvels, was probably a supplement to the lexicon.

See M. Schmidt, appendix to his edition of Hesychius (1862) vol. iv.

PAMPHLET, a small tract especially of topical interest (probably from Fr. *pamphilet,* derived from the 12th century poem *Pamphilus seu de amore*). The first use of the word is found in 1344 in Richard de Bury's *Philobiblon.* The leaflets and broadsides of the 15th and 16th centuries were concerned with religious controversy. In the 17th century the more familiar type of polemical pamphlet became common, famous examples being Milton's *Areopagitica,* and the anti-Cromwell tract *Killing no Murder* (1657). But it was not until the 18th century that the pamphlet first in the hands of Addison and Swift, and so down to Burke and Rousseau became a regular weapon of political controversy, the medium as well for a stately argument as for a bitter personal assault. Less pugnacious and less adroit in the 19th and 20th centuries, the pamphlet has become increasingly a means of propaganda. The corn laws, the Indian mutiny, Schleswig-Holstein, Irish home rule, the eastern question, vaticanism (and every sort of religious dispute), Dreyfus, tariff reform, prohibition, nationalization, etc.; all have produced a flood of pamphlet controversy. Generally speaking the pamphlet tends essentially to present one side of an argument and is usually more remarkable for its vigour than its balance.

PAMPHYLIA, the region in the south of Asia Minor, between Lycia and Cilicia, extending from the Mediterranean to Mt. Taurus. It was bounded on the north by Pisidia and was a country of small extent, having a coast-line of about 75 miles with a breadth of about 30 miles. There can be little doubt that the Pamphylians and Pisidians were originally the same people; but the distinction between the two seems to have been established at an early period. Herodotus, who does not mention the Pisidians, enumerates the Pamphylians (i. 28) among the nations of Asia Minor, while Ephorus mentions them both, correctly including the one among the nations on the coast, the other among those of the interior. The early Pamphylians, like the Lycians, had an alphabet of their own, partly Greek, partly "Asianic," which a few inscriptions on marble and coins preserve. Under the Romans the term Pamphylia was extended to include Pisidia and the whole tract up to the frontiers of Phrygia and Lycaonia. The country consisted almost entirely of a plain.

The chief towns on the coast were: Olbia, the first town in Pamphylia, near the Lycian frontier; Attaleia (*q.v.*); and Side (*q.v*). On a hill above the Eurymedon stood Aspendus (*q.v.*) and above the river Cestrus was Perga (*q.v.*). Between the two rivers, but somewhat farther inland, stood Sylleum, a strong fortress, which even ventured to defy the arms of Alexander. The coins of Aspendus, though of Greek character, bear legends in a barbarous dialect; and probably the Pamphylians were of Asiatic origin and mixed race. They became largely hellenized in Roman times, and have left magnificent memorials of their civilization at Perga, Aspendus and Side. The Pamphylians are first mentioned among the nations subdued by the Mermnad kings of Lydia, and afterwards passed in succession under the dominion of the Persian and Macedonian monarchs. After the defeat of Antiochus III. in 190 B.C. they were included among the provinces annexed by the Romans to the dominions of Eumenes of Pergamum; later they joined with the Pisidians and Cilicians in piratical ravages. Pamphylia was for a short time included in the dominions of Amyntas, king of Galatia, but after his death lapsed into a district of a Roman province.

See *Cambridge Ancient History,* vol. iii. (with useful bibliography); C. Lanckomiski, *Les Villes de la Pamphylie et de la Pisidie* (1890).

PAMPLONA, the capital of the Spanish province of Navarre, and an episcopal see; situated 1,387 ft. above sea-level, on the left bank of the Arga, a tributary of the Ebro. Pop. (1920) 32,635. Pamplona has a station on the Ebro railway connecting Alsasua with Saragossa. From its position it has always been the principal fortress of Navarre. Originally a town of the Vascones, Pamplona was rebuilt in 68 B.C. by Pompey the Great, whence the name Pompaelo or Pompelo (Strabo). It was captured by Euric the Goth in 466 and by the Franks under Childebert in 542; it was dismantled by Charlemagne in 778, but repulsed the emir of Saragossa in 907. In the 14th century it was greatly strengthened and beautified by Charles III., who built a citadel on the site now occupied by the Plaza de Toros and by the Basilica de S. Ignacio, the church marking the spot where Ignatius de Loyola received his wound in defending the place against André de Foix in 1521.

The citadel, south-west of the city, was constructed by order of Philip II. (1556–98), and was modelled on that of Antwerp. The cathedral is a late Gothic structure begun in 1397 by Charles III. (El Noble) of Navarre, who is buried within its walls; of the older Romanesque cathedral only a small portion of the cloisters remains. The fine interior is remarkable for the peculiar structure of its apse, and for the choir-stalls carved in English oak by Miguel Ancheta (1530). The principal façade is Corinthian, from designs of Ventura Rodriguez (1783). The same architect designed the aqueduct by which the city is supplied with water from Monte Francoa, some nine miles off. Pamplona has a flourishing agricultural trade, besides manufactures of cloth, linen stuffs, flour, soap, leather, cards, paper, earthenware, iron and nails. The yearly fair in connection with the feast of San Fermin (July 7), the patron saint of the city, attracts a large concourse.

PAN, an Arcadian deity who never attained any high moral development or prominent place in cult outside of Arcadia (Πάν, Doric contraction of *πάων, "pasturer," *cf.* Lat. *pa-sco;* but commonly supposed in antiquity to be connected with πᾶν "all"). His father is generally said to be Hermes; as his mother is often named PENELOPE (*q.v.*), probably not the wife of Odysseus, but commonly identified with her, hence one or another of the characters in the *Odyssey* is sometimes called his father. He is represented as more or less bestial in shape, generally having the horns, legs and ears of a goat; in later art the human parts of his form are much more emphasized, the bestial characteristics dwindling to a little pair of horns. His activities are those of a giver of fertility; hence he is represented as vigorous and lustful. His chief concern is with flocks and herds, not with agriculture; hence he can make men, like cattle, stampede in "panic" terror; like a shepherd, he is a piper, a late legend representing him as the lover of a nymph Syrinx ("pan-pipe"), who disappeared into a reed-bed when he pursued her, Pan making the first pipe from the reeds Like a shepherd, again, he rests at noon, and dislikes having his sleep disturbed; he can also send visions and dreams. Again like a shepherd, he haunts the high hills, and another late story makes him love or be loved by the nymph Pitys ("pine-tree").

Two picturesque stories are told of him. When the Athenians sent the runner Pheidippides (or Philippides) to ask help of Sparta before Marathon, he encountered Pan, who asked why Athens did not honour him, seeing that he was her friend and would be so again. After the battle, a cult of him was instituted (presumably because he had sent panic among the Persians). (*See* Herodotus, vi, 105.) In the time of Tiberius, one Thamus, pilot of a ship making for Italy, was thrice called by name and bidden to give the news that "great Pan was dead." (Plutarch, *de defect, orac.*, 17.) It is plausibly suggested by S. Reinach, although several scholars reject the idea, that what was really heard was Θαμοῦς Θαμοῦς Θαμοῦς πάμμεγας τέθνηκε ("Tammuz, Tammuz, Tammuz the all-great is dead"), a ritual lament for Thammuz-Adonis.[1]

See Immerwahr, *Kulte und Mythen Arkadiens* (1891); Roscher, *Lexikon, s.v.* (bibl.); L. R. Farnell, *Cults of the Greek States,* vol. v. (1909); H. J. Rose, *Handbook of Greek Mythology* (1928).

[1]*Cultes, Mythes et Religions,* of course Πάν μέγας and πάμμεγας would be practically indistinguishable in pronunciation.

PANA, a city of Christian county, Illinois, U.S.A., in the central part of the State; served by the Baltimore and Ohio, the Big Four, the Chicago and Eastern Illinois and the Illinois Central railways. Pop. (1920) 6,122 (86% native white). Coal-mining is the principal industry. Roses are grown, large quantities of hay and grain are shipped, and there are several factories. The city was incorporated in 1857. Its name is probably a corruption of Pani (Pawnee), the name of an Indian tribe.

PANAMA, a Latin American republic lying between Costa Rica and Colombia, and occupying portions of the two geographical divisions, Central and South America; the Panama canal, crossing the narrowest and lowest point of land between the Atlantic and Pacific oceans, bisects the republic from sea to sea. The republic lies approximately between 7° 15′ and 9° 39′ N. lat. and between 77° 15′ and 83° 30′ W. longitude. It is bounded on the north by the Caribbean sea, east by Colombia, south by the Bay of Panama and the Pacific ocean, and west by Costa Rica. The area is about 32,800 sq.m.; pop., exclusive of the Canal Zone (1927), about 446,000, or about 12 to the square mile. The coast line on the Atlantic side is 477 m. and on the Pacific 767 miles. The greatest length of the country is 420 m. and the greatest width 118 miles.

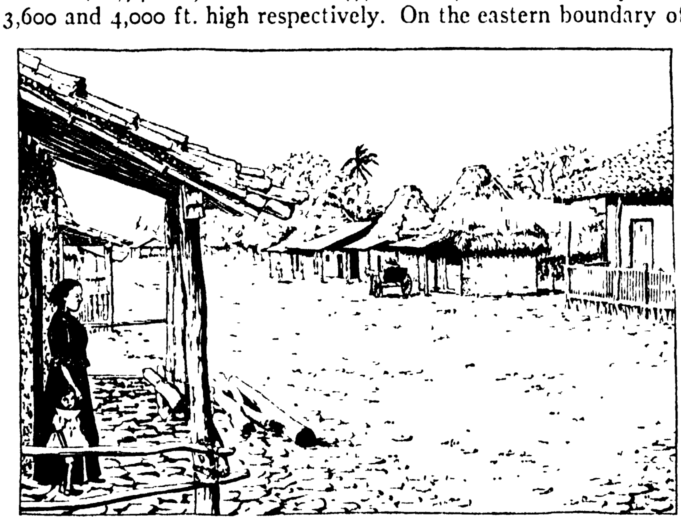
Physical Features.—The Isthmus of Panama, co-extensive with the republic, is the whole neck of land between the American continents; in another use the term "Isthmus of Panama" is applied to the narrow crossing between the cities of Colon and Panama, the other narrow crossings, further east, being the Isthmus of San Blas (31 m.) and the Isthmus of Darien (46 m.). The use of the term "Isthmus of Panama" to include the whole country is becoming more common. The Caribbean coast-line is concave, the Pacific deeply convex. The Mosquito gulf is to the north-west, the Gulf of Darien to the north-east, and on the north coast are several bays. Almirante bay, near the Costa Rican boundary, is 2 to 13 m. wide, with many islands and good anchorage, protected by Columbus island, about 8 m. long; immediately east of it, and connected with it, is Chiriqui lagoon (area about 320 sq.m.), 32 m. long, 12 m. wide at the widest point, with a maximum depth of 120 ft., protected on the sea side by Chiriqui archipelago; immediately east of Colon, at the narrowest part of the isthmus, is the Gulf of San Blas, protected by a peninsula and by the Mulatas archipelago and having the excellent harbour of Mandinga in the south-west; still farther east is Caledonia bay with another good harbour. On the north coast there are about 630 islands with a total area of about 150 square miles. The Pacific coast is deeply indented by the Gulf of Panama, which is 100 m. wide between Cape Garachine and Cape Malo, and has the Bay of Parita on its west side, north of Cape Malo, and the Gulf of San Miguel on its east side, north of Cape Garachine. Darien harbour, formed by the Tuira and Savannah rivers, is a part of the Gulf of San Miguel and is 11 m. long, 2 to 4 m. wide and nearly land-locked. In the Gulf of Panama there are 16 large and about 100 smaller islands (the Pearl islands), with a total area of 450 sq.m., the largest being Rey or San Miguel (15 m. long and 7 m. wide), and San José (25 sq.m.); both are well wooded. West of the Gulf of Panama and separated from it by Azuero peninsula is the Gulf of Montijo, 20 m. long and 14 m. wide at its mouth, across which stretches Cebaco island, 13½ m. long and 3 m. wide; west of Cebaco is Coiba. the largest island of the republic, 21 m. long and 4 to 12 m. wide. (W. Tho.)

Geology.—The surface everywhere shows great irregularity, produced by heavy rainfall, which has developed a mature drainage system, and by marine erosion, shown by bold, rugged islands, such as those in the Gulf of Panama. There have been no active volcanoes in Panama since Pliocene time. A record of the earthquakes that have occurred in Panama from the time of the Spanish conquest until 1886 shows only two severe shocks, one in 1621, the other in 1882. The line of volcanoes in Mexico and Central America probably dates from the end of Cretaceous time. Great volcanism, which was accompanied by orogenic changes, occurred in late Cretaceous and early Tertiary time.

Most of the mountains of Panama were formed not by folding due to lateral pressure, as nearly all the mountains of western America are, but by intrusions of volcanic rocks as irregular cores, sills and dikes. The intrusive rocks include basalt, diorite, andesite, granodiorite and rhyolite. They were injected in a molten condition through masses of volcanic agglomerate, breccia and tuff, and sedimentary beds of sandstone, argillite, limestone and shale, nearly all of Oligocene age. Most of the intrusions that formed basalt, andesite and rhyolite seem to have occurred in Miocene time. The diorite is at least in part probably Eocene.

The Isthmus appears to have been considerably uplifted and depressed during several geologic periods, some of the depressions carrying it below sea-level and thus uniting the Atlantic and the Pacific ocean and preventing the migration of land animals between North and South America. (G. McL. Wo.)

The country has no lakes; the apparent exceptions are the artificial lakes, Bohio (or Gatun) and Sosa, of the Canal Zone. There are a few swamps, especially on the northern shore. But the drainage is good; about 150 streams empty into the Caribbean and some 325 into the Pacific. In the eastern part are three complicated drainage systems of rivers very largely tidal. The largest is that of the Tuira (formerly called Rio Darien), whose headwaters are near the Caribbean and which empties into the Pacific in the Gulf of San Miguel. The Chepo (or Bayano) also is a digitate system with a drainage area reaching from the Caribbean to the Pacific; it is navigable for about 120 m. by small boats. The Chagres flows from a source near the Pacific south-west and then north to the Caribbean; is a little more than 100 m. long and is navigable for about half that distance; it varies greatly in depth, sometimes rising 35 ft. in 24 hours (at Gamboa), and drains about 1,000 sq.m. West of these three rivers are simpler and comparatively unimportant river systems, rising near the centre of the isthmus. Orographically the country is remarkable. The "exceedingly irregularly rounded, low-pointed mountains and hills covered by dense forests" (Hill) are Antillean, not Andean, and lie at right angles to the axes of the systems of North and South America. The only regular ranges in Panama are in the extreme western part where the Costa Rica divide continues into Panama, and, immediately south of this and parallel to it, the Cordillera of San Blas, or Sierra de Chiriqui, where the highest peaks are Chiriqui (11,265 ft.) and, on the Costa Rican boundary, Pico Blanco (11,740 ft.) and Rovalo (7,020 ft.); there are two passes, 3,600 and 4,000 ft. high respectively. On the eastern boundary of



BY COURTESY OF THE WASHINGTON OFFICE OF THE PANAMA CANAL

STREET IN CHORRERA, A TYPICAL TOWN OF THE INTERIOR OF PANAMA

the republic is the Serrania del Darien, an Andean range, partly in Colombia. The rough country between contains the following so-called "Sierras," which are not really ranges: in Veragua province, Sierra de Veragua, with Santiago (9,275 ft.) near the Chiriqui range, and Santa Maria (4,600 ft.), immediately north of the city of Santa Fé; in Los Santos province (Azuero Peninsula), bold hills rising 3,000 ft., and in Panama province, the much-broken Sierra de Panama, which has a maximum height of 1,700 ft. and a minimum, at the Culebra Pass, of 290 ft., the lowest point, except the interoceanic water-parting in Nicaragua,

which is 153 ft., in the western continental system. There have been no active volcanoes since the Pliocene Tertiary period, but the country is still subject to dangerous earthquakes. There are a few plains, like that of David, in Chiriqui province, but irregular surface is normal; and this irregularity is the result of very heavy rains with a consequent extremely developed drainage system cutting river valleys down nearly to the sea-level, and of marine erosion, as may be seen by the bold and rugged islands, notably those in the Gulf of Panama. It is improbable that there has been any connection by water between the two oceans here since Tertiary time.

Climate.—The climate of most of Panama is entirely tropical, with warm days and cooler nights, the temperature at Colon varying from 68° to 95° F; that for Panama is similar. The seasons are divided into wet and dry, the former from April to December, the rainfall being from 85 to 155 in. yearly. Panama was in former times literally a pest-hole from coast to coast. Yellow fever and malaria were endemic, and smallpox and other scourges followed in their wake. The country is now probably the most healthy spot in the tropics, thanks directly to the modern sanitation introduced by the American health authorities of the Canal Zone, whose authority is extended, by treaty, throughout the republic.

Inhabitants.—The population of 442,522 in 1923 was divided into racial classifications as follows: 52,069 whites, 85,970 negroes, 33,425 Indians, 3,061 orientals and 267,961 mestizos or mixed bloods. The population figures of Panama are always given as distinct from the population of the Canal Zone, which is U.S. leased territory. (*See* PANAMA CANAL.) The country is very cosmopolitan and grows more so each year, owing to the increasing traffic of the canal and the varied ships that come there. The lower strata of the city populations, particularly Colon, at the northern or Atlantic terminus of the canal, are negro, however, chiefly from the British West Indies, or their descendants.

Panama is marked for the concentration of its population in towns, the chief of these being Panama (*q.v.*), at the Pacific or southern end of the canal, whose port is Balboa, the American city on the canal proper and within the Canal Zone. Colon, at the northern end of the canal, has as its port and sister town in the Canal Zone, Cristobal, from which it is separated only by an imaginary line. Ancon, which adjoins and is virtually a part of Panama city, is the Canal Zone town corresponding to Cristobal in its relation with Colon, but Ancon is not a port. Other towns of historic or commercial importance are Porto Bello, east of Colon on the Caribbean, the scene of Columbus's ill-fated colony of Nombre de Dios, the terminus of the causeway which traversed the isthmus in Spanish colonial days and the loading port of galleons and thus the scene of the activities of the buccaneers; Bocas del Toro, now an important banana shipping centre; and David, the capital of Chiriqui Province, near the Pacific coast and Costa Rica.

Education.—Education is compulsory for children from 7 to 15 years of age. To furnish the facilities for making this law effective the Government had, in 1926, 446 schools, with 52,214 pupils and 1,492 teachers, and there were 71 private schools. The National institute or university had 1,573 pupils, the normal school for girls, 696. There is also an arts and crafts school for boys. The Bolivarian university, founded at one of the ceremonies of a conference of Pan-American States at Panama in 1926, has the support of Panama, Colombia, Ecuador and Peru.

Government.—The Panama Constitution was adopted on Feb. 13, 1904, and divides the Government into the three usual branches. The legislative power is vested in the national assembly, a single chamber with 46 members, elected for four years, a deputy for every 10,000 inhabitants. The president heads the executive, with a four-year term, and there is no vice president, the succession being provided by the selection by the national assembly, of three "designates" every two years. The president, elected Aug. 5,1928, was Florencio Harmodio Arosemena. The presidential cabinet consists of five ministers as follows: of government and justice, of foreign relations, of finance and the treasury, of public instruction and of agriculture and public works. The judiciary consists of a supreme court of five judges appointed by the president for a term of four years, a superior court, several circuit courts and various municipal courts. The judges of the superior and circuit courts are appointed by the supreme court for four years, the municipal judges by the circuit courts for one year.

Defence.—Panama has no army or navy, the police force being an efficient body organized originally and still directed by American officers. Under the treaty with the United States, that Government protects the isthmian republic from foreign aggression and intervenes in case of serious domestic strife, on the call of the president of Panàma.

Communications.—The Panama canal brings to Panama the largest tonnage of shipping of any country in Latin America, and its ports rival the great centres of the world. The chief railway is the Panama railroad, now owned by the U.S. Government, but originally built in 1849–55 by the American bankers and merchants, Howland and Aspinwall. When completed in 1855, it had cost $7,500,000; its length between termini is 47½ miles. The line was bought by the French Canal Company for $25,500,000, and was sold to the U.S. Government when the assets of the French company were purchased at the time the United States took over the construction of the canal. Another railway, in Chiriqui Province, comprising about 40 m., was completed in 1927–28 by President Arosemena, just prior to his election. The United Fruit Co. operates 151 m. of banana railway. The highways of Panama include a fine paved road from Panama city into Chiriqui Province, various highways in the Canal Zone, and the plans for highway construction include military roads of concrete throughout the Canal Zone, north and south into the adjacent territory, and across the country paralleling the canal.

Finance.—Panama's foreign debt is $16,000,000, contracted in 1928, chiefly for roads and other public works; $4,000,000 of this 1928 issue replaced an issue of similar amount put out for the same purpose in 1923. The U.S. Government pays Panama an annual rental of $250,000 on the Canal Zone, and the remainder of the income of the country comes from duties on imports and a few direct taxes. The Canal Zone constitutes a free zone, and the residents there, all of whom are employees of the U.S. Government, enjoy the privileges of purchase of duty-free supplies in the commissaries.

The monetary unit of Panama is the *balboa,* equal in value to the U.S. dollar, and although no gold balboas are in circulation, silver subsidiary coins are minted, although they are scarce. The circulating medium is chiefly U.S. currency. The half-balboa, or half-dollar, is sometimes called a *peso* and divided into an imaginary 100 centavos; 50 centavos, therefore, means 25 cents.

Panaman revenue and expenditures have risen gradually in recent years, the budget for 1927–28 being $2,979,682, more than double that of 1921–22.

Commerce and Trade.—The trans-shipment and transfer of goods at the Canal Zone ports do not appear in the movements of business in Panama, as such shipments are within the Canal Zone, and are under the regulations of free entry. The chief export of Panama is bananas, the 1924 figures showing an export value of $1,891,000, all going to the United States. Cacao is the second item of importance, the year's total exports being valued at $267,000. Coconuts were valued at $224,299, ivory nuts at $116,398 and pearls, once a great source of revenue and interest in Panama, $68,524. Mother-of-pearl exports were $68,472, and tortoise shell $85,308.

There are gold mines in Panama and other minerals of importance, but these are located chiefly in the difficult country of the interior, towards Colombia, and transportation is a serious problem. Oil has been found in this same region, and copper and iron have been located but not mined. There are two promising coal deposits, near Bocas del Toro and on the Golfo Dulce. The latter deposits also extend into Colombia, but neither has been developed. There are important salt mines at Parita bay on the Golfo Dulce.

History.—Panama had a distinctive and picturesque history antedating its independence from Colombia in 1903. The isthmus was the chief route of travel and of the shipment of treasure from

all of Latin America south of Mexico, and even the galleys from Manila trans-shipped their cargoes there. All of the South American provinces of Spain were reached via Panama; even the provinces of the Rio de la Plata, now Argentina and Uruguay, sent their produce and received their supplies and mails overland through Peru and thence up the Pacific coast to Panama. The isthmus was probably visited by Alonso de Ojeda in 1499, and in 1501 Rodrigo Bastidas, coasting the northern border of South America from Venezuela westward, reached Porto Bello. Columbus in 1502 entered the mighty gulf which was named in his honour, Admiral or Almirante bay. He planted the colony, Nombre de Dios, at Porto Bello, but this was destroyed by the hostile Indians as soon as he had sailed away. In 1510, it was re-established by Diego de Nicuessa, the first governor of the Province of Castilla del Oro, including most of Panama, Costa Rica, and part of Nicaragua. In the same year, Darien colony (originally called Santa María de la Antigua del Darien) was founded by Martín Fernández de Enciso. In December of that year, an insurrection against Enciso put Vasco Nuñez de Balboa in command of the province. Balboa, who had been in Panama since 1501, gradually pushing his fortunes upward, crossed the isthmus in 1513 and discovered the Pacific ocean, lying to the southward of the coastline; he named it the Southern ocean, and took possession of it in the name of the King of Spain, on Sept. 25 or 26.

Pedro Arias de Avila, sent out from Spain to succeed Enciso, displaced Balboa, and uniting the provinces of Nueva Andalucía and Castilla del Oro, established that of Tierra Firma in 1514, and in 1519 founded the city of Panama. Panama became the terminus of transport across the isthmus, with Porto Bello at the eastern or rather the northern end; a paved causeway was built and pack animals and slaves carried the unrecorded treasures of the Indies along the road. Pirates came again and again to waylay the caravans, to lay siege to the ports of Panama and Porto Bello, and to sack and burn both at various times. William Paterson (*q.v.*) established in 1698 a Scottish settlement at what is still known as Porto Escocés in the north-east, but in 1700 the Spaniards expelled the remaining members.

In 1718, when the viceroyalty of Nueva Granada was created, Panama was incorporated under its administration and throughout the various vicissitudes of the independence period was regarded as but one province of Nueva Granada in the Colombian federation. In 1841, however, Panama seceded, with the neighbouring Province of Veragua, setting up the independent State of the Isthmus of Panama. Colombia quelled the rebellion, but in 1853, under the new Granadine Confederation, from which the States had a right to withdraw, Panama again seceded, but later returned. In 1885 Panama was bitterly resentful of the action of President Nuñez, in overriding the 1863 Constitution recognizing the sovereignty of the States of Colombia, and the 1886 Constitution was adopted without Panama being heard; it changed Panama from a State to a department and vested its government in Federal appointees. When the French Canal Company began activities, Panama was a rich field for corrupt officials, and the people suffered considerably at the hands of many of the appointees from Bogota. In 1895 there was an abortive uprising, and from 1898 to 1903 the province was in continual revolt.

The treaty of the United States and Colombia in 1846, allowing the United States the right of transport across the isthmus and guaranteeing, on the part of the United States, the sovereignty of Nueva Granada on the isthmus, early brought the United States into the Panaman situation. In 1901, the Hay-Pauncefote Treaty settled the right of the United States to build the canal and to control it, alone. Negotiations were begun with Colombia for the site and authority, and in Jan. 1903, the Hay-Herran treaty was finally signed. The Colombian Congress delayed ratification, possibly in the hope of securing better terms, possibly waiting for the expiration of the French concession, when the sums which the United States had agreed to pay the French company would possibly be available for Colombian interests. The session of Congress called to ratify the treaty adjourned without doing so on October 31. On Nov. 3, the independence of Panama was declared in Panama City, and the revolutionary activities of Panama surged up. The Colombian troops, landed at Colon to cross the isthmus and engage the revolutionists, were stopped by 47 marines of the U.S. cruiser "Nashville," under the provisions of the treaty of 1846, on the ground that in that document the United States had guaranteed to keep the isthmus open, and civil war would close it. Meanwhile, on Nov. 7, the Panaman minister was received in Washington, and on Nov. 18 a treaty was signed between the United States and the new republic, ceding the Canal Zone for a payment of $10,000,000 and $250,000 annual rental. The Panaman Government was organized and a constitutional assembly met on Jan. 15, 1904, when the present Constitution was drawn up. The haste with which President Roosevelt recognized the new republic has been the subject of wide criticism, and the payment to Colombia, after 1923, of $25,000,000 was taken in some quarters as acknowledgment of the fault, but this payment was officially made in settlement of various claims for the use of Colombian property and to clear title to the physical properties of the canal.

The relations of the United States and Panama in connection with the canal have been, on the whole, extremely cordial. The two countries have carried on their affairs through the medium of the treaty of 1904 and the so-called Taft Agreement, a series of orders issued by William Howard Taft while secretary of war under President Roosevelt. These were regarded by Panama as outgrown, however, and in 1922, the question of a new treaty, replacing that of Feb. 23, 1904, and the Taft Agreement, was taken up. A treaty was finally signed in 1927, in Washington, but the Panaman Congress has not ratified it. The difficulties are chiefly connected with the commercial administration of the Canal Zone, under which civilian employees of the United States are allowed to buy from the commissary instead of in Panama, where duty is collected on imported goods. Limitation of the right of eminent domain, a definite settling of the final extensions of the Canal Zone, and finally a determination of the sovereignty of the Canal Zone, are involved.

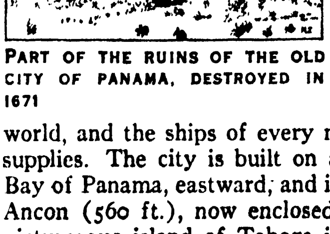
PANAMA, capital of the Republic of Panama, located at the southern or Pacific terminus of the Panama canal. Panama is the oldest settlement on the continental Western Hemisphere, having been founded in 1519 by Pedro Arias de Avila. It is the southern terminus of the Panama railroad, 47½ m. from Colon. Pop. (1926) 59,458, excluding, of course, the population of the adjoining American town of Ancon, within the Canal Zone. Panama city is virtually surrounded by the Canal Zone. It is connected by a road with the site of the ancient city, which was destroyed by Sir Henry Morgan in 1671.



PART OF THE RUINS OF THE OLD CITY OF PANAMA, DESTROYED IN 1671

Through its port of Balboa, in the Canal Zone, Panama is in communication with the whole world, and the ships of every nation stop there to load coal and supplies. The city is built on a rocky peninsula jutting into the Bay of Panama, eastward, and its most commanding site is Mount Ancon (560 ft.), now enclosed within the Canal Zone, and the picturesque island of Taboga in the harbour (935 ft.). Taboga was one of the sites taken over by the United States for canal defence during the war and has been one of the issues brought up by Panama in the negotiation of the new treaty. (*See* PANAMA and PANAMA CANAL ZONE.)

Panama was, during the early Spanish régime, strongly fortified and richly endowed with buildings and churches. It was the storehouse of the gold and silver from South America and the treasures of the Orient, and was the envy of the pirates and buccaneers. The ruins of the old city, destroyed in 1671, are still standing and are the object of tourist visits. The site was removed 5 m. west and the town was rebuilt in 1673 by Alfonso Mercado de Villacorta, to be nearer the port. The new city was entirely surrounded by a granite wall, whose remains are still landmarks in the modern city and a portion of which, along the sea, is a famous promenade, Las Bovedas. The streets of the old town are narrow and tortuous, and automobiles have complicated an already difficult traffic problem. There are several old squares, the four chief centres being Cathedral, Santa Ana, Bolivar and de Lesseps. The old cathedral was built in 1760, and is a handsome landmark. Other public buildings include the new Government palace, on the water front, the municipal palace, the episcopal palace, the church of Santa Ana, the national theatre, school of arts and crafts, a handsome new railway station, various old office buildings and colonial residences. The prevailing architecture is stone, flat or red tile roofed, two or three storeys high. The streets are well lighted and paved in the central portion and the tramways system is adequate. The water supply and drainage were established by the U.S. Government engineers, and are maintained by them.

THE SEA WALL AT PLAZA DE FRANCIA, CITY OF PANAMA

Ancon, including the residence of American officials, the Canal Zone hospitals and administration buildings, and the large hotel operated by the U.S. Government for travelers, adjoins Panama, while Balboa, the actual port (formerly called La Boca), is on the canal and entirely within the Canal Zone; it is connected with Panama by railway and tram-line. (W. THO.)

PANAMA CANAL, the canal connecting the Atlantic and Pacific oceans through the narrow isthmus of Panama, where the Continental Divide dips to one of its lowest points. Its length from shore line to shore line is 40·27 m., and from deep water in the Atlantic to deep water in the Pacific 50·72 miles. The canal does not, as is generally supposed, cross the isthmus from east to west. It runs due south from its entrance in Limon bay, through the Gatun locks to a point in the widest portion of Gatun lake, a distance of 11½ m.; it then turns sharply toward the east and follows a course generally south-east till it reaches the Bay of Panama, on the Pacific side. Its terminus near Panama is about 22½ m. E. of its terminus near Colon. In passing from the Atlantic to the Pacific a vessel enters the approach channel in Limon bay, which has a bottom width of 500 ft. and extends to Gatun locks, a distance of 6⅗ miles. At Gatun it enters a series of three locks in flight which lift it 85 feet. It then enters upon Gatun lake which covers an area of 164 sq.m. with a depth varying from 45 to 87 feet. The channel within the lake varies from 500 to 1,000 ft. in width for a distance of nearly 24 m. to Gamboa, where the Gaillard (Culebra) cut begins. The channel through the cut, a distance of about 8 m., has a bottom width of 300 ft. and a depth of 45 ft., and extends to the locks at Pedro Miguel, the Pacific end of the water bridge. At Pedro Miguel the vessel is lowered in the single lock 31 ft. to a small lake, at an elevation of 54 ft. above sea-level, through which the vessel passes one mile to the two locks at Miraflores. These lower it to sea-level, and through an approach passage 8 m. long, with a bottom width of 500 ft., it passes into the Pacific. The locks are duplicate or "double-barrelled" so that ships may be passed in opposite directions simultaneously. The cut has eight angles and at these the channel is widened sufficiently to allow a 1,000-ft. vessel to make the turn. In the whole canal there are 22 angles, the total curvature being 600° 54′. The sharpest curve is 67° 11′. A thorough system of lights and buoys makes the canal as safe to use at night as by day.

Gatun Dam.—The largest dam is at Gatun, on the Atlantic side. It spans the northern and lower end of a deep valley through which the Chagres river formerly flowed to the sea. It is 1½ m. long measured on its crest, ½ m. wide at the base, 400 ft. wide at the water surface, 100 ft. wide at the top; and its crest is at an elevation of 105 ft. above sea-level. It is really two dams in one, for in its centre there is a natural hill or rock 110 ft. high. In this the spillway of the dam is constructed, and against its two sides rest the two sections of the great dam. The dam itself contains 23,000,000 cu.yd. of material. The spillway is a concrete-lined channel, 1,200 ft. long and 285 ft. wide, the bottom being 10 ft. above sea-level, sloping to sea-level at the lower end.

Across the lake-opening of the channel is a concrete dam in the form of an arc of a circle, making its length 808 ft., although it closes a channel with a width of only 285 feet. The crest of this dam is 69 ft. above sea-level, or 16 ft. below the normal level of the lake. On the crest are 13 concrete piers with their tops 115·5 ft. above sea-level, and between these are 14 regulating gates of the Stoney type which move up and down on roller trains in niches in the piers. The gates permit a discharge of water greater than the maximum known discharge of the Chagres river during a flood. Near the north wall of the spillway is a hydro-electric station capable of generating, through turbines which are supplied with water from the lake through a forebay, sufficient electricity to meet all demands, including the lighting of the canal and all canal zone towns and buildings; the machinery of the locks, the machine shops, dry-dock and coal-handling plant; and the telephone and telegraph systems. There is an emergency Diesel electric plant at Miraflores.

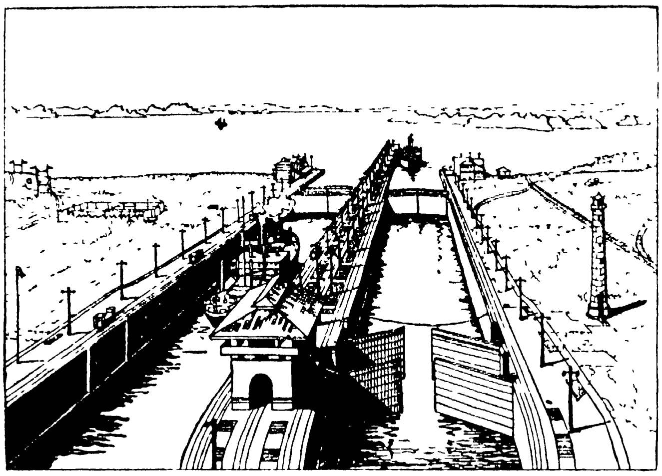
GATUN MIDDLE AND LOWER LOCKS IN PROCESS OF CONSTRUCTION, 1913, WITH ATLANTIC ENTRANCE IN THE BACKGROUND

Dams on the Pacific Side.—At Pedro Miguel, at the south or Pacific end of the cut, the water is held at summit level (level of Gatun lake and the cut, normally 85 ft. above the sea) by Pedro Miguel lock and two flanking dams extending from the side walls of the lock to hills on either side The distance between the hills at elevation 92 ft. is 2,000 feet. The situation of the lock at the base of Cerro Luisa made it practicable to connect



BY COURTESY OF THE WASHINGTON OFFICE OF THE PANAMA CANAL
GATUN LOCKS, LOOKING SOUTH FROM MIDDLE CHAMBER TOWARD ATLANTIC OCEAN, AFTER COMPLETION

with that hill by a short concrete wall, 260 ft in length, subsequently covered with earth On the west side a rock and earthen dam was built with a puddled and rolled impervious core, 1,400 ft in length. The Pedro Miguel lock raises or lowers ships 31 ft. —the difference between the summit level of 85 ft. and the normal surface of Miraflores lake—54 ft. above sea-level The Miraflores lake is a mile in length, and its waters are retained by the Miraflores locks and flanking dams. The east dam at Miraflores is of concrete, and the greater part of it is the spillway of Miraflores lake. This spillway is 432 ft in length, with the crest of its dam 38 67 ft above sea-level, and the supporting piers for the gates rising to 85 17 ft above sea-level. Eight gates, similar to those in the Gatun Spillway, each 47 ft. 10¾ in long by 19 ft in height, and weighing 44 tons each are used; but the dam at Miraflores is straight, instead of being in the form of an arc, as at Gatun. The west dam at Miraflores is of earth and rock and extends almost parallel with the axis of the locks to a hill to the south. Its length is 2,300 ft, top 70 ft above sea-level, width of top 40 ft, and slope of sides approximately 12 to 1.

The Locks.—All locks are in duplicate, constructed in the same manner, and their chambers, with walls and floors of concrete, have the same usable dimensions—1,000 ft long and 110 ft wide. There are six pairs, making 12 in all The side walls are from 45 to 50 ft. wide at the surface of the floor, are vertical on the chamber side, and narrowed on the outside from a point 24½ ft. from the floor, by means of a series of steps each 6 ft. long, to a width of 8 ft. at the top. A culvert 254 sq ft. in cross-section, extends the entire length of each middle and side wall, and from each of these large culverts, smaller culverts, 33 to 44 sq ft. extend to holes in the floors. Fifteen feet above the top of the culvert in the middle wall there is a U-shaped space 19 ft wide at the bottom and 44 ft. at the top. This space is divided into three storeys; the lowest for drainage; the middle for wires that carry the electric current to operate the gates and valve machinery installed in the centre wall; and the upper a passage-way for the operators All lock walls are 81 ft. high, except in the lower pair of locks at Miraflores, where they are 82 ft. because of the extreme tidal oscillations of about 21 ft. in the Bay of Panama. In the walls at Gatun there are 2,068,000 cu yd. of concrete, and in those on the Pacific side 2,440,000 cu. yards. All lock walls rest on rock foundations. The approach wall at the north entrance at Gatun, 1,031 ft. long, rests upon piles driven from 35 to 70 ft. into the earth; that at the south or lake entrance 1,009 ft. long, rests on piles reaching to rock, in some places over 100 ft. below sea-level.

Lock Gates.—The lock gates, each composed of two leaves, are 65 ft. wide, from 47 ft. 4 in. to 82 ft. high, 7 ft. thick, and weigh from 390 to 730 tons. Each is a huge webbed steel box, the girders of which are covered with a steel sheathing. All portions of the interior are accessible, with watertight compartments providing for the adjustment of the buoyancy so as to control within limits the dead load on the bearings, making the leaf practically float in the water. This watertight compartment is subdivided vertically into three sections, each independently watertight, so that if the shell should be broken or leak, probably only one section would be affected. An air shaft, 26 in. in diameter, runs from the bottom compartment up to the top of the gate, and is also watertight where it passes through the upper half of the leaf.

The girders are made with manholes through the webs, providing communication from the top to the bottom of the leaf, and are connected by several sets of vertical transverse diaphragms of solid plates, running from top to bottom of the leaf, thus making a cellular construction, and dividing the spaces between the horizontal girders into small pockets, all of which are accessible through manholes Each leaf rests at the bottom of its heel post upon a hemispherical pivot of forged nickel steel, and is hinged at the top to the masonry of the lock wall It swings free on the pivot like a door, without wheels or other support beneath it Intermediate gates are used in all except one pair of locks, and divide the space into two chambers, one 600 and the other 400 ft. in length. This makes possible a saving of water and time in locking small vessels through, for 95% of the vessels navigating the high seas are less than 600 ft in length. The highest gates and the highest lock walls on the canal are those of the lower locks at Miraflores, and these locks are the only ones which have no intermediate gates. The depth of water on the mitre sills is 40 feet

The locks are filled and emptied through the large and smaller culverts. The large culverts are controlled at points near the gates by large valves, and each of the small culverts feeds in both directions through the laterals, thus permitting the passage of water from one twin lock to another, effecting a saving of water if desired. The average time required to fill or empty a lock chamber is 8 min. if both centre and side wall culverts are used, and 12 min. if only one culvert is used The average time to pass a vessel through the three flights at Gatun locks is an hour, from arrival to clearance; for the one lift at Pedro Miguel half an hour, and for the two flights at Miraflores three-quarters of

BY COURTESY OF THE WASHINGTON OFFICE OF THE PANAMA CANAL
SHIP-DISPATCHING AT WEST LIRIO SLIDE IN THE PANAMA CANAL
Southbound shipping is waiting at Empire mooring on left bank while northbound ships pass in close formation under slide emergency schedule

an hour The time of passage of a vessel from one terminal port of the canal to the other is 7 hours

Passage of Locks.—With the exception of small craft no vessel can pass through the locks under its own power. On arrival at the locks it is taken in tow by towing locomotives or "electric mules." These locomotives operate on cog tracks on the lock walls at the rate of 2 m. an hour. The usual number required for a vessel is six: two ahead, one on each wall, two slightly forward of amidships, one on each side, the four imparting forward motion to the vessel; and two astern aid in keeping the vessel in a

central position and in bringing it to rest within the chamber while the emptying or filling is carried on.

Before a lock can be entered, a fender chain, stretched across the walls of the approach, must be passed. If all is proceeding properly, this chain is dropped into its groove at the bottom of the channel. If by any chance the ship is moving too rapidly for safety, the chain remains stretched and the vessel runs against it. The chain, which is operated by hydraulic machinery in the walls, then pays out slowly by automatic release until the vessel is brought to a stop If the vessel should get away from the towing locomotive and, breaking through the chain, ram the first gate, there is a second gate 50 ft away, protecting the lock, which arrests further advance. When the leaves of this gate swing open, the vessel is towed in, and the gate is closed behind it Then, from 105 openings placed at regular intervals in the lock floor, water pours in, lifting the vessel to the level of the lock above

The gates are opened and closed by a powerful machine invented by Edward Schildhauer, an electrical engineer in the employ of the Isthmian Canal Commission. It consists of a crank gear or wheel moving through an arc of 197°, placed horizontally in the lock wall. To the outer rim of the wheel is attached a strut or connecting rod which is fastened to the top of a lock gate 17 ft. from the pintle or hinge. When the wheel turns in either direction the gate leaf is opened or shut, the operation taking two minutes. The crank gear, constructed of cast steel, is 19 ft 2 in in diameter and weighs approximately 35,000 pounds. It is connected with an electric motor, and a small electric switch sets it in motion Every operation in the passage of a vessel through the lock, except the movements of the towing locomotives, is controlled by one man in a building at the top of the centre wall commanding an unobstructed view of every part of the locks.

Breakwaters.—Long breakwaters have been constructed near the approach channels in both oceans. One in Limon bay, or Colon harbour, called the west breakwater, is 11,526 ft. in length, 15 ft wide at the top and 10 ft above mean sea-level. A second, also in Limon bay, known as the east breakwater, is without land connection, one mile in length and runs in an easterly direction at nearly a right angle with the canal channel It has a lighthouse on the channel end The west breakwater protects the harbour against severe gales, while the east breakwater prevents silting in the canal channel. The breakwater at the Pacific entrance extends from Balboa to Naos island, a distance of 17,000 feet. It was constructed for a twofold purpose first, to divert cross-currents that would carry soft material from the shallow harbour of Panama into the Canal channel, second, to furnish rail connection between the islands and the mainland

ACCESSORIES

Permanent Canal Buildings.—Upon the completion of the canal a number of villages along the line occupied during the construction days were abandoned, the sites of several being covered by the filling of Gatun lake. The buildings in good condition were transferred to the permanent towns located at the ends of the canal and adjoining the locks. Culebra, the former headquarters of operations, situated on the west bank of the cut near its deepest part, was turned into an army post The permanent headquarters were located at Balboa Heights, and the offices of the departments centred in a large 3-storey concrete administration building situated on a hill 100 ft. above sea-level, and overlooking the Pacific entrance to the canal. On the hill in the rear of this building are the residences of the governor and other officials. On the low land in front of the building, in a site which was formerly a tidal swamp and was raised to 20 ft above sea-level by filling with material from the Cut and hydraulic fill from excavation in the harbour, is the town of Balboa. This is laid out on both sides of a central avenue called the Prado, and contains permanent buildings of concrete blocks roofed with red tile. In addition to the dwellings of employees there are a police station, post office, fire-station, sanitary office, dispensary, clubhouse, a community house conducted by the Catholic Church, an army and navy Y.M.C.A., restaurant, churches, lodge hall, schoolhouses and playground.

Terminal Facilities.—At the ports on both oceans have been constructed facilities ample for commercial shipping and the naval needs of the United States. Modern piers, 1,200 ft. in length by 240 ft. in width, with enclosed sheds, built of reinforced concrete and steel, are ample for the transshipping of cargo and the storage of goods consigned there for orders At the Pacific end, at the foot of Sosa Hill, Balboa, are marine and railway repair shops, foundry, etc., covering 60 ac., thoroughly equipped and including a dry dock having a usable length of 1,000 ft and entrance width of 110 ft, capable, like the locks and other parts of the canal, of accommodating any vessel afloat The depth over keel blocks is 43 ft. at mean tide Smaller shops and a dry dock 300 ft long and 48 ft wide with depth of 13½ ft. are operated at the Atlantic end. Coaling plants capable of rapid bunkering are operated at both terminals, as well as oil-pumping plants connected with storage tanks for fuel oil, Diesel oil and gasolene Storehouses supply all kinds of ship chandlery and repair material, as well as foodstuffs, beef and other fresh meats and cold storage supplies ice, etc Ships' every need of repair or supply can be met Radio stations for communication with ships are operated by the United States navy at Cristobal and Balboa, and also at Cape Mala, 90 m S of the Pacific entrance, and a high-power station, primarily for Government communication with the United States, is situated at Darien, midway of the isthmus Salvage tugs and other wrecking equipment are available for use of vessels within a radius of 1,000 m. or more of the canal. Hotels and hospitals are situated at both terminals

Fortifications and Military Occupation.—By executive order dated Dec. 5, 1912, President Taft declared that "all land and land under water within the limits of the canal zone are necessary for the construction, maintenance, operation, protection, and sanitation of the Panama canal," and title to all such land was acquired by the Government of the United States The canal zone is thus a military reservation, and the only activities carried on by other than Government forces are on land rented to steamship interests and to agriculturists under revocable licences. Heavy fortifications have been built at both entrances to the canal and brigade posts established near the locks Both the army and the navy have aerial forces at the canal, and a base for submarines is maintained at the Atlantic end The total military force is 10,000 men.

Panama Railroad.—The Panama Railroad extends between Colón and Panama on the eastern side of the canal, and is 47.61 m long The railroad as built in 1850–55 followed the course of the Chagres from Gatun to Gamboa, and was for the most part on the west side of the route of the Canal With the building of the canal it was necessary to relocate the railroad throughout practically its whole length The construction of the original railroad was done by an American company under great difficulties, its completion antedated by 14 years the completion of the first transcontinental railroad in the United States The railroad was an essential factor in the construction of the canal, and is an important adjunct to its operations It is equipped with 90-lb rails, rock-ballasted track, and automatic signals It uses modern American rolling-stock, including oil-burning locomotives

ADMINISTRATION AND FINANCE

Under an act of Congress, approved on Aug 24, 1912, the Panama canal is governed and operated, and the canal zone is governed through a governor of the Panama canal, appointed by the president, with the approval of the senate, for a term of four years, at a salary of $10,000 a year. In addition to the operation of the canal, the governor has official control and jurisdiction over the canal zone and performs all duties in connection with its civil government, it being held, treated and governed as an adjunct to the canal. There is one United States District court in the canal zone, with the same jurisdiction and procedure as the same courts in the United States, the judge of which is appointed by the president. Appeals are made to the Circuit Court of Appeals of the Fifth Circuit of the United States. At Balboa and Cristobal there is a magistrate's court for minor cases, the judges being appointed by the governor. General Goethals was the first

governor and served until Jan. 11, 1917, when he resigned and was succeeded by Col. Chester Harding, U.S.A., who held the office until March 27, 1921, when he was succeeded by Col. Jay J. Morrow, U.S.A. The latter resigned in Oct. 1924, and was succeeded by Col. Meriwether L. Walker, U.S.A.

The organization on the Isthmus includes a number of departments and divisions in charge of the various activities, as follows: Department of Operation and Maintenance, including the Marine Division, Mechanical Division, Dredging Division, Section of Lock Operation, Electrical Division, Division of Municipal Engineering, Fortifications Division, and several sections; the Supply Department, made up of the Quartermaster section, Subsistence section, Commissary Division, Cattle Industry and Plantations, and Hotel Washington; the Accounting Department, the Health Department; the Executive Department and the Panama Railroad. The Panama canal has an office in Washington, D.C., and the Panama Railroad company has an office at 24 State street, New York.

A census of the canal zone taken in June 1928 showed a total civil population of 28,002. The civilians included 2,421 adult male Americans, 2,492 American women, 2,569 American children and people of other nationalities as follows: men, 6,904; women, 4,516; children, 9,100. The working force at the end of Dec. 1927 numbered 13,478, of whom 2,979 were Americans, chiefly in official and clerical positions and skilled trades, and 10,499 were alien labourers, chiefly West Indian negroes.

Tolls.—The Hay-Pauncefote Treaty between Great Britain and the United States, abrogating and succeeding the Clayton-Bulwer Treaty, was ratified on Dec. 16, 1901. It contained this clause:

The Canal shall be free and open to the vessels of commerce and of war of all nations observing these rules, on terms of entire equality, so that there shall be no discrimination against any such nation or its citizens or subjects in respect of the conditions or charges of traffic or otherwise. Such conditions and charges of traffic shall be just and equitable.

In 1912 Congress passed an act for the operation and government of the Panama canal, which contained the provision that "no tolls shall be levied upon vessels engaged in the coastwise trade of the United States." A formal protest against this exemption was made by Great Britain on the ground that it was a violation of the Hay-Pauncefote Treaty. In June 1914, under a special appeal from President Wilson, Congress passed a bill which repealed the Exemption Act of 1912. This was approved by President Wilson on June 15, 1914. Under authority given to him by the Panama Canal Act of Aug. 24, 1912, President Wilson issued a proclamation, on Nov. 21, 1913, fixing the canal tolls at $1.20 per net ton on laden ships and $.72 on vessels in ballast on the basis of tonnage as determined by the Panama canal rules of measurement. On Feb. 15, 1915, President Wilson issued supplementary instructions that where application of the $1.20 per-net-ton rate produced a sum in excess of the sum produced by the application of the $1.25 rate on net registered tonnage as determined by the United States rules of measurement, the excess amount should be uncollectable. The effect of this ruling was to reduce by approximately 14% the revenue from tolls paid by ships of all nationalities using the canal. Confusion and annoyances resulting from the dual system has caused the canal administration to advocate the adoption of the Panama Canal rules only as the basis of tolls and the rates to be set at $1 per net ton for laden ships and $.60 for ships in ballast.

Canal Traffic.—The number of commercial transits, the amount received from tolls and other collections, and the current expenses of maintenance and operation for the fiscal years ending June 30, 1915–28 are shown in the table in the next column.

Up to June 30, 1927, toll-paying traffic through the canal had aggregated 40,377 vessels, of 226,157,500 gross registered tons, 174,677,954 Panama Canal net tons; tolls paid amounted to $166,075,423.60; total transit revenue to $169,081,920.81; net canal transit expenses to $95,077,644.54; and net revenue (surplus) to $74,004,276.27. The transit revenues for the years 1915 and 1916 were considerably reduced by "slides" which closed the canal to traffic for a portion of each year. For the four years ending June 30, 1927, ships of 27 nationalities passed through the

Fiscal year	Number of commercial transits	Tolls and other transit revenues	Current expenses of operation and maintenance
1915	1,072	$4,343,383.69	$4,123,128.09
1916	760	2,558,542.38	6,909,750.15
1917	1,806	5,808,398.70	6,788,047.60
1918	2,068	6,411,843.28	5,920,342.94
1919	2,028	6,354,016.98	6,112,194.77
1920	2,478	8,935,871.57	6,548,272.43
1921	2,892	12,040,116.70	9,328,300.14
1922	2,736	11,385,592.32	7,919,017.63
1923	3,967	17,691,844.06	7,690,777.56
1924	5,230	24,681,853.89	8,373,905.39
1925	4,673	21,582,618.16	8,116,693.44
1926	5,197	23,145,136.53	7,993,468.47
1927	5,475	24,608,808.82	8,997,715.02
1928		27,176,045.68	8,951,200.82

Canal; American ships were slightly over 50% of the total, British slightly over 25%. About 39% of the cargo was in the United States inter-coastal trade. Of the 1927 traffic 8,583,327 cargo tons passed from the Atlantic to the Pacific and 19,164,888 cargo tons passed from the Pacific to the Atlantic.

Public vessels of the United States, Panama and Colombia and vessels which are sent through the canal solely for repair at the Balboa shops are exempt from the payment of tolls, and such vessels are omitted from the statistics in the above table. From the opening of the canal on Aug. 15, 1914 to June 30, 1927, they numbered 4,144, the majority of them being American naval vessels or army transports.

The following is the saving in nautical miles effected by the Panama canal in length of all-water routes between certain European and Atlantic-Gulf ports of the United States and various Pacific ports.

HISTORY

Early Interest in an Isthmian Canal.—When Columbus crossed the Atlantic, the object he had in view was to find a western passage from Europe to Cathay. It was with the greatest reluctance, and only after a generation of unremitting toil that the explorers who succeeded him became convinced that the American continent was continuous, and formed a barrier of enormous extent to the passage of vessels. The question of cutting a canal through this barrier at some suitable point was immediately raised. In 1550 the Portuguese navigator Antonio Galvao published a book to demonstrate that a canal could be cut at Tehuantepec, Nicaragua, Panama or Darien, and in 1551 the Spanish historian F. L. de Gomara submitted a memorial to Philip II. urging that the work be undertaken without delay. But the project was opposed by the Spanish Government, who had now concluded that a monopoly of communication with their possessions in the New World was of more importance than a passage by sea to Cathay. For more than two centuries no serious steps were taken towards the construction of the canal, if exception be made of William Paterson's disastrous Darien scheme in 1698. In 1771 the Spanish Government, having changed its policy ordered a survey for a canal at Tehuantepec, and finding that line impracticable, ordered surveys in 1779 at Nicaragua, but political

disturbances in Europe soon prevented further action. In 1808 the isthmus was examined by Alexander von Humboldt, who pointed out the lines which he considered worthy of study. After the Central American republics acquired their independence in 1823, there was a decided increase of interest in the canal question. In 1825 the Republic of the Centre, having received applications for concessions from citizens of Great Britain, and also from citizens of the United States, made overtures to the United States for aid in constructing a canal, but they resulted in nothing. Subsequently numerous concessions were granted to citizens of the United States, France and Belgium, both for the Nicaragua and the Panama lines, but with the exception of the concession of 1878 for Panama and that of 1887 for Nicaragua, no work of construction was done under any of them.

The United States Becomes Interested.—Knowledge of the topography of the isthmus was extremely vague until the great increase of travel due to the discovery of gold in California in 1848 rendered improved communications a necessity. A railroad at Panama and a canal at Nicaragua were both projected. Instrumental surveys for the former in 1849, and for the latter in 1850, were made by American engineers, and, with some small exceptions, were the first accurate surveys made up to that time. In order to determine the most practicable route for a ship canal across the American isthmus, the United States Government sent out, between 1870 and 1875, a series of expeditions under officers of the navy, by whom the various routes were examined. The result was to show that the only lines by which a tunnel could be avoided were the Panama and the Nicaragua lines; and in 1876 a United States Commission reported that the Nicaragua route possessed greater advantages and offered fewer difficulties than any other. At Nicaragua the distance is greater, being about 156 m. in a straight line, but more than one third is covered by Lake Nicaragua, a sheet of fresh water with an area of about 3,000 sq m. and a maximum depth of over 200 ft., the surface being about 105 ft. above sea-level. Lake Nicaragua is connected with the Atlantic by a navigable river, the San Juan, and is separated from the Pacific by the continental divide, which is about 160 ft. above sea-level. At Nicaragua only a canal with locks is feasible, but at Panama a sea-level canal is a physical possibility.

Treaties Effecting the Canal.—By the Clayton-Bulwer Treaty of 1850 with Great Britain, the United States guaranteed that the projected canal, whether the Panama cr the Nicaraguan, should be neutral, and, furthermore, that it be used and enjoyed upon equal terms by the citizens of both countries in each case. A modification of the Clayton-Bulwer Treaty being necessary to enable the United States to build the canal, a treaty making such modifications, but preserving the principle of neutrality, known as the Hay-Pauncefote Treaty, was negotiated with Great Britain in 1900; it was amended by the United States Senate, and the amendments not proving acceptable to Great Britain, the treaty lapsed in March 1901. A new treaty, however, was negotiated in the autumn, and accepted in December by the United States Senate. In the meantime (1876) an association entitled "Société Civile Internationale du Canal Interocéanique" was organized in Paris to make surveys and explorations for a ship canal. In May 1878 Lieut. Wyse, in the name of the association, obtained a concession from the Colombian Government, commonly known as the Wyse Concession. This is the concession under which work upon the Panama Canal was later prosecuted.

First Panama Company.—In May 1879 an International Congress composed of 135 delegates from various nations—some from Great Britain, United States and Germany, but the majority from France—was convened in Paris under the auspices of Ferdinand de Lesseps, to consider the best situation for, and the plan of, a canal. After a session of two weeks the Congress decided that the canal should be at the sea-level, and at Panama. Immediately after the adjournment of the Congress the Panama Canal Company was organized under a general law of France, with Lesseps as president, and it purchased the Wyse Concession at the price of 10,000,000 francs. An attempt to float this company in Aug. 1879 failed, but a second attempt, made in Dec. 1880, was fully successful. The next two years were devoted to surveys and examinations and preliminary work upon the canal. The plan adopted was for a sea-level canal having a depth of 29½ ft. and bottom width of 72 ft., involving excavation estimated at 157,000,000 cu.yd. The cost was estimated by Lesseps in 1880 at 658,000,000 francs, and the time required at eight years. The terminus on the Atlantic side was fixed by the anchorage at Colon, and that on the Pacific side by the anchorage at Panama.

Work under this plan continued until the latter part of 1887, the management being characterized by a degree of extravagance and corruption rarely if ever equalled in the history of the world. By that time it had become evident that the canal could not be completed at the sea-level with the resources of time and money then available. The plan was accordingly changed to one including locks, and work was pushed on with vigour until 1889, when the company, becoming bankrupt, was dissolved by a judgment of the Tribunal Civil de la Seine, dated Feb. 4, 1889, a liquidator being appointed by the court to take charge of its affairs. One of the more important duties assigned to this official was to keep the property together and the concession alive, with a view to the formation of a new company for the completion of the canal. He gradually reduced the number of men employed, and finally suspended the works on May 15, 1889

Second Panama Company.—The liquidator finally secured the organization of a new company on Oct. 20, 1894. The old company and the liquidator had raised by the sale of stock and bonds the sum of 1,271,682,637 francs. The securities issued to raise this money had a par value of 2,245,151,200 francs, held by about 200,000 persons. Immediately after its organization the new company took possession of the property (except the Panama railroad shares, which were held in trust for its benefit), and proceeded to make a new study of the entire subject of the canal in its engineering and commercial aspects. It resumed the work of excavation, with a moderate number of men sufficient to comply with the terms of the concession, in a part of the line—the Emperador and Culebra cuts—where such excavation must contribute to the enterprise if completed under any plan. By the middle of 1895, about 2,000 men had been collected, and after that time the work progressed continuously, the number of workmen varying between 1,900 and 3,600. The engineering questions had been solved to the satisfaction of the company, but the financial questions, by 1899, had been made extremely difficult, if not insoluble, by the appearance of the United States Government in the field as a probable builder of an isthmian canal. The company continued to conduct its operations in a provisional way, without appealing to the public for capital.

Nicaragua Scheme.—The occupation of the Panama route by Europeans, and the prospect of a canal there under foreign control, was not a pleasing spectacle to the people of the United States. The favour with which the Nicaragua route had been considered since 1876 began to assume a partisan character, and the movement to construct a canal on that line to assume a practical shape. In 1884 a treaty, known as the Frelinghuysen-Zarala Treaty, was negotiated with Nicaragua, by the terms of which the United States Government was to build the canal without cost to Nicaragua, and after completion it was to be owned and managed jointly by the two Governments. The treaty was submitted to the United States Senate, and in the vote for ratification, on Jan. 29, 1885, failed to receive the necessary two-thirds vote This failure led to the formation in New York by private citizens in 1886 of the Nicaragua Canal Association, for the purpose of obtaining the necessary concessions, making surveys, laying out the route, and organizing such corporations as should be required to construct the canal. They obtained a concession from Nicaragua in April 1887, and one from Costa Rica in Aug. 1888, and sent parties to survey the canal. On Feb. 20, 1889 the Maritime Canal Company of Nicaragua was incorporated by Congress, and on May 4, 1889 the company was organized. It took over the concessions and began work upon the canal in June 1889. Operations upon a moderate scale and mainly of a preliminary character were continued until 1893, when the financial disturbances of that period drove the construction company into bankruptcy and compelled a suspension of the work.

Congress continued to take an interest in the enterprise, and in 1895 provided for a board of engineers to inquire into the possibility, permanence, and cost of the canal as projected by the Maritime Canal Company. The report of this board led to the appointment in 1897 of another board, to make additional surveys and examinations. Its report was not completed when the revival of the Panama scheme attracted the attention of Congress, and led to the creation in 1899 of the Isthmian Canal Commission.

Isthmian Canal Commission.—The Spanish-American War of 1898 gave a tremendous impetus to popular interest in an isthmian canal, and it seemed an article of the national faith that the canal must be built, and, furthermore, that it must be under American control. To the American people the canal appeared a means of unifying and strengthening their national political interests, and of developing their industries, particularly in the Pacific States; in short, a means essential to their national growth. The Isthmian Canal Commission created by Congress in 1899 to examine all practicable routes, and to report which was the most practicable and most feasible for a canal under the control, management and ownership of the United States, reported that there was no route which did not present greater disadvantages than those of Panama and Nicaragua. The cost of a canal at Panama, built essentially upon the French plans, was estimated at $156,378,258. The time required to build the Nicaraguan canal was estimated at ten years and its cost at $200,540,000.

The report of the commission recommended the Nicaragua route. This caused the New Panama Canal Company, which was having serious financial difficulties, to view the question of selling its property in a new light and in the spring of 1901 it obtained permission from the Colombian Government to dispose of it to the United States. It showed itself, however, somewhat reluctant to name a price to the Canal Commission, and it was not till Jan. 1902 that it definitely offered to accept $40,000,000. In consequence of this offer, the commission in a supplementary report issued on Jan. 18, 1902 reversed the conclusion it had stated in its main report, and advised the adoption of the Panama route, with purchase of the works, etc., of the French company. The Hepburn bill, then before Congress, authorizing the Nicaragua canal at a cost of $180,000,000, was amended so that the president was authorized to acquire all the property of the Panama Canal Company, including not less than 68,869 shares of the Panama Railroad Company, for a sum not exceeding $40,000,000, and to obtain from Colombia perpetual control of a strip of land 6 m. wide; while if he failed to come to terms with the company and with Colombia in a reasonable time and on reasonable terms, he was by treaty to obtain from Costa Rica and Nicaragua the territory necessary for the Nicaragua canal.

Declaration of Panama Independence.—Negotiations were forthwith opened with Colombia, and ultimately a treaty (the Hay-Herran treaty) was signed in Jan. 1903. The Colombian Senate, however, refused ratification, and it seemed as if the Panama scheme would have to be abandoned when the complexion of affairs was changed by Panama revolting from Colombia and declaring itself independent in Nov. 1903. Within a month the new republic, by the Hay-Bunau-Varilla Treaty, granted the United States the use, occupation and control of a strip of land 10 m. wide for the purposes of the canal. A few days after the ratification of this treaty by the United States Senate in Feb. 1904—the concession of the French company having been purchased—a commission was appointed to undertake the organization and management of the enterprise, and in June Mr. J. F. Wallace was chosen chief engineer. Work was begun without delay, but the commission's methods of administration and control soon proved unsatisfactory, and in April 1905 it was reorganized, three of its members being constituted an executive committee which was to be at Panama continuously. Shortly afterwards Wallace resigned his position and was succeeded by John F. Stevens.

Construction Problems.—In connection with the reorganization of the commission a board of consulting engineers, five being nominated by European Governments, was appointed in June 1905 to consider the question, which so far had not been settled, whether the canal should be made at sea-level, without locks (at least except tidal regulating locks at or near the Pacific terminus), or should rise to some elevation above sea-level, with locks. The majority of the board declared in favour of a sea-level canal as the only plan "giving reasonable assurance of safe and uninterrupted navigation"; while the minority recommended a lock canal, rising to an elevation of 85 ft. above mean sea-level, on the grounds that it would cost about $100,000,000 less than the proposed sea-level canal, that it could be built in much less time, that it would afford a better navigation, that it would be adequate for all its uses for a longer time, and that it could be enlarged if need should arise with greater facility and less cost. These conflicting reports were then submitted to the Isthmian Canal Commission for consideration, with the result that on Feb. 5, it reported, one member only dissenting, in favour of the lock canal recommended by the minority of the board of consulting engineers. Finally this plan was adopted by Congress in June 1906.

Tenders of private contractors proving unsatisfactory President Roosevelt decided that it would be best for the Government to continue the work, which was placed under the more immediate control of the U.S.A. Corps of Engineers. At the same time the Isthmian Canal Commission was reorganized, Col. G. W. Goethals, of the Corps of Engineers, becoming engineer in chief and chairman on the resignation of J. F. Stevens (April 1, 1907). This commission was composed of four army engineers, an army doctor, one navy engineer and one civilian. President Roosevelt, who was convinced that the best results could not be obtained through an executive body of seven members, issued an executive order in January 1908 placing supreme power in the hands of Col. Goethals, abolishing the commission as an executive body, and making its members, who were heads of departments, subordinate to him, giving Col. Goethals all civil, military and other powers in the canal zone, and this course was subsequently approved in the act of 1912 for the government and operation of the canal after its completion.

The construction period of the Panama canal covered about 10 years, but the actual work of construction was accomplished in about seven years; the first three years were devoted to preliminary preparation, during which time the thorough sanitation of the Canal Zone was accomplished, yellow fever banished, an operating plant assembled, the railways modernized, a working force gathered, living quarters erected and a food and water supply provided. The plans for the canal itself had yet to be worked out in detail when the third commission took charge. Important changes in the general plan of the canal made it necessary to evolve an entirely new set of plans for lock and dam construction on the Pacific side and also for basal dimensions of the channel. The original plans provided for a total excavation of 95,000,000 cu.yd. and a total cost of $190,000,000 exclusive of $40,000,000 paid to the French Canal company, $10,000,000 paid to the Panama republic, and the cost of sanitation and civil administration. Changes made in 1908–09 increased the total excavation to 175,000,000 cu.yd. and the estimated cost to $375,210,000 inclusive of payments to the French Canal Company and the Republic of Panama. When the lock canal plan was adopted in 1906, it was estimated that nine years would be required for its completion, placing the date at Jan. 1, 1915. This date was accepted and the work was adjusted and prosecuted to this end. During the first five years under the Third Commission 75% of the entire excavation of the canal was accomplished. In spite of the fact that "slides" added more than 25% of the total excavations from Culebra cut, and were not taken into account in the estimated time or cost, the work was advanced to such a stage that the first ocean steamer was passed through on Aug. 3, 1914, and but for an unexpected slide which occurred on Oct. 14 of that year would have been completed in its entirety within the estimated time and below the estimated cost. When the canal was declared formally complete and open, a total of about 240,000,000 cu.yd. had been excavated and the total cost, exclusive of expenditures for naval and military defence, was only $366,650,000, of which $10,000,000 was for "slides" or breaks in the walls of the cut of which there were about 30 at different times.

PAN-AMERICAN CONFERENCES. The six International Conferences of the American States, with various scientific, financial, commercial, legal and journalistic conferences held in the past 100 years are generally classified under this head, as being part of the movement toward co-operation amongst the 21 republics of the Western Hemisphere These conferences include representatives of all the national areas of the hemisphere, excepting Canada and the British, French and Dutch colonies

The original Pan-American Congress was called by Simon Bolivar (*q.v.*), and met in Panama in 1826, with representatives of Great Colombia, Guatemala, Mexico and Peru in attendance Representatives of the United States were named, but did not arrive until the Congress had adjourned A treaty of "union, league, and perpetual confederation" was signed, June 22, 1826, but Mexico, Peru and Guatemala failed to ratify it The postponed sessions of the Panama conference, which was to reconvene at Tacubaya, near Mexico City, were never held

In 1856, representatives of Peru, Chile and Ecuador met in Santiago, Chile, and signed the "Continental Treaty," which was designed to promote the union of the Latin American republics, but also expressed hostility toward the United States, on account of the recent activities of William Walker (*q v*), the filibuster, in Nicaragua; the treaty never became effective In 1864, another conference, called at the invitation of Peru, met in Lima, for the avowed object of forming a union of the Latin American States This conference was attended by representatives of Guatemala, Venezuela, Colombia, Ecuador, Peru, Bolivia and Argentina

In 1877 and 1878, jurists from Peru, Bolivia, Chile, Ecuador, Cuba, Honduras, Argentina, Venezuela and Costa Rica met at Lima and drew up treaties of extradition and made the first steps toward agreement on private international law (conflict of laws) Uruguay and Guatemala agreed to adhere to these treaties Progress was being made slowly, and in 1881 Colombia called a conference to be held in Panama, but owing to the War of the Pacific, between Peru and Bolivia, and Chile, this was not held

In 1882, invitations were issued by the U S Government, James G Blaine being secretary of State, for a conference to be held in Washington in November of that year, to discuss arbitration between the nations of the American hemisphere The assassination of President James A Garfield, and the accession of President Chester A Arthur, caused the withdrawal of the invitations, which were not reissued until 1889 Meanwhile, in 1888–89, jurists from Argentina, Bolivia, Brazil, Chile, Paraguay, Peru and Uruguay met at Montevideo and concluded treaties on international law, civil, commercial and penal, on international law of procedure, copyrights, trade-marks and patents, several of which were ratified by the signatory powers

In May 1888, the United States invited the Latin American countries to join with it in a conference in Washington "to consider measures for preserving the peace," the formation of a customs union, better communications, a common silver coin, a uniform system of weights and measures, patent rights, copyrights, trade-marks, sanitary regulation of ships and ports, etc President Benjamin Harrison had recalled Blaine to be his secretary of State and this was one of his first acts All the countries except Santo Domingo accepted the invitation. This conference, later to be known as the First Pan-American Conference, met on Oct 2, 1889, with Blaine presiding, and continued its sessions to April 19, 1890. The conference voted for compulsory arbitration, and recommendations were made regarding reciprocity in trade, customs regulations, port duties, sanitary regulations, free navigation of rivers, a monetary union, common weights and measures, patents and trade marks, extradition of criminals, an intercontinental railway (first voiced at this conference by Blaine), and other matters Failure to ratify or no action at all by the Governments nullified virtually all the work done, but from this conference came the establishment of the International Bureau of American Republics, later to become the present Pan-American Union (*q.v.*).

The Second Conference.—The Second Pan-American Conference, or properly the Second International Conference of the American States, was called, at the suggestion of President William McKinley of the United States, to meet in the City of Mexico, and convened Oct 22, 1901 Every country was represented and the sessions continued until Jan 31, 1902 The chief issue was arbitration, and the session was divided between those who favoured compulsory and those who felt that voluntary arbitration was the only practical step at the time; the final decision was a recommendation that all the countries adhere to the Hague Conventions of 1899, which provided for voluntary arbitration Ten delegations, however, signed a pact for compulsory arbitration This conference also took up the moot question of pecuniary claims of individuals against the Governments of countries not their own, and the conference adopted a resolution recommending that such claims be submitted to the arbitration court set up under The Hague Convention The conference recommended the construction of railways that would fit into the proposed route of the Pan-American railway At the Mexico Conference the International Bureau of American Republics was placed under the control of a governing board composed of the Latin American diplomatic chiefs of mission resident in Washington, with the secretary of State of the United States as ex-officio chairman. The Bureau was instructed to publish a bulletin monthly, and was made a repository of documents and given other more important functions. The governing board was instructed to take in hand the arrangements for the Third Pan-American Conference

The Third Conference.—The Third Pan-American Conference was held in Rio de Janeiro, Brazil, from July 21 to Aug 26, 1906, and was attended by representatives of all the 21 republics with the exception of Haiti and Venezuela Elihu Root, the American secretary of State, went to Rio for the conference, and sounded its keynote in an address which is still regarded as the essence of the Pan-American idea The subjects taken up at this conference followed the same line as the two previous ones. The arbitration issue was transferred to The Hague, by a resolution urging that the American delegates to The Hague seek the celebration of a general arbitration convention "so effective and definite that, meriting the approval of the civilized world, it shall be accepted and put in force by every nation" The resolutions passed at Mexico City with regard to patents, copyrights and trade-marks were reaffirmed with some modifications, and naturalization and return to nationality of birth were made easier. With respect to the forcible collection of public debts, to which the "Drago Doctrine" is opposed, the conference recommended that "the Governments represented therein consider the point of inviting the Second Peace Conference at The Hague to consider the question of the compulsory collection of public debts, and, in general, means tending to diminish between nations conflicts having an exclusively pecuniary origin" The first Pan-American Scientific Congress met at Santiago, Chile, on Dec 25, 1908, for the consideration of distinctly American problems. It continued in session until Jan 5, 1909, and resolved that a second congress for the same purpose should meet at Washington in 1912

The Fourth Conference.—The Fourth Pan-American Conference was held at Buenos Aires from July to August 1910. It agreed to submit to arbitration such money claims as cannot be amicably settled by diplomacy, and changed the name of the organization to the Bureau of Pan-American Union During the same year the Pan-American Union building, erected through a gift of $750,000 from Andrew Carnegie and $250,000 contributed by the various republics of the Union, was formally dedicated. The second Pan-American Scientific Congress met in Washington during the three weeks following Dec. 25, 1915. Among the speakers was President Wilson, who urged friendly settlement of

international disputes by arbitration. The congress appointed an International High Commission, which sat at Buenos Aires in April 1916. Improvement and extension of cable, telegraph and railway services between the countries was urged. A permanent International High Commission was established to promote uniform commercial laws throughout the countries represented in the Union. In Feb. 1918, the governing board of the Pan-American Union approved a plan to establish a Section of Education to promote better knowledge of the languages and history of the American republics through educational institutions.

In Nov. 1918, a Pan-American Federation of Labour Conference met at Laredo, Texas. Delegates were present from the United States, Mexico and Central America. An influenza epidemic interfered with South American attendance, Colombia alone being represented. A permanent federation was organized. Pan-American Child Welfare Congresses met at Montevideo, Uruguay, in Dec. 1918, and in May 1919; at the second meeting provision was made for establishing at Montevideo an International Bureau of Child Welfare. In June 1919, the second Pan-American Commercial Congress was held in Washington, and in the same city, in Jan. 1920, a Pan-American Financial Congress. The sixth International Sanitary Conference was held in Montevideo, Dec. 12 to 20, 1920. It re-organized the International Sanitary Bureau, which has been active in disseminating valuable bulletins on sanitation and public health.

The Fifth Conference.—The Fifth Pan-American Conference was held March 25 to May 3, 1923, at Santiago, Chile, Henry P. Fletcher, U.S. ambassador to Belgium, being head of the U.S. delegation. Delegations from all the American republics, except Bolivia, Mexico and Peru, were present, and a large number of subjects were discussed. A proposal by Uruguay that the principle of the Monroe Doctrine be adopted by all American States was not supported by the United States delegates, and was recommended for report to the next Pan-American Conference. Similarly, an attempt to arrive at an agreement for the limitation of naval armaments failed on account of disagreement between Brazil, Argentina and Chile. Costa Rica strongly urged the establishment of an American Permanent Court of Justice but failed to obtain the support of the conference, because the plan submitted included arbitration of questions involving the vital interests of nations, and the matter was referred to the commission of jurists at Rio de Janeiro in 1925.

Four conventions were completed and signed, viz., an agreement under which international disputes might be investigated and settled by a commission empowered to ascertain facts; a trade-mark convention, protecting users of trade-marks in the countries where ownership of the mark is acquired through registration; a convention to secure uniformity of nomenclature in the classification of merchandise; and one providing for the publicity of customs documents. No fewer than 73 resolutions were passed, one of the most important of which created four permanent committees to assist the Union in the study of (1) the best means of developing the economic and commercial relations between the American States; (2) the international organization of labour in America; (3) hygiene in the countries of the American continent; and (4) the best means of developing intellectual co-operation, with especial reference to co-operation between the universities and the exchange of professors and students.

The Sixth Conference.—The Sixth Pan-American Conference was held in Havana, Cuba, from Jan. 16 to Feb. 20, 1928. This was attended by President Coolidge of the United States, and delegations from all the other countries were present. Charles Evans Hughes, former American secretary of State, headed the delegation of the United States. A few months prior to this conference, the jurists of the American nations had met in Rio de Janeiro and approved drafts for the codification of Public International Law and Private International Law, and the discussion of these ambitious projects occupied much of the attention of the conference. The Pan-American Union was placed on a treaty basis, although pending the signature of the treaty by the American powers. The usual resolution, under which it had existed from conference to conference, was also passed. It was provided that the nation members of the Union might designate special members of the governing board, who might or might not, as they deemed fit, be the same individuals as their diplomatic representatives in Washington. The conference authorized 14 conferences of various sorts, to be handled or arranged for by the Pan-American Union. The most important of these was that on arbitration, which was held in Washington beginning Dec. 10, 1928. A Pan-American convention on aerial navigation was adopted, with provisions that other nations might adhere if they so desired. The Seventh Conference was tentatively set for Montevideo, Uruguay, in 1933.

The Washington conference on arbitration, Dec. 10, 1928, to Jan. 5, 1929, adopted conventions for conciliation and arbitration. The former provided for commissions of inquiry with authority to suggest bases of settlement for international disputes. The arbitration treaty provided for compulsory arbitration of all juridical questions, only two exceptions being cited, *i.e.*, domestic questions not controlled by international law, and matters in which third parties were concerned. Neither national honour nor the Monroe Doctrine was excepted. The treaties were signed by the United States and 19 other countries, 13 with reservations.

OF DOCUMENTS. (W. THO.)

PAN-AMERICAN UNION. At the first international Conference of American States held at Washington, a recommendation was approved on March 29, 1890, for the establishment of an inter-American organization to be known as "the International Union of American republics" for the prompt collection and distribution of commercial data and information. This Union was to be represented at Washington, D.C. by a bureau called "the commercial bureau of the American republics," its organ of publicity to be a publication in English, Spanish, Portuguese and French—the four languages spoken in Latin America and the United States—entitled *The Bulletin of the Commercial Bureau of the American Republics*. It was also provided that this bureau was to be "at all times available as a medium of communication and correspondence for persons applying for information in regard to matters pertaining to the commerce of the American republics." To defray the expenses of maintaining the bureau the sum of $36,000 was set aside to be advanced by the U.S. Government, which was to be reimbursed by the other republics by their respective quotas in proportion to their population. Subsequently the Dominican republic joined the Union, as did later Cuba and Panama. The report of the committee adopted by the first conference is the original charter of the bureau.

At the second conference a resolution was adopted on Jan. 29, 1902, for the reorganization of the bureau. In Art. I. of this resolution it is provided that the international bureau of the American republics shall be under the management of a governing board, which shall consist of the secretary of State of the United States of America, who shall be its chairman, and of the diplomatic representatives of all the Governments represented in the bureau and accredited to the U.S. Government. The resolution contained 13 articles and provided in detail for the management of the bureau, and conferred upon the governing board full power over its affairs. The name of the bureau was changed from "the commercial bureau of the American republics" to "the international bureau of the American republics." The third international conference, which met at Río de Janeiro, adopted on Aug. 19, 1906, a resolution, signed by all of the delegates, for the reorganization of the bureau. This resolution did not change in any particular the essentials of the resolution of Mexico City so far as the administration of the bureau, its character as an international

institution, and the work to be performed by it were concerned. It did change many of the details of administration within the bureau and imposed upon it additional work.

The action of the fourth international conference, which met at Buenos Aires in 1910, further enlarged the scope of the organization and changed the name to that of "Pan-American Union," while the name of the organization of American countries which support the Pan-American Union was changed to "Union of American republics" instead of "International Union of the American republics"; the chief executive officer of the Union was made director general and the secretary was made assistant director and secretary of the governing board. The principal change made at the fifth conference, held in Santiago, Chile, in 1923, was in the organization of the governing board. It was provided that the offices of chairman and vice chairman should be elective; and also that if for any reason an American republic should not have a diplomatic representative accredited to the U.S. Government that Government might appoint a special representative on the governing board.

At the sixth conference, held at Havana, Cuba, in Jan. 1928, a convention was signed, providing for the organization of the Pan-American Union; this convention, however, continues the present organization with very slight changes. The only important modification is that the Governments' representatives may either send special representatives to the governing board or designate their diplomatic representatives at Washington.

Purpose and Activities.—The Pan-American Union is housed in a building, the gift of Andrew Carnegie. The basic purpose of the Pan-American Union is to develop closer intellectual and commercial relations between the republics of the American continent and to promote international co-operation in every possible way. The Union is supported by quotas paid by the republics of America in proportion to population. It publishes a monthly bulletin in English and other languages which contains a record of Pan-American progress and practical information on Pan-American affairs. The Union also publishes a series of pamphlets on each of the republics of the American continent and also special pamphlets on the capital cities, the leading products and the commercial relations of these countries. Recently four special series were established, dealing with agriculture, commerce and finance, education and hygiene and child welfare. The Union has a library, known as the Columbus Memorial library, containing more than 70,000 vol., and also a large collection of maps, photographs, lantern slides and negatives. One of the most important functions of the Pan-American Union is to prepare the agenda for the Pan-American Conferences, which meet at intervals of five years. (L. S. Ro.)

PANATHENAEA, an annual festival at Athens of great antiquity and importance. Traditionally begun by Erechtheus and changed from Athenaea (festival of Athena) to Panathenaea (festival of all Athenians, universal festival of Athena) by Theseus, its elaboration seems to date from Peisistratus. In its developed form it was celebrated every fourth year with especial splendour, probably in deliberate rivalry to the Olympic games; its date was the third year of each Olympiad. The annual festival, probably about the middle of August, consisted solely of the sacrifices and rites proper to this season in the cult of Athena. One of these rites originally consisted in carrying a new *peplos* through the streets to the Acropolis, to clothe the ancient carved image of the goddess; but it is probable that this rite was afterwards restricted to the great penteteric festival. The *peplos* was a costly, saffron-coloured garment, embroidered with scenes from the battle between the gods and giants. At least as early as the 3rd century B.C. the custom was introduced of spreading the *peplos* like a sail on the mast of a ship, which was rolled on a machine in the procession. At the Great (quadrennial) Panathenaea representatives of all the dependencies of Athens were present, bringing victims, and a most brilliant procession resulted. After the presentation of the *peplos* the hecatomb was sacrificed. The subject of the frieze of the Parthenon is this great procession.

Pericles introduced a regular musical contest in place of the recitations of rhapsodes, which were an old-standing accompaniment of the festival. This contest took place in the Odeum, originally built for this purpose by Pericles himself. The order of the *agones* from this time onwards was—first the musical, then the gymnastic, then the equestrian contest. Many kinds of contest, such as the chariot race of the *apobatai* (said to have been introduced by Erechtheus), which were not in use at Olympia, were practised in Athens. *Apobates* was the name given to the companion of the charioteer, who showed his skill by leaping out of the chariot and up again while the horses were going at full speed. There were in addition several minor contests: the *Pyrrhic,* or war dance; the *Euandria,* or parade of "crack" troops; the *Lampadedromia,* or torch-race; the *Naumachia* (regatta), which took place on the last day of the festival. The proceedings were under the superintendence of ten *athlothetai,* one from each tribe, the lesser Panathenaea being managed by *hieropoioi.* In the musical contests, a golden crown was given as first prize; in the sports, a garland of leaves from the sacred olive trees of Athena and vases filled with oil from the same. The season of the festival was the 24th to the 29th of Hecatombaeon, and the great day was the 28th.

See A. Michaelis, *Der Parthenon* (1871, bibl.); L. R. Farnell, *Cults of Greek States,* i. (1896); A. Mommsen, *Feste d. Stadt Athen* (1898); *cf.* ATHENA.

PANCH MAHALS, a district of British India, in the northern division of Bombay. Area, 1,606 sq.m. Pop. (1921) 374,860. The administrative headquarters are at Godhra. The tract, which includes Champaner, the old Hindu capital of Gujarat, now a ruin, became British territory as recently as 1861, by a transfer from Sindhia. There are rich mineral deposits, and manganese is mined on a large scale. The district is crossed by the branch of the Bombay and Baroda railway from Anand, through Godhra to Ratlam; and a line runs from Godhra to Baroda city.

PANCREAS or SWEETBREAD, in anatomy, the pink tongue-shaped, digestive gland which lies across the posterior wall of the abdomen about the level of the first lumbar vertebra behind, and the transpyloric plane in front (*see* ANATOMY: *Superficial and Artistic*). Its right end is a little to the right of the mid line of the abdomen and is curved round the superior mesenteric vessels, into the form of a ⊂. This hook-like right end (the head) is adapted to the concavity of the duodenum. The first inch of the straight limb forms the neck and lies in front of the beginning of the portal vein, below the pyloric opening of the stomach and above the superior mesenteric vessels. The next three or four inches of the pancreas, form the body and this part lies in front of the left kidney and adrenal body, while it helps to form the posterior wall of the "stomach chamber" (*see* ALIMENTARY CANAL). At its left extremity the body tapers to form the tail, which usually touches the spleen (*see* DUCTLESS GLANDS) just below the hilum.

The pancreas is altogether behind the peritoneum. There is one main duct (the duct of Wirsung) which runs the whole length of the organ nearer the back than the front. As it reaches the head it turns downward and opens into the second part of the duodenum, joining the common bile duct while they are both piercing the walls of the gut. A smaller accessory pancreatic duct communicates with the main duct.

The pancreas has no capsule, but is divided up into lobules held together by their ducts and by loose areolar tissue; the glands of which these lobules are made up are acino-tubular (*see* GLANDS). Small groups of epithelium-like cells without ducts (Islets of Langerhans) occur among the glandular tissue and are characteristic of the pancreas. They are the source of insulin (*q.v.*) and degenerate in most cases of diabetes mellitus (*q v.*).

Embryology.—The pancreas is developed, by three diverticula, from that part of the foregut which will later form the duodenum. Of these diverticula the left ventral disappears early, but the right ventral, which is really an outgrowth from the lower part of the common bile duct, forms the head of the pancreas. The body and tail are formed from the dorsal diverticulum, and the two parts, at first separate, join one another so that the ducts communicate, and eventually the ventral one takes almost all the secretion

of the gland to the intestine, while that part of the dorsal one which is nearest the duodenum atrophies and forms the duct of Santorini. The main pancreatic duct (of Wirsung) is therefore formed partly by the ventral and partly by the dorsal diverticulum. As the diverticula grow they give off lateral branches, which branch again and again until the terminal buds form the acini of the gland. At first the pancreas grows upward, behind the stomach, between the two layers of the dorsal mesogastrium (*see* COELOM AND SEROUS MEMBRANES), but when the stomach and duodenum turn over to the right, the gland becomes horizontal and the opening of the right ventral diverticulum becomes more dorsal. Later, by the unequal growth of the duodenal walls, it comes to enter the gut on its left side where the papilla is permanently situated. After the turning over of the pancreas to the right the peritoneum is absorbed from its dorsal aspect. The islets of Langerhans are now regarded as portions of the glandular epithelium which have been isolated by the invasion and growth round them of mesenchyme (*see* Quain's *Anatomy,* vol. i., 1908).

Comparative Anatomy.—In the Acrania (Amphioxus) no representative of a pancreas has been found, but in the Cyclostomata (hags and lampreys) there is a small lobular gland opening into the bile duct which probably represents it. In the Elasmobranchs (sharks and rays) there is a definite compact pancreas of considerable size. In the Teleostomi, which include the true bony fish (Teleostei), the sturgeon and Polyterus, the pancreas is sometimes a compact gland and sometimes diffuse between the layers of the mesentery; at other times it is so surrounded by the liver as to be difficult to find. Among the Dipnoi (mud fish), Protopterus has it embedded in the walls of the stomach and intestine. The Amphibia have a definite compact pancreas, which lies in the U-shaped loop between the stomach and duodenum, and is massed round the bile duct. In the Reptilia there are sometimes several ducts, as in the crocodile and the water tortoise (Emys), and this arrangement is also found in birds. In mammals the gland is usually compact, though sometimes (rabbit) it is diffuse. It usually has two ducts, as in man, though in many animals (ox, sheep and goat) only one persists. When there is only one duct it may open with the common bile duct, *e.g.,* sheep and cat, or may be very far away as in the ox and rabbit. (F. G. P.)

PANCREAS, DISEASES OF THE. In sclerosis, atrophy, acute and chronic inflammatory changes and new growths in the pancreas an absence or lessening of pancreatic secretion may be evident. *Haemorrhage into the pancreas* is of some medico-legal importance as being a cause of death. *Acute haemorrhagic pancreatitis* is a combination of inflammation with haemorrhage in which the pancreas is enlarged and infiltrated with blood. Violent pain, vomiting and collapse, are the chief features as is also the case in *pancreatic abscess* in which the abscess may be single or multiple. In the latter condition operation has been followed by recovery. Haemorrhagic inflammation has been followed by *gangrene of the pancreas,* which usually terminates fatally. In two remarkable cases, however, reported by Chiari recovery followed on the discharge per rectum of the necrosed pancreas. *Chronic pancreatitis* has been said by Mayo Robson to occur in connection with the symptoms of catarrhal jaundice, which he suggested is due to the pressure on the common duct by the swollen pancreatic tissue. The organ is enlarged and very hard, and the symptoms are pain, dyspepsia, jaundice, loss of weight and the presence of fat in the stools. This latter sign is common to all forms of pancreatic disease. In connection with many pancreatic diseases small yellowish patches are found in the pancreatic tissue, mesentery, omentum and abdominal fatty tissue generally, and the tissues appear to be studded with whitish areas often not larger than a pin's head. The condition, which was first observed by Balser, has been termed "fat-necrosis," and is due to the action on the fat of lipolytic ferment set free by disorganization of the pancreas. The pancreas like other organs, is subject to the occurrence of new growths, tumours and cysts, syphilis and tuberculosis. Of these carcinoma of the head of the organ is the most common. Diabetes (*q.v.*) is the subject of a special article.

PANDA (*Aelurus fulgens*), a mammal of the family *Procyonidae* (*see* CARNIVORA). This animal, rather larger than a cat, ranges from the Eastern Himalaya to North-west China. It is found among rocks and trees and feeds on fruits and other vegetable substances. Its fur is rich reddish-brown, darker below; the face is white, save for a vertical stripe of red from just above the eye to the gape; there are several pale rings on the tail.

PANDARUS, in Greek legend, son of Lycaon, a Lycian. In the *Iliad* he breaks the truce between the Trojans and the Greeks by treacherously wounding Menelaus with an arrow, and finally he is slain by Diomedes. In the mediaeval tale of Troilus and Cressida he was the latter's uncle and acted as the lovers' go-between; hence the modern "pander."

PANDEAN PIPE: *see* SYRINX.

PANDECTS, a name given to a compendium or digest of Roman law compiled by order of the emperor Justinian in the 6th century A.D. (530–533). (*See* JUSTINIAN; and ROMAN LAW.)

PANDERMA (Gr. *Panormus*), a district in the vilayet of Karassi in Asia Minor, on the south shore of the Sea of Marmora, near the site of Cyzicus. It has a trade in cereals, cotton, opium, valonia and boracite and is connected by railway with Smyrna. Pop. (1927) 61,918.

PANDHARPUR, a town of British India, in Sholapur district of Bombay, on the right bank of the river Bhima, 38 m. W. of Sholapur town. Pop. (1921), 25,210. Pandharpur is the most popular place of pilgrimage in the Deccan; its celebrated temple, dedicated to Vithoba, a form of Vishnu, is visited by large numbers, particularly in July. It is connected by a light railway with Barsi Road on the Great Indian Peninsula railway.

PANDORA, according to Hesiod (*Theog.* 570–612, *Works and Days* 59 et seq.), the first woman (Gr., the "All-giving"). After Prometheus had stolen fire from heaven and bestowed it upon mortals, Zeus determined to counteract this blessing. He accordingly commissioned Hephaestus to fashion a woman out of earth, upon whom the gods bestowed their choicest gifts. Hephaestus gave her a human voice; Aphrodite, beauty and powers of seduction; Hermes, cunning and the art of flattery. Zeus gave her a jar (πίθος), the so-called "Pandora's box" (*see* below), containing all kinds of misery and evil, and sent her, thus equipped, to Epimetheus, who, forgetting the warning of his brother Prometheus to accept no present from Zeus, made her his wife. Pandora afterwards opened the jar, from which all manner of evils flew out over the earth (for parallels in other countries, *see* Frazer's *Pausanias* ii. 320). Hope alone remained at the bottom, the lid having been shut down before she escaped (Hesiod, *Works and Days* 54–105). But in a later story, the jar contained, not evils, but blessings, which would have been preserved for the human race had they not been lost through the opening of the jar out of curiosity by man himself (Babrius, *Fab.* 58).

See J. E. Harrison, "Pandora's Box," in *Journal of Hellenic Studies* xx. (1900); O. Gruppe, *Griechische Mythologie* i. 94 (1906); Preller-Robert I. 97.

PANDROSEUM, a temenos or sacred area, on the north side of the Athenian acropolis, dedicated to Pandrosos, the daughter of Cecrops, legendary first king of Athens. Its position and shape determine the plan of the west side of the erechtheum (*q.v.*).

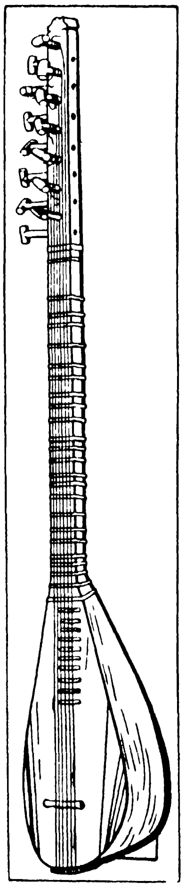
PANDUA, a ruined city in Malda district of Bengal, once a Mohammedan capital. It is situated 9 m. N.E. of Old Malda, and about 20 m. from the other great ruined city of Gaur (*q.v.*). About A.D. 1340, Shamsuddin Ilyas Shah, one of the early kings of Bengal, transferred his capital from Gaur to Pandua; but the time of its prosperity was short, for in A.D. 1455 the capital was transferred back to Gaur. Its most celebrated building is the Adina mosque built by Sikandar Shah (1357–90), which was described by James Fergusson as the finest example of Pathan architecture in existence. Other notable buildings are the Ekhlakhi mosque or tomb and the Sona or golden mosque which with the Adina mosque are conserved by Government.

PANDULPH [PANDOLFO] (d. 1226), Roman ecclesiastical politician, papal legate to England and bishop of Norwich, was born in Rome, and first came to England in 1211, when he was commissioned by Innocent III. to negotiate with King John. He is said to have produced the papal sentence of excommunication in the very presence of the king. In May 1213 he again visited

England to receive the king's submission. The ceremony took place at Dover, and on the following day John, of his own motion, formally surrendered England to the representative of Rome to receive it again as a papal fief. Pandulph repaid this act of humility by using every means to avert the threatened French invasion of England. For nearly a year he was superseded by the cardinal-legate Nicholas of Tusculum; but returning in 1215 was present at the conference of Runnymede, when the great charter was signed. He rendered valuable aid to John who rewarded him with the see of Norwich. The arrival of the cardinal-legate Gualo (1216) relegated Pandulph to a secondary position; but after Gualo's departure (1218) he came forward once more. As representing the pope he claimed a control over Hubert de Burgh and the other ministers of the young Henry III ; and his correspondence shows that he interfered in every department of the administration. His arrogance was tolerated while the regency was still in need of papal assistance; but in 1221 Hubert de Burgh and the primate Stephen Langton successfully moved the pope to recall Pandulph and to send no other legate *a latere* in his place Pandulph retained the see of Norwich, but from this time drops out of English politics He died in Rome on Sept. 16, 1226 but his body was taken to Norwich for burial.

See W. Shirley, *Royal and Other Historical Letters* ("Rolls series") vol. i ; Miss K Norgate, *John Lackland* (1902) ; W. Stubbs, *Constitutional History* (1897) vol i.

PANDURA, an ancient Oriental stringed instrument, a member of the lute family, having a long neck, a highly vaulted back, and originally two or three strings plucked by the fingers There were in antiquity at least two distinct varieties of pandura or tanbur (1) the more or less pear-shaped type used in Assyria and Persia and introduced by way of Asia Minor into Greece, whence it passed to the Roman empire; (2) the oval type, a favourite instrument of the Egyptians, also found in ancient Persia and among the Arabs of North Africa



BY COURTESY OF THE METROPOLITAN MUSEUM OF ART

TURKISH PANDURA

PANEGYRIC, a strictly formal public speech delivered in high praise of a person or thing In Athens such speeches were delivered at national festivals or games, with the object of rousing the citizens to emulate the glorious deeds of their ancestors The most famous are the *Olympiacus* of Gorgias, the *Olympiacus* of Lysias, and the *Panegyricus* and *Panathenaicus* (neither of them, however, actually delivered) of Isocrates Funeral orations, such as the famous speech put into the mouth of Pericles by Thucydides, also partook of the nature of panegyrics The Romans confined the panegyric to the living The most celebrated example of a Latin panegyric is that delivered by the younger Pliny (A D 100) on the occasion of his assumption of the consulship, containing a somewhat fulsome eulogy of Trajan Towards the end of the 3rd and during the 4th century, as a result of the orientalizing of the imperial court by Diocletian, it became customary to celebrate the superhuman virtues and achievements of the reigning emperor Twelve speeches of the kind have been collected under the title of *Panegyrici veteres latini* (ed. E. Bährens, 1874).

See C. G. Heyne, "Censura xii. panegyricorum veterum," in his *Opuscula academica* (1812) vi 80–118; H Ruhl, *De xii panegyricis latinis* (Greifswald, 1868) ; R. Pichon, *Les derniers écrivains profanes* (1906).

PANEL, originally a small piece of cloth or parchment; this meaning persists only in certain legal terms, such as jury panel, so-called from the original strip of parchment on which the names were written in early days; and in Scotch law in the use of the word for an indictment or for a person or persons named in an indictment; or in the use of the word for the cloth-stuffed lining of a saddle. In architecture and furniture, the word signifies, originally, a small piece of thin wood enclosed in a surrounding framework. Casts of charred wooden doors taken in Pompeii, as well as many ancient classic representations prove that the construction of wooden panels was well understood by the Greeks and Romans. Moreover, numerous Italian Romanesque wooden church doors of the 10th to the 12th centuries, usually of many small, nearly square panels, manifestly continue Roman types.

In much Gothic decorative work tracery forms are frequently used to divide a large surface into small recessed panels of various shapes. This decorative panelling is particularly common on tombs, screens, chancel rails and the like, in which multiplication of cusping frequently gives it great richness, especially in England In France, panelling is used with more restraint and in simpler forms, usually confined to slim, arch-headed shapes. During the late Gothic period of the 15th and 16th centuries, decorative panelling was used more lavishly throughout north Europe, and in the Perpendicular work of England large wall areas were often covered by a series of rectangular or Tudor arch-headed, sunk, tracery panels Meanwhile, the use of structural wood panelling, at first reserved for doors, cupboards, chests and similar furniture, was spreading to wainscotting; in this development the English lead. Occasionally an applied moulding is used at the sides and top only of a panel with a chamfer at the bottom The rich, interior, wood panelling of the Tudor and Elizabethan periods in England often combined with linenfold (*q v.*) decoration and sometimes with crude, classic pilasters and entablatures, is one of the most beautiful characteristics of those styles

In the Renaissance of Italy, panelling is of importance only in furniture such as choir stalls, etc , and in the rich coffered ceilings which cover many palace halls and church interiors In France, on the other hand, the use of panelling grew continuously more important as the Renaissance developed, and reached a climax in the lavish panelled interiors of the Louis styles (*q v.*) In this Louis panelling, as in work of the same date in England, the development is toward greater use of large panels made by glueing together smaller pieces of wood (T. F H)

PANGALOS, THEODORE (1878–), Greek soldier and politician, was born in Salamis of Albanian origin and in 1895 entered the Athenian Military Academy, whence he proceeded to complete his studies in Paris During the World War he commanded a regiment in Macedonia, in 1917 he held a post in the Ministry of War, in 1918 commanded the first infantry division and in 1919 was chief of the General Staff during the campaign in Asia Minor When the revolution of 1922 dethroned King Constantine for the second time, he was chairman of the commission of enquiry into the responsibilities for the Asiatic disaster, and was consequently concerned in the execution of the six Royalist ministers. In the first Republican cabinet of Papanastasiou in 1924 he was successively minister of Law and Order (for the repression of brigandage) and War On June 25, 1925, by a bloodless *coup d'état*, he made himself premier, then forced the Chamber to accept him, prorogued and subsequently dissolved it, took two Royalists into his cabinet as a sign of "reconciliation," and, Jan 3, 1926, became dictator In April 1926 Gen Pangalos was elected president of the Hellenic Republic in succession to Admiral Condouriotis But on Aug. 22 General Kondyles made a *coup d'état* against him in his absence at Spetsai. He was arrested without resistance, and imprisoned in the Cretan fortress of Izzeddin and subsequently in Athens He was released on July 10, 1928, and put himself up for Athens at the general election later in the year He did not get in, and since then has played no prominent part in Greek politics (W M)

PAN-GERMANISM. Pan-Germanism is the name given to an imperialist movement which, though it had long been gaining strength, received but little serious notice in Anglo-Saxon countries until the years immediately preceding the World War. Its importance may then have been exaggerated, yet there can be little doubt that it helped largely to popularize the belief that there had been at work in Germany forces bent upon ambitious schemes of territorial aggrandisement and political dominion.

Its Two Aspects.—There are, indeed, two aspects of Pan-Germanism—the purely national and defensive and the outspokenly chauvinistic and aggressive. The Pan-German is accustomed to describe his endeavours as merely designed to realize, under modern conditions, the ideas of men like Fichte, Arndt and other patriots who over a century ago looked to the time when the sundered German tribes would be gathered into one political fold. In the middle of the century the political economists Friedrich List and Wilhelm Roscher, both forward-looking in many ways, gave more purposive form to this vague notion of an all-embracing Germanic commonwealth. List dreamed of a German empire extending from the Adriatic to the Black sea, offering scope for German colonization for centuries to come. He also predicted the eventual inclusion in that empire of Holland, holding that without control of the mouth of the Rhine Germany was "like a house whose front door is owned by a neighbour."

List's speculations would appear to have given encouragement and direction to the later more definite activities of the Pan-Germanist movement; for many of the imperialistic schemes which have been advanced by contemporary writers are only variations or augmentations—mostly the latter—of his ideas. List's influence can first be traced in the works of men like Paul A. de Lagarde, Gustav A. C. Frantz and Paul Dehn, who all wrote on the subject in the '70s or '80s of last century. Thus, in his *Deutsche Schriften,* Lagarde wrote:—

> We must create a Central Europe which will guarantee the peace of the entire Continent from the moment when it shall have driven the Russians from the Black sea and the Slavs from the South and shall have conquered large tracts to the east of our frontiers for German colonization. We cannot let loose *ex abrupto* the war which will create this Central Europe. All we can do is to accustom our people to the thought that this war must come.

Frantz, too, in his book *Die Weltpolitik,* advocated the formation under German direction of a powerful confederation of States comprising, besides Germany, Austria, Holland, Belgium, Flanders,) Lorraine, Switzerland, Franche-Comté, Savoy, and, in the East, the Balkan principalities and Russian Poland.

During the years preceding the World War these ideas acquired a wide influence in Germany and were reinforced by influential political names. They had been kept alive by a host of writers of unequal merit, among the most influential being Ernst von Halle, Friedrich Lange and Ernst Hasse. The special aspect of the Pan-German question to which Hasse devoted his pen was "frontier policy," the title of his best-known book. One of his favourite schemes was the hedging of the empire on its landward frontiers by a military *glacis,* a day's march wide, to be settled by the families of ex-non-commissioned officers and other picked men who had had a military training. This real *Landwehr* was to be the *rocher de bronze* of which Frederick the Great spoke, a bulwark against which the attacks of Germany's enemies would hurl themselves in vain. He also advocated the incorporation in the German confederation of Belgium, Luxembourg, Holland and certain French frontier districts, as well as of Bohemia and Moravia (to be taken from Austria) and parts of Western Russia. For, he wrote: "We want territory, even if it be inhabited by foreign peoples, so that we may shape their future in accordance with our needs."

It was only in 1891 that the Pan-Germans resorted to systematic organization and propagandism. The colonial movement was then in full flood, and the idea of imperial expansion had captured the national imagination in a high degree. Five years before a congress of colonial enthusiasts and organizations had been called for conference in Berlin by Dr. Karl Peters, who later acquired a sinister notoriety. A loose federation of these bodies was formed for the more successful advancement of national interests, particularly territorial expansion, and Peters was for a time accepted as its head.

Formation of the League.—In 1891 this federation was reconstituted as the General German league (*Allgemeiner Deutscher Verband*) under pressure of the strong public feeling evoked by the conclusion of the Zanzibar convention of the previous year, by which Germany ceded to Great Britain a large part of her East African empire in exchange for the island of Heligoland. A membership of 20,000 appears to have been obtained, but this number gradually fell off to 5,000, until in 1894 the movement was taken in hand by Prof. Ernst Hasse of Leipzig, a fanatical imperialist, then a member of the imperial diet, who directed it for 15 years. Simultaneously the name Pan-German league (*Alldeutscher Verband*) was taken; the machinery of organization was improved and expanded; an energetic agitation by means of meetings, leaflets and a weekly news sheet, *Pan-German Papers* (*Alldeutsche Blätter*), was begun; and both members and money again came in freely.

The new league sought to create a world-wide national union of all the Germans, adopting as its motto the saying of the great elector of Brandenburg, Frederick William, the founder of the German colonial movement and the creator of the German navy: "Remember that you are Germans." The propagandist manifesto in circulation before the war set forth: "We must strengthen our national sentiment and bring home to the mass of our people the fact that Germany's development did not end in 1871." The programme of action comprised the following measures:—

> The quickening of the patriotic consciousness of Germans at home and the combating of all tendencies antagonistic to national development.
>
> The solution of questions relating to the education and training of the young and the schools in the sense of Germanism.
>
> The fostering and support of German national movements in all countries where our kinsmen have to struggle for the maintenance of Germanism, and the union of all Germans throughout the world. (At the same time Germans living abroad were warned against direct interference in the internal affairs of the countries of their adoption.)
>
> The promotion of an energetic German "policy of interests" in Europe and across the seas, and especially the carrying forward of the colonial movement to practical objectives.

Had the Pan-Germans kept their endeavours within the limits of the party's programme much reproach might have been saved them later. Individual members of the league, however, were not slow to supplement its avowed aims by all sorts of immoderate schemes of aggression in Europe, Asia Minor and Africa. As time passed and the relations of the Great Powers became increasingly strained, the league itself developed into a powerful piece of political machinery. The fact that many of its members sat in the imperial diet gave to the league an excellent forum for the propagation of its ideas, and in all the more critical episodes and controversies in foreign politics during two decades prior to the war it proved an unwearying exponent of a spirited imperialist policy.

Yet influential though the Pan-Germanist movement was before the war, and inflammatory as was much of its influence on public opinion, injustice would be done by identifying the German nation as a whole with its more aggressive propagandism. In the main the movement appealed to and was embraced by the powerful nationalist and chauvinist parties—in other words, by the military men and the political reactionaries—for though many intellectuals supported the league the soberer heads among them kept aloof, and the historian Mommsen even called the Pan-Germans "patriotic idiots."

Character of Pan-Germanism.—It would be equally unfair to draw general conclusions from the many extravagances which were uttered and written in Germany during the years of war. The real significance of the Pan-German propagandism at that time lay in the new importance attached to the idea of a Central European confederation under German influence, then revived by Dr. F. Naumann in his book *Mittel-Europa,* perhaps the ablest contribution from the German side to the literature of a "new Europe," the expansion of the old Berlin-to-Baghdad programme into a grandiose scheme of empire extending from Antwerp and the North sea to Basra and the Persian gulf, and the claim to a vast consolidated colonial empire stretching across tropical Africa, to be acquired at the expense of France, Belgium and particularly of Great Britain. These ambitious projects are not recalled in order to prove that the war aims of Germany were more immodest than those of some of her enemies, still less for the purpose of pointing the contrast between aspiration and achievement, but rather as showing how many years of intensive Pan-Germanic

agitation had clearly familiarized the national mind with the idea of imperial expansion as one which might be better realized by force of arms than by the slow methods of peaceful penetration.

When criticized, the Pan-Germanist is ready with his answer. "Put yourself in our position," he says; and the challenge is one to be met. Viewing the question from the German standpoint it is not difficult to discover facts and tendencies in national and international politics that explain, and within limits may be said to have condoned, the anxiety and spirit of unrest which settled upon Germans when, in 1885 or thereabouts, they began to feel the pressure of the population question, the growing need for new markets and the stirring of ambitions which pointed outwards. It is significant that the movement made its greatest advance when J. Chamberlain, colonial secretary from 1895–1902, was uttering his clear and resounding call to the commonwealths of the British empire to coalesce and to raise their frontier barriers, commercially, to the outer world. In the past the British empire had opened its door freely to Germans as immigrants and traders, but it was suspected that they were no longer as welcome as heretofore. Even had it been otherwise, the Germans chafed against the inequality in the partition of the undeveloped territories of the earth which compelled their emigrants to seek homes under alien flags and thus to be eventually lost to the fatherland. Further, while many German politicians feared a future agglomeration of the Anglo-Saxon races, the whole nation was haunted by the twofold menace of a restless Russia in the East and of a France in the West unreconciled to the loss of territory in 1871.

These and other facts, weighing on an emotional and politically immature people, probably gained for Pan-Germanist ideas a hearing and a sympathy which in different circumstances might have been refused to them. When all due allowances have been made, however, it is but the more justifiable to say that the Pan-Germanism of the past was condemned by its excesses. The great mistake of the Pan-Germans of pre-war days was that they allowed a justifiable national pride and an eager and natural hankering for more elbow-room to degenerate into hostile designs against other nations which, owing to historical reasons, had preceded Germany in the colonization of the empty spaces of the earth, and that they often avowed these designs with so brutal a candour. Since the war the Pan-German league, refraining from aggressive agitation, has concentrated its attention upon the task of strengthening the national sentiment and spirit, hardly tried by adversity. The latest version of its statutes (Feb. 1927) is substantially directed towards the political rehabilitation of Germany as a great Power and the removal of the territorial and economic penalties imposed by the Treaty of Versailles. Stress is laid upon the maintenance and strengthening of the national spirit, the cultivation of the German individuality, the need for a powerful defence force, the recovery of the lands of which Germany has been deprived and the union of German-Austria with the Reich. From the beginning the movement had had a definite anti-Semitic bias, and Jews are bracketed with people of coloured race as ineligible for membership of the Pan-German league.

The Movement in Austria.—The most important development of the Pan-German movement since the war is the great stimulus which it has received in Austria. There an autonomous league was formed in 1919 with an independent organization; and working from Graz it has carried on a vigorous agitation in all parts of the country, and has even succeeded in making its influence felt in the German districts which have passed from Austrian rule under the Treaty of St. Germain. While its programme has much in common with that of the parent league, it emphasizes union with Germany as the hope of the future.

That great enthusiasm is being thrown into the agitation is shown by the fact that some 200 local branches of the league have been organized, representing an enrolled membership of many thousands. These Austrian reunion endeavours practically revive the Great Germany movement of the middle of last century. It is not the least strange of the ironies of history that an idea which at that time reft in twain the old German Bund should serve to-day as a symbol of national unity. Local groups exist in other countries where Germans are numerous, and particularly in America.

BIBLIOGRAPHY.—The German literature of the Pan-German movement is very large and inevitably of very unequal value. Better known writers include, besides those already named, Alexander von Pecz, Albert Ritter, Gen. Friedrich von Bernhardi, the Anglo-German Houston S. Chamberlain, Baron L. von Vietinghoff, Count von Reventlow, Albrecht Wirth, H. Frobenius and Friedrich Lange. Noteworthy German works on the league itself are an official survey of Pan-Germanic endeavours entitled *Zwanzig Jahre alldeutscher Arbeit und Kämpfe* (1910); Martin Wenck's *Alldeutsche Taktik* (*Pan-German Tactics*) (1917); and Otto Burchard's *Geschichte des alldeutschen Verbandes* (1920). Of a number of works in English there may be named Rowland G. Usher's *Pan-Germanism* (1913), and a translation of Charles Audler's *Pan-Germanism*, published in 1915. (W. H. DA.)

PANGOLIN, the name given to scaly ant-eaters comprising several genera of the family *Manidae* of the order Edentata (*q.v.*). These animals are found in tropical Asia and in Africa, ranging from 1 to 3ft. in length, exclusive of the tail, which may be shorter than, or twice the length of, the rest of the body. The legs are short and the tongue long and worm-like. There are no teeth. Except the under surface of the body and, in two African species, the lower part of the tip of the tail, the whole animal is covered with broad, overlapping, horny scales. The Asiatic species, three in number, are characterised by hairs between the scales and by small external ears. These are wanting in the four African species. The commonest Asiatic form is *Manis pentadactyla* of India.

WHITE-BELLIED PANGOLIN, OF TROPICAL AFRICA

PANIC. By panic, in the economic sense, we mean a psychological state in which either or both of the two following beliefs are irrationally entertained—viz., either that the banks are not in a position to repay their depositors or that they are not in a position to lend, so that the normal processes of the money market will be completely upset. The synonym for the first type of Panic is the Run: of the second, the Financial Crisis. The first is marked by a demand by the public for legal tender, in extreme cases, by a demand for *gold:* the second is marked by a demand for *bank balances*, that is, loans, which are hoarded by the borrowers for the same reason that notes or gold are hoarded by the depositor: not because the money is needed at once, but because it may not be available in case it is needed. Examples of the financial panic are the crises of 1847, 1857 and 1866 in Great Britain, which led to the suspension in each case of the Bank Charter Act: of the run, the state of affairs in New York in the autumn of 1907.

Since the run is a purely irrational mob manifestation, based upon the instinct of self-preservation, it cannot be met in any other way than by boldness. The claims of the depositors must be met without argument and without question because, at the height of the run, any attempt at expostulation will be interpreted as a sign that all is not well, and the run thereby becomes intensified. It follows from this that during a run the commercial banks cannot afford to see any really sound concern go to the ground: for a weakening of one link in the chain may lead to the ruin of all.

What applies to a run, is also true of those morbid states of the money market which are known as financial crises If loans really *are* refused, the only effect is to intensify the evil. And thus, both in the case of runs and in the case of financial panics, what is required is some organisation which is prepared to assume the responsibilities of leadership in the moment of peril. This organisation in the modern world is the central bank. The rules by which a central bank ought to be guided in the event of a financial crisis were worked out empirically by the Bank of England between

1825 and 1866, and were erected into a philosophy in Walter Bagehot's celebrated book, *Lombard Street* (1873).

These rules are essentially two in number. The first is that loans ought to be made freely and on any security, provided that that security is in itself sound. The knowledge that loans can be got is in itself an element of pacification. The second rule is that the loans so made should be made at a high price, for otherwise an amount will be demanded which it may not be within the power even of a central bank to grant, and a higher price will in itself be a deterrent to purposeless borrowing induced merely by fear.

In the case of Great Britain, experience in the middle part of the 19th century showed very conclusively that the mere existence of a central bank does not of itself allay a financial panic, so long as the ability of a central bank to lend freely is doubted. Owing to the provisions of the Bank Charter Act of 1844, the ability of the Bank of England to lend was doubted, and it was not until the issue of the so-called "Government Letter," by which the Bank was advised that in the event of its breaking the law by issuing a volume of notes in excess of the statutory amount the Government would seek to obtain an Act of Indemnity from Parliament, that excitement was allayed. The modern central bank, which is given power to issue notes in excess of any statutory reserve percentage, provided that it is prepared to pay a tax upon the amount so issued in excess, is in a very much stronger position. This valuable element of elasticity was provided in Great Britain by the terms of the Currency and Bank Notes acts, 1914–5, by which the Bank could increase its fiduciary circulation with the consent of the Treasury: an element of safety which is perpetuated by the new Currency and Bank Notes act (1928).

The severity of financial crises and the frequency of runs diminished very greatly in the last decade of the nineteenth century and the opening years of the twentieth century. This was due to a gradual realization by bankers that the true method of cure lay in prevention: that is, in the maintenance of high standards of caution and discretion in the granting of loans. The result was that the Baring crisis of 1890 was successfully surmounted without the necessity of having recourse to a suspension of the Bank act of 1844. Since that time until the outbreak of the war, whilst there were isolated cases of runs against particular banks (Birkbeck Building Society, Yorkshire Penny Bank) there was no general crisis involving even the discussion of the expediency of suspending the act of 1844, until the outbreak of the World War of 1914. The older conception of the phenomenology of the trade cycle, in which the transition from boom to decline was marked by panic in the money market, if not by the failure of a certain number of commercial banks, has long since disappeared in Europe. (T. E. G.)

United States.—The principal panics witnessed in the United States may be sketched as follows (original compilation made by the *Wall Street Journal,* of New York). Jay Cooke and Co. failed on Sept. 18, 1873; on the following day Fisk and Hatch suspended; runs on the Fourth National Bank and the Union Trust Company followed; on Sept. 20, the Union Trust Company, the Bank of the Commonwealth, and the National Trust Company failed. The stock market experienced wild panic and excitement, which became so great that the governors of the Exchange announced at 11 A.M. that day trading would be suspended indefinitely. On Sept. 30 trading was resumed. Among other dates of interest in Wall Street may be mentioned Black Friday (*q.v.*), Sept. 24, 1869. It was on this day that the Gould-Fisk clique attempted to corner the gold supply. After forcing the price up from 150 in the morning to 162½ at noon, the price dropped precipitately to 133, causing many failures and wild panic. The Government broke the corner by selling $4,000,000 in gold. On May 8, 1884, Grant and Ward failed; Ex-President Grant was subsequently ruined. The Marine Bank failed and pandemonium reigned in the stock market.

Panic as the result of the Baring failure in London began on Nov. 10, 1890. Call money reached 186%; the North River Bank suspended; the Clearing House issued certificates on Nov. 11. On May 3, 1893, panic again set in; call money reached 40% and there were many bank failures in the United States and in Australia. Several brokerage houses failed and prolonged business depression followed. May 9, 1901, witnessed one of the worst stock market disturbances in history. This panic, known as the Northern Pacific corner, was precipitated by the contest between the Harriman-Kuhn-Loeb interests on one side and the Hill-Morgan on the other, for the control of the Northern Pacific road. From a price of 106 on May 6, quotations on stock of this road jumped to 1,000 on cash sales (May 8). On May 9, the whole list collapsed. Union Pacific common dropped from 113 to 76; Southern Pacific common dropped from 49 to 29; Atchison from 78¼ to 43; Baltimore and Ohio from 102 to 84; steel common from 47 to 24; steel preferred from 98 to 69. Call money went to 75%.

The panic of 1907 occurred in October and was the direct result of the collapse of the copper industry; the price of that metal dropped in six months from 26 cents to 12 cents. The Knickerbocker Trust Company closed its doors on Oct. 22; on Oct. 23, a run was started on the Trust Company of America. The run continued throughout the month and is regarded as one of the most stubborn in history. The stock market was in a panic and other runs started. Steel common touched 27⅛; call money reached 125%. Under the provision of the Federal Reserve Act (*q.v.*) enacted in 1913, it is believed that the United States will hereafter be more free from financial panics. (J. H. B.)

PANICLE, in botany the name given to an inflorescence which is a compound raceme (*q.v.*) as in oats. (*See* also FLOWER.)

PANICUM, a genus of grasses (*q.v.*) comprising some 500 species, found chiefly in the warmer regions of both hemispheres, about 150 occurring in the United States. Several are important cereals, as *P. miliaceum* (common millet), cultivated for food in India and Europe; others are valuable forage plants, as *P. maximum* (guinea-grass) and *P. barbinode* (Para grass), the only grasses extensively grown for forage in tropical America. Representative North American species are *P. capillare* (old-witch grass), *P. virgatum* (switch-grass) and *P. texanum* (Texas millet).

PANIN, NIKITA IVANOVICH, COUNT (1718–1783), Russian statesman, was born at Danzig on Sept. 18, 1718. He passed his childhood at Pernau, where his father was commandant. In 1740 he entered the army, and rumour had it that he was one of the favourites of the empress Elizabeth. In 1747 he was accredited to Copenhagen as Russian minister, but a few months later was transferred to Stockholm, where for the next twelve years he played a conspicuous part as the chief opponent of the French party. It is said that during his residence in Sweden Panin, who certainly had a strong speculative bent, conceived a fondness for constitutional forms of government. Politically he was a pupil of Alexis Bestuzhev; consequently, when in the middle 'fifties Russia suddenly turned Francophil instead of Francophobe, Panin's position became extremely difficult. However, he found a friend in Bestuzhev's supplanter, Michael Vorontsov, and when in 1760 he was unexpectedly appointed the governor of the little grand duke Paul, his influence was assured. He was on Catherine's side during the revolution of 1762, but his jealousy of the influence which the Orlovs seemed likely to obtain over the new empress predisposed him to favour the proclamation of his ward the grand duke Paul as emperor, with Catherine as regent only.

Panin was never chancellor; but he was the political mentor of Catherine during the first eighteen years of her reign. He was the inventor of the famous "Northern Accord," which aimed at opposing a combination of Russia, Prussia, Poland, Sweden, and perhaps Great Britain, against the Bourbon-Habsburg League. The idea, though never quite realized, influenced the policy of Russia for many years. It explains, too, Panin's tenderness towards Poland, whom he regarded as an indispensable member of his "Accord," wherein she was to supply the place of Austria, whom circumstances had temporarily detached from the Russian alliance. All the diplomatic questions concerning Russia from 1762 to 1783 are intimately associated with the name of Panin. It was only when the impossibility of realizing the "Northern Accord" became patent that his influence began to wane.

After 1772, when Gustavus III. upset Panin's plans in Sweden, Panin became more and more subservient to Frederick II. of Prussia. As to Poland, his views differed widely from the views

of both Frederick and Catherine. He seriously guaranteed the integrity of Polish territory, after placing Stanislaus II. on the throne, in order that Poland, undivided and as strong as circumstances would permit, might be drawn wholly within the orbit of Russia. But he did not foresee the complications which were likely to arise from Russia's interference in the domestic affairs of Poland. Thus the confederation of Bar, and the Turkish War thereupon ensuing, took him completely by surprise. He was forced to acquiesce in the first partition of Poland, and when Russia came off third best, Gregory Orlov declared in the council that the minister who had signed such a partition treaty was worthy of death. Panin further incensed Catherine by meddling with the marriage arrangements of the grand duke Paul and by advocating a closer alliance with Prussia, whereas the empress was beginning to incline more and more towards Austria.

Nevertheless, even after the second marriage of Paul, Panin maintained all his old influence over his pupil, who, like himself, was now a warm admirer of the king of Prussia. There are even traditions from this period of an actual conspiracy of Panin and Paul against the empress. As the Austrian influence increased Panin found a fresh enemy in Joseph II., and the efforts of the old statesman to prevent a matrimonial alliance between the Russian and Austrian courts determined Catherine to get rid of a counsellor of whom, for some mysterious reason, she was secretly afraid. The final rupture seems to have arisen on the question of the declaration of "the armed neutrality of the North"; and in May 1781 Panin was dismissed. He died in Italy on March 31, 1783. Panin was one of the most learned, accomplished and courteous Russians of his day. Catherine called him "her encyclopaedia." The earl of Buckinghamshire declared him to be the most amiable negotiator he had ever met. He was also of a most humane disposition and a friend of Liberal institutions.

Bilbasov, *Geschichte Katharina II.* (Berlin, 1891–1893); A. Brückner, *Materials for the Biography of Count Panin* (Rus.; St Petersburg, 1888).

(R. N. B.; X.)

PANIPAT, a town of British India, in Karnal district of the Punjab, 53 m. north of Delhi by rail. Pop. (1921), 27,343. The town is of great antiquity, dating back to the great war of the *Mahābhārata* between the Pāndavas and Kaurava brethren. In modern times, the plains of Panipat thrice formed the scene of decisive battles which sealed the fate of upper India—in 1526, when Bābur completely defeated the imperial forces; in 1556, when his grandson, Akbar, on the same battlefield, conquered Himu, the Hindu general of the Afghān Adil Shāh; and finally, on the 7th of January 1761, when Ahmad Shāh Durāni shattered the Mahratta confederacy.

PANIQUITAN, a group of tribes of South American Indians, constituting a linguistic stock or more probably sub-stock. The Paniquitas, from whom the group takes its name, lived in Colombia in the Cordillera Central between the upper Cauca and Magdalena rivers, between 2° and 3° N. lat. Other tribes of the stock held the region between the rivers as far north as 5° N. lat. together with both banks of the Magdalena as far south as Neiva. The Paniquitan tribes were bitter enemies of the Chibchas (*q.v.*) whom they bordered on the west and south. Unlike the Chibchas and like the peoples to the north and east they used the blowgun and employed poisoned darts and arrows. From some of the early accounts they appear to have been head-hunters.

See P. de Aguado, *Historia de Santa Marta y Nuevo Reino de Granada, 1575* (Madrid, 1916); H. Pittier de Fabrega, "Ethnographic and linguistic notes on the Paez Indians of Tierra Adentro, Cauca, Colombia" (*Mem. Amer. Anthropological Assoc.* vol. i.); H. Beuchat and P. Rivet, "Affinités des langues de la sud de la Colombie, etc." (*Museon,* vol. xi.).

PANISLAMISM. This word was first employed in journalistic literature in the early '80s of the 19th century to describe the efforts made in the Muslim world to bring about some unity of action in opposition to the Christian powers of Europe. Invented to express what was believed to be a new order of circumstances, the word has led to much misunderstanding, since it has obscured the facts that Muhammadan political theory has always embodied a hostile attitude towards unbelievers unless they submitted to Muhammadan rule, and that the ideal of the unity of all believers has formed an integral part of the religious outlook of Islam since its very inception. The only new circumstance in the relations between the Christian Powers and the various Muslim populations was that the expansion of the Press in the East had improved methods of communication and had enormously facilitated the rapid circulation of ideas. The alarmists who regarded Panislamism as a danger, credited Sultan Abdul Hamid II. (1876–1909) with a wide-spread propaganda designed to gain for himself recognition as the spiritual head of all the Muslims throughout the world, whatever might be the Government to which they owed temporal allegiance. It was feared that this recognition of the sultan of Turkey as Caliph might be a cause of political disturbance among the Muhammadan subjects of European Powers. The growing decline of political power in the Muhammadan world had indeed given to Turkey an increasing importance in Muslim eyes as being the single Muhammadan state of importance that could take part in the councils of Europe. But the emissaries of Abdul Hamid were ill-chosen, and the success of their efforts appears to have been slight, and the Panislamist movement was mainly confined to journalistic denunciations of the oppression of the Muslims by Christian Governments and exhortations to promote the unity of Islam. But no practical scheme was worked out, and Abdul Hamid who was theoretically the head of the movement, showed great discretion and restraint in his propaganda, which was rendered the less effective by the profound distrust which his cruelty and despotism excited especially among his own subjects. After his deposition an attempt was indeed made by the Committee of Union and Progress at the Salonika Congress of 1911 to adopt a definite scheme of Panislamic propaganda, and it was resolved that a congress of delegates from all the Muslim countries of the world ought to meet annually in Constantinople to discuss questions of interest to all Muslims. Emissaries appear to have been actually sent out during these years to win or to confirm adherents to the Ottoman Caliph wherever Muslims were subject to Europeans, even to remote parts of Africa, including Morocco; others worked among the Muslims of China.

Attempts were also made to deal with the old difficulty which had confronted Panislamism, the schism between Sunni and Shi'ah. Early in 1911 a letter was published by a number of Ottoman and Persian jurists assembled at Nejef, asserting that there was no difference of principle between the two sects and urging co-operation between the two empires, Persia being at that time, it was supposed, menaced by England and Russia. The sympathies of the Muhammadan world became again focussed on Turkey with the outbreak of the Italian war in Sept. 1911 and of the Balkan war in Oct. 1912. The talk about the need for union between Muslims was renewed in the Muhammadan press throughout the world and it became more widely realised among them that someone claiming to be their Caliph existed.

But the outbreak of the World War in 1914 revealed the weakness of Panislamism, and the more active influence of nationalist feeling thrust the Panislamic idea into the background. The European Powers against whom it was directed—England, France, Russia and afterwards Italy—received during the course of it great proofs of loyalty and attachment from their Muslim subjects; and it seems clear that there was little sense of unity with the Turks on the ground of common religion on the part of these populations, in which, on the contrary, the sense of loyalty to the empires within which they are incorporated had been developed. The proclamation of a *jihād* with no response shows that the time for the employment of that instrument had passed, if it was ever effective. The reduction of the Ottoman Empire after the conclusion of the war to a comparatively small area produced a feeling of depression among the Islamic peoples, who could no longer look with confidence to a great Islamic Power as the natural leader in any scheme for the recovery of hegemony in Asia and Africa. The Turkish republic (one of the few independent Muhammadan states now surviving) on more than one occasion made it clear that it did not concern itself with the fate of Muslim populations in other countries.

This attitude of aloofness on the part of the Turkish Government dealt a severe blow at Panislamism, for those who worked for the unity of Islam during the 19th century had looked on Turkey as the rallying point of their efforts The last refuge of the Panislamist movement was India, in which the Khilafat movement was started in Oct. 1919, maintaining that the dignity of the Caliphate required that the holder of this office should be left in possession of territories adequate for the defence of the faith, and that the guardianship of the Holy Places should remain in his hands. But the declaration of a republic in Turkey in Oct 1923, followed in March 1924 by the abolition of the Caliphate, compelled the Indian Muhammadans to adopt a new programme, and accordingly the Central Khilafat Committee, at its meeting in Bombay in May 1924, resolved in future to endeavour to promote friendly relations between the various Muslim countries and to exchange communications regarding a settlement of the Caliphate question, in accordance with the Sacred Law of Islam The altered circumstances of the problem were much discussed in Egypt and Java also, and as a result two separate congresses were held in 1926, the Caliphate Congress in Cairo and the All-Muslim Congress in Mecca But in neither of these gatherings was any decision of a practical nature arrived at, and it is uncertain whether any attempt will be made to convene such meetings again

PANIZZI, SIR ANTHONY (1797–1879), English librarian, was born at Brescello, in the duchy of Modena, Italy, on Sept. 16, 1797 After taking his degree at the university of Parma, Antonio Panizzi became an advocate He was implicated in the revolutionary movement of 1821, and escaped arrest by a precipitate flight. He first established himself at Lugano, but was expelled from Switzerland at the joint instance of Austria, France and Sardinia He came to England in May 1823, in a state bordering upon destitution His countryman, Ugo Foscolo, provided him with introductions, and he earned a living for some time by giving Italian lessons By Brougham's influence he was made, in 1828, professor of Italian at University College, London In 1831 Brougham, then lord chancellor, obtained for him the post of an extra assistant librarian of the Printed Book department Panizzi was then working at his edition of Boiardo's *Orlando innamorato* Boiardo's fame had been eclipsed for three centuries by the adaptation of Berni; and it is highly to the honour of Panizzi to have redeemed him from neglect His edition of the *Orlando innamorato* and the *Orlando furioso* was published between 1830 and 1834, prefaced by an essay on the influence of Celtic legends on mediaeval romance In 1835 he edited Boiardo's catalogue of the library of the Royal Society

To the parliamentary committee (1835–36) to inquire into the management of the British Museum Panizzi contributed an enormous mass of statistics respecting foreign libraries, and evidence on the catalogue of printed books then in contemplation In 1837 he was appointed keeper of printed books The entire collection, except the King's Library, had to be removed from Montague House to the new building, the reading-room service had to be reorganized, rules for the new printed catalogue had to be prepared, and the catalogue itself undertaken All these tasks were successfully accomplished; and the rules of cataloguing devised by Panizzi and his assistants became the basis of subsequent work His report, printed in 1845, upon the museum's extraordinary deficiencies in general literature, ultimately procured the increase of the annual grant for the purchase of books to £10,000. His friendship with Thomas Grenville (1755–1846) led to the nation being enriched by the bequest of the unique Grenville library In 1847–1849 a royal commission sat to inquire into the general state of the museum, and Panizzi was the centre of the proceedings. His administration, fiercely attacked from many quarters, was triumphantly vindicated in every point Panizzi did not succeed to the principal librarianship until 1856. It was thus as merely keeper of printed books that he conceived and carried out the achievement by which he is probably best remembered—the erection of the new library and reading-room. Purchases had been discouraged from lack of room in which to deposit the books. Panizzi cast his eye on the empty quadrangle enclosed by the museum buildings, and conceived the idea of occupying it with a central cupola too distant, and adjacent galleries too low, to obstruct the inner windows of the original edifice The cupola was to cover three hundred readers, the galleries to provide storage for a million of books. The original design, sketched by Panizzi's own hand on April 18, 1852, was submitted to the trustees on May 5; in May 1854 the necessary expenditure was sanctioned by parliament, and the building was opened in May 1857

Many important additions to the collections were made during his administration, especially the Temple bequest of antiquities, and the Halicarnassean sculptures discovered at Budrun (Halicarnassus) by C. T Newton Panizzi retired in July 1866, but continued to interest himself actively in the affairs of the museum until his death, on April 8, 1879. He had been created a K C.B in 1869

His administrative faculty was extraordinary. to the widest grasp he united the minutest attention to matters of detail. His moral character was the counterpart of his intellectual: he was warm-hearted and magnanimous; extreme in love and hate—a formidable enemy, but a devoted friend His intimate friends included Lord Palmerston, Gladstone, Roscoe, Grenville, Macaulay, Lord Langdale and his family, Rutherford (lord advocate), and, above all perhaps, Francis Haywood, the translator of Kant His greatest friendship was with Prosper Mérimée (R G ; X)

See Fagan, *Life of Sir Anthony Panizzi* (1880)

PANJABI LANGUAGE (alternatively PUNJABI), the language of the Central Punjab (properly Panjāb) It is spoken by over 71,000,000 people between (approximately) the 77th and 74th degrees of east longitude The vernacular of this tract was originally an old form of the modern Lahndā, a member of the outer group of Indo-Aryan languages (*q v*), but it now belongs to the intermediate group, possessing most of the characteristics of the Midland language, with occasional traces of the old outer basis which become more and more prominent as we go westwards At 74° E it merges into the modern Lahndā

The vocabulary of Panjabi is very similar to that of western Hindi Panjabi has no literature to speak of and is free from the burden of words borrowed from Persian or Sanskrit, only the commonest and simplest of such being found in it. Its vocabulary is thus almost entirely *tadbhava*, and, while capable of expressing all ideas, it has a charming rustic flavour, like the Lowland Scots of Burns, indicative of the national character of the sturdy peasantry that employs it The indigenous alphabet of the Punjab is called *Landā* or "clipped" It is related to Nāgarī, but is hardly legible to any one except the original writer, and sometimes not even to him To remedy this defect an improved form of the alphabet was devised in the 16th century by Angad, the fifth Sikh Guru, for the purpose of recording the Sikh scriptures It was named *Gurmukhī*, "proceeding from the mouth of the Guru," and is now generally used for writing the language

See *Linguistic Survey of India*, vol ix pt 1, p 607, *seq* for a full account with specimens of the language and bibliography.

PANJDEH or PENJDEH, a village in the Turkmen S S R in 36° 10′ N, 62° 30′ E, rendered famous by "the Panjdeh scare" of 1885 It is situated on the east side of the Kushk river near its junction with the Murghab at Pul-i-Khishti In March 1885 when the Russo-Afghan Boundary Commission should have been engaged in settling the boundary-line, this portion of it was in dispute between the Afghans and the Russians. A part of the Afghan force was encamped on the west bank of the Kushk, and on March 29 General Komarov sent an ultimatum demanding their withdrawal On their refusal the Russians attacked them at 3 A M on March 30 and drove them across the Pul-i-Khishti Bridge with a loss of some 600 men. The incident nearly gave rise to war between England and Russia; but the amir Abdur-Rahman, who was present at the Rawalpindi conference with Lord Dufferin at the time, affected to regard the matter as a mere frontier scuffle The border-line subsequently laid down gives

to Russia the corner between the Kushk and Murghab rivers as far as Maruchak on the Murghab, and the Kushk post has now become the frontier post of the Russian army of occupation.

PANKHURST, EMMELINE (1858–1928), British suffragist, the daughter of Robert Goulden, a calico-printer of Manchester, was born July 14, 1858. From 1873 to 1877 she was educated at the École Normale in Paris, where she came under the influence of a daughter of Henri Rochefort. In 1879 she married Richard Marsden Pankhurst, a barrister and an advocate of women's suffrage, and served with him on the committee which promoted the Married Women's Property Act. She was at that time a member of the Manchester Women's Suffrage Committee and, during a short residence in London in 1886, took part in the strike of the match girls at Bryant and May's factory. In 1889 she helped to found the Women's Franchise League, and in 1892 left the Liberal Party and became a member of the Independent Labour Party. Returning to Manchester in 1893, she acted for five years as Poor Law guardian. On the death of her husband in 1898 she took the post of registrar of births and deaths at Chorlton-on-Medlock, but was later obliged to resign on account of her propaganda activities. In October 1903, inspired by her daughter Christabel, she was chiefly instrumental in founding the Women's Social and Political Union on a non-party basis.

Having failed to induce the Liberal party to make votes for women a part of their programme she utilized her organization to oppose their candidates, took headquarters in London, held public meetings and organized processions and deputations to the House of Commons. On May 16, 1906, she spoke for her society at a joint deputation of suffrage societies which met Sir H. Campbell-Bannerman at the Foreign Office. But the Liberal party being divided on the question, their leaders refused facilities for the discussion of private bills. In Feb. 1908 Mrs. Pankhurst was arrested on her way to the House of Commons with a petition for the Prime Minister, but was released from prison on grounds of ill-health after the expiration of five weeks of her six weeks' sentence. Later in the same year she was imprisoned in Holloway for inciting to a breach of the peace, and once more in 1909 she was arrested for a technical assault. She entered an appeal founded on the Bill of Rights and a statute of Charles II., and pending the hearing undertook a lecturing tour in America and Canada. During her absence some unknown person paid her fine. In 1910 there was a short lull in the movement pending the consideration of a moderate measure framed by a non-party committee of the House, but as the Government opposed the measure the agitation was again resumed. The census was boycotted in 1911, and on her return from a second American visit at the end of the year Mrs. Pankhurst and her daughter directed a window-breaking campaign. Mrs. Pankhurst was sentenced to 9 months' imprisonment for inciting to violence in March 1912.

In 1913–4 arson and the destruction of property were added to the methods of the W.S.P.U. After the bomb outrage at Lloyd George's house at Walton, Mrs. Pankhurst was sentenced at the Old Bailey to three years' penal servitude. After serving at intervals less than three weeks of her sentence she joined her daughter Christabel in Paris and later went to America. In the summer of 1914, when she had again been re-arrested and released several times after her return to England, the remainder of her term was allowed to lapse.

At the outbreak of the World War Mrs. Pankhurst and her eldest daughter, supported by the other militant leaders, lent their organization to the cause of national service. Mrs. Pankhurst, an exceptionally able public speaker, devoted her energies to the encouragement of recruiting in England and America. In 1917 Mrs. Pankhurst visited Russia and subsequently, for the benefit of her health, spent some years in Canada and Bermuda. On her return to England at the end of 1925 she again showed great interest in politics. At the time of her death (London, June 14, 1928) she was the candidate for Whitechapel and St. George's nominated by the Conservative Party, which she had joined after the passing of the Representation of the People Act, 1918, which included the extension of the suffrage to women.

Mrs. Pankhurst had one son, who died in 1910, and three daughters. Christabel (b. 1880) has abandoned politics. Sylvia (b. 1882) opposed the war, became a Communist, and was imprisoned in 1920 under the Defence of the Realm Act. *See* E. Pankhurst, *My Own Story* (1914).

PANLOGISM, in philosophy, is the metaphysical theory that thought or reason is the ultimate reality, or that the universe is completely rational or intelligible (Greek πᾶν, all, λόγος, reason). The term is sometimes applied to the absolute idealism of Hegel. *See* IDEALISM; HEGEL.

PANNAGE, an English legal term for the feeding of swine in a wood or forest, hence used of a right or privilege to do this.

PANNONIA, a country bounded north and east by the Danube, conterminous westwards with Noricum and upper Italy, and southward with Dalmatia and upper Moesia. Its original inhabitants were probably of Illyrian race. From the 4th century B.C. it was invaded by various Celtic tribes, probably survivors of the hosts of Brennus. Little is heard of Pannonia until 35 B.C., when its inhabitants, having taken up arms in support of the Dalmatians, were attacked by Augustus, who conquered and occupied Siscia (Sissek). The country was not, however, definitely subdued until 9 B.C., when it was incorporated with Illyria, the frontier of which was thus extended as far as the Danube. In A.D. 7 the Pannonians, with the Dalmatians and other Illyrian tribes, revolted, and were overcome by Tiberius and Germanicus, after a hard-fought campaign which lasted for two years. In A.D. 10 Pannonia was organized as a separate province. The proximity of dangerous barbarian tribes (Quadi, Marcomanni) necessitated the presence of a large number of troops (seven legions in later times), and numerous fortresses were built on the bank of the Danube. Some time between the years 102 and 107, which marked the termination of the first and second Dacian wars, Trajan divided the province into Pannonia *superior,* the western, and *inferior*, the eastern portion.

Under Diocletian a fourfold division of the country was made. In the middle of the 5th century Pannonia was ceded to the Huns by Theodosius II., and after the death of Attila passed into the hands of the Ostrogoths, Longobards (Lombards), and Avars.

The inhabitants of Pannonia are described as brave and warlike, but cruel and treacherous. Except in the mountainous districts, the country was fairly productive, especially after the great forests had been cleared by Probus and Galerius. Before that time timber had been one of its most important exports. Its chief agricultural products were oats and barley, from which the inhabitants brewed a kind of beer. Pannonia was famous for its breed of hunting-dogs.

The native settlements consisted of *pagi* (cantons) containing a number of *vici* (villages), the majority of the large towns being of Roman origin. In Upper Pannonia were Vindobona (Vienna), probably founded by Vespasian; Arrabona (Raab), a considerable military station; Savaria or Sabaria (Stein-am-Anger), founded by Claudius, a frequent residence of the later emperors, and capital of Pannonia *prima*. In Lower Pannonia were Sirmium (first mentioned in A.D. 6, also a frequent residence of the later emperors), and Sopianae (Fünfkirchen), an important place at the meeting of five roads.

PANOAN, an independent linguistic stock of South American Indians, so called from the Pano, one of its important tribes. The Indians of this stock occupy a large area in north-eastern Peru and the adjacent parts of Brazil and Bolivia. The region may be roughly described as covering the territory south of the Amazon between the mouths of the Huallaga and Yaruri rivers, and including the region along the Huallaga, Ucayali, upper Yurua and Purus rivers extending south to the lower Beni and Mamore in about 12° S. lat. The better known tribes are the Cashibos, Chacobos, Conibos, and Shipibos.

PANORAMA (Gr. πᾶν, all, and ὅραμα, view), the name given originally to a pictorial representation of the whole view visible from one point by an observer who in turning round looks successively to all points of the horizon. In an ordinary landscape picture only a small part of the objects visible from one point is included. If a greater part of a landscape has to be represented, it becomes more convenient for the artist to suppose himself surrounded by a cylindrical surface in whose centre he stands, and to project the landscape from this position on the cylinder. In a panorama such a cylinder, originally of about 60 ft., but now extending to upwards of 130 ft. diameter, is covered with an accurate representation in colours of a landscape, so that an observer standing in the centre of the cylinder sees the picture like an actual landscape in nature completely surround him in all directions. This gives an effect of great reality to the picture, which is skilfully aided in various ways. The observer stands on a platform representing, say, the flat roof of a house, and the space between this platform and the picture is covered with real objects which gradually blend into the picture itself. The picture is lighted from above, but a roof is spread over the central platform so that no light but that reflected from the picture reaches the eye. To make this light appear the more brilliant, the passages and staircase which lead the spectator to the platform are kept nearly dark. These panoramas, suggested by a German architectural painter named Breisig, were first executed by Robert Barker, an Edinburgh artist, who exhibited one in Edinburgh in 1788, representing a view of that city. A view of London and views of sea fights and battles of the Napoleonic wars followed. Panoramas gained less favour on the continent of Europe, until, after the Franco-German War, a panorama of the siege of Paris was exhibited in Paris. This panorama, executed by Henri Philippoteoux, French painter, included plastic objects in the foreground which strengthened the optical illusion. Paul Philippoteoux, the son of the above painter, was noted for his "Battle of Gettysburg" (1883) which was exhibited in New York and other American cities, "Plevna" and "Falls of Niagara."

Other distinguished painters of panoramas were Ludwig Braun and Anton von Werner in Germany, and De Neuville and Detaille in France.

The name panorama, or panoramic view, is also given to drawings of views from mountain peaks or other points of view, such as are found in many hotels in the Alps, or, on a smaller scale, in guide-books to Switzerland and other mountainous districts. In photography a panoramic camera is one which enables a wide picture to be taken.

See Bapst, *Essai sur l'histoire des panoramas et dioramas* (Paris, 1891).

PAN-PACIFIC UNION, THE, an international organization which took out its charter in 1917. It is the first of a number of similar organizations born in Hawaii and throughout the Pacific area.

The Union called several small conferences prior to the World War; in 1921 it called and financed the first of the Pan-Pacific science congresses, now the recognized official science body of the Pacific area. It next called and financed in quick succession a Pan-Pacific educational congress, a Pan-Pacific press congress, a Pan-Pacific commercial congress, and a Pan-Pacific food conservation congress. Out of this latter grew a permanent International Sugar Technologists Conference body, a Pan-Pacific Fisheries Association and the Pan-Pacific Research Institution.

The Pan-Pacific Union organized the calling of a Pan-Pacific Y.M.C.A. secretarial congress. Out of this grew the Institute of Pacific Relations. The Pan-Pacific Union has issued or is issuing calls for the following conferences: a Pan-Pacific women's congress, Aug. 1928; a Pan-Pacific surgical congress, Aug. 1929, and a Pan-Pacific medical congress 1930, as well as Pan-Pacific ethical and students conference within the near future, and a second Pan-Pacific commercial congress and a Pan-Pacific botanic conference.

At these conferences points of agreement are sought and plans laid for accomplishing definite projects on which all peoples of the Pacific can agree are for the welfare of the great area which is the home of more than half of the human race. Representatives from Pacific lands only and of the League of Nations are invited to these conferences.

The heads of all Pacific Governments are the honorary heads of the Pan-Pacific Union, which itself is a non-official organization. The operating offices have been established in Honolulu.

In 1908 the Hon. Walter F. Frear, then governor of Hawaii, became president of what later became the Pan-Pacific Union. He was followed by Gov. C. J. McCarthy, president of the Union, then by the Hon. Wallace R. Farrington, as governor of Hawaii. There were in 1928 30 trustees of the Union, who were leading men of Pacific nationalities. In many of the Pacific lands Pan-Pacific Associations have been organized, national in scope, as the Union is international. Under the associations are Pan-Pacific clubs in the various cities; these are local. In Japan, Prince I. Tokugawa heads the association and Viscount T. Inouye the Tokyo Pan-Pacific club which is the open forum for international discussion in Japan. There are other Pan-Pacific clubs in Osaka, Kyoto, etc., and in China, as well as elsewhere in Pacific lands.

The Pan-Pacific Union has as its official organ *The Mid-Pacific Magazine*, an illustrated monthly, and publishes the Bulletin of the Pan-Pacific Union monthly (free) as well as the *Journal* of the Pan-Pacific Research Institution and *Pan-Pacific Youth*. It also publishes in book-form the proceedings of the conferences.

(W. R. F.)

PAN-PIPES: *see* SYRINX.

PANPSYCHISM, a philosophical term applied to any theory of nature which recognizes the existence of a psychical element throughout the objective world (Gr. πᾶν, all; ψυχή, soul). In such theories not only animals and plants but even the smallest particles of matter are regarded as having some rudimentary kind of sensation or "soul" which plays the same part in relation to their objective activities or modifications as the soul does in the case of human beings. Such theories are the modern scientific or semi-scientific counterparts of the primitive animism of savage races, and may be compared with the hylozoism of the Greek physicists. In modern times the chief exponents of panpsychist views are Thomas Carlyle, Fechner and Paulsen: a similar idea lay at the root of the physical theories of the Stoics.

PANSLAVISM. The term Panslavism has had very various interpretations. Roughly it may be summarized as the doctrine that all Slavonic peoples should have as large a measure as possible of political solidarity. The first great Panslavist writer was a Croat Catholic priest, Jurij Križanić (b. 1616), who conceived a remarkably broad and liberal programme of Slavonic political unity, and undertaking the life's task of propagating this idea, was trained in Rome as a missionary to Slavonic countries and spent the major part of his later life in Russia, in the reign of Alexis, father of Peter the Great. Križanić, like many of his successors, emphasized the remarkably close kinship between the Slavonic languages.

Language has been almost the sole link between the Slav peoples, and they only had a common history in the period before the consolidation of political states. Slav political unity had been fatally broken by the invasion of the Danubian Plain by the Magyars at the end of the 9th century, introducing a wedge of Asiatic origin between the East, West and South Slavs, which has lasted till to-day. The Tartar invasion of Russia in the 13th century not only arrested the promising growth of Russian culture, but led indirectly to the loss of the Dnieper water-road, which had been the central nerve of the first Russian State of Kiev. This territory now passed to Lithuania which, by the marriage of its prince, Jagailo (Jagellon), with the heiress to the Polish throne in 1386, fell into the orbit of Polish administration and policy. The Poles had accepted Latin Christianity in the 10th century when the Russians accepted the Orthodox form, and this religious difference, coupled with the passing of so much Russian territory under Catholic rule, led to an interminable series of wars between Poland and Russia lasting up to the final partition of Poland in 1795, and, in different conditions, even to 1814. The Hungarian

invasion and the course of events just enumerated between them made almost impossible the creation of a great Slav empire. On the other hand, several of the most eminent statesmen in Russia and Poland saw the evils of this struggle and the blessings which might result from peaceful co-operation. Of these the most distinguished was Ordyn-Nashchokin, the peculiarly modern minded foreign minister of Tsar Alexis, who was himself greatly taken with the same idea. Križanić belonged to a Slavonic people which, like many other smaller Slav units, had fallen under German domination, and he sought the help and co-operation of Alexis definitely as "the Tsar of his own people" against Germans, Turks and all non-Slavs.

Križanić obtained only a very qualified success in Russia, and in fact left behind him little more than a great political ideal Succeeding Russian sovereigns, such as Peter the Great, Anne, Catherine II, and Alexander I., always had this ideal in view as an instrument of political expansion, and frequently their policy was strongly tinged with it, but in their diplomatic relations with Turkey, Austria and Prussia, there were often compromises which seriously restricted its realization Of these compromises the most important was the joint partition of a Slavonic state, Poland, between Russia, Prussia and Austria, initiated by Frederick the Great, and adopted by Catherine II

In the short period while Russia with an autocratic régime and Poland with a constitutional, were united under one sovereign (1815–30), some Russian statesmen showed a great interest in the cause of Slavonic intellectual reciprocity, the movement towards which was greatly advanced by the philological studies of the Czech Dobrovsky and others relating to the period when the Slavs had a common history.

The Slavophils.—Towards the middle of the 19th century as a reaction against the policy of Peter the Great and the wholesale adoption of Western forms and ideas in Russia, arose a group of Russian thinkers known as Slavophils Slavophilism must be very carefully distinguished from Panslavism In the interpretation of its two principal exponents, A. Homyakov and I. Kireyevsky, it cannot be identified with any programme for the political expansion of Russia Both believed that Western civilization had been permanently thrown out of gear by the break which had occurred in the West with the triumph of humanism in the Italian Renaissance and the rupture brought about by the Reformation Homyakov saw in Russia, as a country which had remained intact from this disturbance, elements which offered the promise of a much more healthy and normal development, and Kireyevsky found in the Orthodox Fathers the elements of a creed in which reason and instinct, instead of being in constant conflict, can freely co-operate to form a complete and harmonious human personality. The Slavophil creed, however, was always very vague, and this helped to facilitate its utilisation for political objects

The doctrine of the Slavophils, which found ardent adherents in the *élite* of Russian educated opinion, might easily be perverted into a creed of Russian expansion. The Russian Government never identified itself wholly with this creed but frequently utilized it Its principal exponent in this limited political sense was M Katkov (b. 1821), for many years the powerful and influential editor of the *Moscow Gazette* (1856–87). Katkov had much of the Slavophil in him, but aimed before all things at being the recognized independent exponent of a specifically Russian political opinion. He safeguarded himself effectively from any charge of subservience to Government policy, which he constantly attacked in the most vigorous way, and more or less successfully took up the position of arbiter of patriotic Russian opinion

Modern Thinkers and Writers.—There were others who went much further, notably the Panslavist writer N Danilevsky (1822–85), who in 1869 published his chief work *Russia and Europe*. Danilevsky took no particular interest in the Slavophils, but considered that every Russian should necessarily be a born Panslavist. The principal public critic of his theory was the philosopher Vladimir Solovyev.

Unquestionably the intrusion of Russian dynastic and state interests into the questions raised by Panslavism, tended in many ways to hinder the realization of its ideals It was impossible for the smaller Slavonic countries outside the Russian empire to have any full confidence in Russia during the long period (1831–1915) in which Russian administration in Poland was based on a policy of extinction of the Polish nationality. Thus Poland's subjection to the Russian empire and her geographical situation as next of the Slavonic peoples to Russia, impeded any movement in favour of Panslavism

After the institution of the Russian Duma, 1905, the Czech statesman Kramař promoted, for a time successfully, a movement of co-operation between Slavonic members of the respective parliaments in which the Slav peoples were represented (1908–11). This so-called Neo-Slavophil movement, which was frankly political and relied on democratic representation, received severe rebuffs in the annexation of Bosnia to Austria (1908), and in the fiasco which, by Austrian intervention, terminated the collaboration of Serbia and Bulgaria in the Balkan wars of 1912.

Consequences of the World War.—The World War completely revolutionized the Slavonic question In the other Slavonic countries Communist propaganda had even less success than elsewhere, and Russia's relative withdrawal into Asia and defiance of the accepted principles followed by other governments put an effective end to any Russian leadership in the matter. Meanwhile, in Russia's default, as far as the other Slavonic countries were concerned, the Slavonic question travelled infinitely nearer to a solution than could ever have been dreamed before, but generally on lines adopted by the Western Powers of the Entente, and in particular on the basis of self-determination, which was the main principle adopted at Versailles in the delimitation of the new frontiers. New national states were constituted with far smaller minority elements than had been the case before. Of these new states the majority were republics. This led to a total revision of Slavonic aspirations, many of which were already practically achieved.

On the other hand Slavophilism in its purer form underwent a remarkable revival The theory of Kireyevsky, which saw in the course of Western European history a bankruptcy of humanism, seemed to some remarkable Russian thinkers, such as Berdiayev and Bulgakov, to receive striking confirmation from the present situation in Russia, and these thinkers, calling attention to the historical fact that Byzantine Caesaro-Papism had ended with the fall of Tsardom, reverted to the first Slavophils in the hope of finding bases for deeper social consciousness for Russia

See A Fischel, *Der Panslavismus bis zum Weltkrieg* (1919; bib; good, clear and generally fair account from standpoint of a political opponent); *The Slavonic Review, passim* especially in 1928.

(B. P.)

PANSY or **HEARTSEASE,** a favourite garden flower, one of the oldest in cultivation, belonging to the violet family (Violaceae) It has been grown for so long a period under such diverse conditions and in such a variety of forms that its origin is uncertain The numerous handsome forms, with their striking variations of size and colour, are purely an artificial production of the gardeners and differ in a marked degree from any related wild plant now known. The pansy is generally supposed to be merely a cultivated form of *Viola tricolor* (*see* VIOLET), a weed of European grain fields, while others assert it to be the result of hybridization between *V tricolor* and other species such as *V. altaica* and *V. grandiflora*

The tufted or bedding pansy, called also horned violet, is a cultivated form of *Viola cornuta,* a native of Spain and the Pyrenees mountains It differs from the true pansy in its tufted habit of growth and in the shape and position of its flower parts. The petals, which are obovate in form, do not overlap as in the true pansy, but stand distinctly apart. The spur on the lower petal, instead of being short and rounded, is long, slender and sharp-pointed, whence the name horned violet. There are numerous garden forms varying greatly in colour, ranging from violet to white

Some recent experiments go to show that seeds of the wild *V. tricolor* will produce forms so like those of the cultivated pansy that it is reasonable to assume that that flower has originated from the wild plant by continuous selection. The changes that have been

effected from the wild type are, however, more striking to the eye than really fundamental—increase in size, an alteration in form, by virtue of which the narrow oblong petals are converted into circular ones, and variations in the intensity and distribution of the colour. The modern varieties of the pansy consist of the show varieties, and the fancy varieties, obtained from Belgium, and now much improved. Show varieties are subdivided according to the colour of the flowers into selfs, white grounds and yellow grounds. The fancy or Belgian pansies have various colours blended, and the petals are blotched, streaked or edged. The bedding varieties, known as violas or tufted pansies, have been raised by crossing the pale-blue *Viola cornuta,* and also *V. lutea,* with the show pansies. They are hardier than the true pansies and are free-blooming sorts marked by effectiveness of colour in the mass.

For details of wild forms, *see* G. Drabble, "The British Pansies," *Journal of Botany* (1909–26–27).

PANTAENUS, head of the catechetical school at Alexandria, *c.* A.D. 180–200, known chiefly as having been the master of Clement, who succeeded him, and of Alexander, bishop of Jerusalem. Clement speaks of him as the "Sicilian bee," but of his birth and death nothing is known. Eusebius and Jerome speak of him as having been, originally at least, a Stoic, and as having been sent, on account of his zeal and learning, as a missionary to "India." There is some reason to think that this means the Malabar coast. Only a few brief reminiscences of his teaching are extant. (*See* Routh, *Rel. sac.* i. 375–383.)

PANTALEONI, MAFFEO (1857–1924), Italian economist and politician, was born at Frascati in 1857. After studying in Germany, he returned to Rome and attended the law faculty of the university where he took his degree. In 1902 he was appointed professor of political economy in the University of Rome, a post which he held until his death. His *Pure Economics* (published in 1889, Eng. trans., 1898) was the first organic treatise in which—in accordance with the teaching of Marshall—the doctrines of the classical writers on value were harmonized with the new utility theory of Gossen and Jevons. Pantaleoni was deputy for Macerata in the XI. Legislature, and at first showed some sympathy for socialism of which he afterwards became an uncompromising opponent. On the outbreak of the World War he was an ardent pro-Entente interventionist. After the Armistice he opposed Bolshevism, and was a warm supporter of the Fascist movement, being one of the first senators created by the Fascist government. In 1923 Pantaleoni was appointed Italian delegate on the League of Nations committee for the restoration of Austria's finances, of which he was president. He died in Milan on Oct. 29, 1924.

Pantaleoni's works include: *Teoria della translazione dei tributi* (1882); *Dell' ammontare probabile della ricchezza in Italia* (1885); *Manuale di economia pura* (1889); *Scritti varii di economia; La caduta del Credito Mobizliare; Note in margine alla guerra, Bolscevismo italiano* and *Erotemi di Economia* (1926).

PANTALOON [Ital. *pantalone*], a character in the old Italian popular comedy, said to represent a Venetian, from the favourite Venetian saint San Pantaleone, and transferred from it to pantomime (*q.v.*). The Italian pantaloon was always a silly old man with spectacles and wearing slippers, and his character was maintained in pantomime and has also made his name a synonym for a tottering dotard, as in Shakespeare's *As You Like It* (II. vii. 158). From the Venetian usage the word "pantaloon" (whence "pants") has also been given to certain forms of garment for the legs, the exact meaning varying at different times.

PANTELLERIA, an island in the Mediterranean (ancient *Cossyra*), 62 m. S. by W. of the south-western extremity of Sicily, and 44 m. E. of the African coast, belonging to the Sicilian province of Trapani. Pop. (1921), 9,051. It is entirely of volcanic origin, and about 45 sq.m. in area; the highest point, an extinct crater, is 2,743 ft. above sea-level. Hot mineral springs and ebullitions of steam still testify to the presence of volcanic activity. The island is fertile, but lacks fresh water. The principal town (pop. 6,874) is on the north-west, upon the sole harbour (fit only for small steamers), which is fortified. There is also a penal colony here. Sweet wine and raisins are exported.

On the west coast, 2 m. south-east of the harbour, a neolithic village was situated, with a rampart of small blocks of obsidian, upon the east: within it remains of huts were found, with pottery, tools of obsidian, etc. To the south-east are tombs, known as *sesi*, similar to the *nuraghi* of Sardinia, consisting of round or elliptical towers with sepulchral chambers in them, built of rough blocks of lava. Fifty-seven of them can still be traced. The largest is an ellipse of about 60 by 66 ft., but most of the *sesi* have a diameter of 20–25 ft. only. After a considerable interval, during which the island probably remained uninhabited, the Carthaginians took possession of it, occupying as their acropolis the twin hill of San Marco and Sta. Teresa, 1 m. south of the town of Pantelleria.

The Romans occupied the island in 255 B.C., lost it again the next year, and recovered it in 217 B.C. Under the Empire it served as a place of banishment for prominent persons and members of the imperial family. About 700 the Christian population was annihilated by the Arabs, from whom the island was taken in 1123 by Roger of Sicily. In 1311 a Spanish fleet, under the command of Requesens, won a considerable victory here, and his family became princes of Pantelleria until 1553, when the town was sacked by the Turks.

See Orsi, "Pantelleria" (in *Monumenti dei Lincei* 1899, ix. 193–284).
(T. A.)

PANTHEISM (Gr. πᾶν, neut. of πᾶς, all, every, θεός, God) and its kindred terms are of modern origin. Toland, in 1705, described himself as a Pantheist, and it is commonly said that the word had not been used before. Johnson defines a Pantheist as "one who confounds God with the Universe: a name given to the followers of Spinoza." But once coined, the terms were found convenient to describe much older systems. Thus we find one system called pantheistic because it treats God as "first in rank and not in time," and so implicitly denies creation; another system because it believes, not in "individual substantial souls, but instead in one universal vital sensitive force"; another because it conceives God as "permeating the world like an all-pervading breath" and the human soul as "part of the Deity"; another because instead of creation out of nothing it affirms an infinite eternal substance which rouses itself into action and clothes itself in a multiplicity of forms—forms which in the aggregate make up the Universe and in the end return into the Inscrutable Oneness from whence they came forth.

The use of the term is further illustrated: (1) By the saying of Ritschl that "if we obliterate the limit between God and the world, and thus prefer the pantheistic to the Christian conception, we ignore the Christian principle which treats the individual man as of higher worth than the whole world" (*Rechtfertigung und Versöhnung*, iii. p. 201); (2) by the Roman Catholic argument that Pantheism implies a conception of "emanation from God," or of "evolution in God," which is contrary to His nature (Tanqueray, *Syn. Theol. Dog.*, ii. 423); (3) by the well-known saying of Schopenhauer that a Pantheism which "explains every phenomenon as a theophany" must "also be applied to the most terrible and abominable phenomena."

Definitions.—If, then, we seek for definitions of Pantheism we shall find them variously given. A system may be called pantheistic if it sets value upon the unity of the world, without insisting upon ultimate distinctness of personality either in God or man; if it teaches a single immanent principle—a "life-force" or what not—in such a way as to diminish the importance or independence of individuals; if without a doctrine of creation, it recognizes God as working in natural law generally, or even in any single department of reality. "Where Love is, there God is"; "It is God that mortal should help mortal"; "God is the moral order of the Universe"—even "God is the moral and redemptive order of the world which Christ revealed"—might from some points of view be regarded as pantheistic sentiments.

Thus we must recognize different forms of pantheistic theory. "For Pantheism," it has been said, "God is immanent in the Universe of finite things." In the more popular or easy-going form of it, which has received classical expression in the famous passage of Pope ("Warms in the sun, refreshes in the breeze," etc.), God is a pervading presence. In the profounder forms of

it, as in Spinoza, everything is a fragment or mode of God, is unreal or only relatively real apart from God and finds its reality in God (S. Alexander, *Space, Time and Deity,* ii. 389). No one, it is sometimes said, "should be called a Pantheist unless he regards everything as *equally* a manifestation of God." Such Pantheism is in extreme opposition to Hegelianism—itself sometimes labelled "pantheistic" (Tanqueray, *S.T.D.*, i. 79)—for which appearances are on different and graded levels

Religious Objections.—The common religious objections to Pantheism are based on the fear that it must obliterate moral distinctions; or that it must destroy faith in a God with whom man can hold converse. Yet religion has an obvious interest in the unity which Pantheism affirms. Faith implies that in the Universe at large (through evil overcome) the good is realized in its entirety. On no other basis is complete religious trust possible. For faith, therefore, God cannot be less than the Whole. A God not inclusive of all good is less than perfect. If God, all-inclusive of good, is not also the all-inclusive reality, the Universe is not the realization of the good. A consummate work of any kind is injured as much by addition as by diminution. The objections to Dante's theory that God's self-revelation must leave behind it an "infinite excess of unrevealed good" (*Parad.,* xix. 45) are clear from the context (67–78). God, then, must be thus conceived as just the Good in its full realization. He is not merely an omniscient Being. He must also include all the truth and reality which He knows. He is not merely a Cause whose effect is outside itself. The Christian conception of mankind as within God "in whom all things hold together" (Col. i. 17) is itself a species of Pantheism. The chief problem that remains is to reconcile this all-inclusive unity with the distinction of good from evil and of God from men. (C. J. Sh.)

Philosophy.—In philosophy and theology, pantheism is the theory that "God is all, and all is God." The Universe is not a creation distinct from God, nor merely a part of God; neither is God outside the universe, or transcendental, nor is He merely a part, or an immanent aspect, of the universe. God is the Universe, and the Universe is God. Finite minds and finite things, all the objects of ordinary human experience are only modes, modifications, or fragments of God, who is so much more than any of them or the mere sum of all of them. Such, briefly, is the meaning of Pantheism. It must be remembered, however, that Pantheism is not merely an abstract theory, but a total attitude, a religion, and the attitude may be there in the form of a religious sentiment, or in the form of a poet's feeling for Nature, and yet may not attain to anything so articulate as an explicit, reasoned philosophy. It is likely enough that with most of the pantheists past and present pantheism has been little more than a vague intuition and an inarticulate mood.

The classical exponent of the philosophy of pantheism was Spinoza. But pantheism is very old and international. It is found in ancient India, perhaps 1000 B.C., in the identification of *Brahman* with the universe. In Egypt also it is met with quite early in the successive identifications of *Ra, Isis* and *Osiris,* with everything that exists. According to Plutarch the temple of *Isis* bore the inscription: "I am all that hath been, is, or shall be; and no mortal has lifted my veil." Among the Greeks there were pantheistic philosophers from the 6th century B.C. onwards. The best known of them are Xenophanes, Parmenides, Heraclitus, and Cleanthes the Stoic, whose hymn to Zeus is one of the beauties of pantheistic poetry. During the Middle Ages a pantheistic strain is observable in Neoplatonism, and in some representatives of all the historic religions. Christianity is represented by John Scotus Erigena (9th century) and David of Dinant (12th century) among others. Islam had its great pantheist in Averroes, or Ibn Roschd (12th century). Judaism had its pantheistic Kabbalists. The Revival of Learning during the 14th, 15th and 16th centuries brought with it a more sympathetic attitude towards Nature, more like that of the Greeks and of the Hebrew nature poets than that which had found expression in the familiar quotation which linked together "the world, the flesh and the devil." The most famous of the pantheists of this period of the Renaissance was Giordano Bruno, who perished at the stake in 1600, by order of the Inquisition. There followed Spinoza, and later John Toland, the first to introduce the term "pantheist," in 1705. Until near the end of the 18th century there was little inducement to profess pantheism even if one embraced it. "Pantheism" was used as a synonym of "atheism" and applied as a term of abuse. But from then on one meets with renowned names in the chronicles of pantheism—the poets Lessing and Goethe, the philosophers Fichte, Schelling and Hegel, and even Christian theologians like Schleiermacher and Strauss.

The question of "personality" has always been one of the chief objections urged by opponents of pantheism. And that in two ways. On the one hand, the idea of a God who is not personal, towards whom they cannot feel as children towards their Father, leaves them rather cold and disconsolate. On the other hand, they cannot relish the thought that human beings are not permanent or eternal personalities. On both these points, omitting altogether the more childish and cruder forms of the claims implied in these objections, there has been much misunderstanding. What pantheism really objects to is the conception of God as though He were a big man. Human personality is largely the result of limitations and deficiencies such as cannot be attributed to the Infinite. There must be something as infinitely superior to human personality as human personality is superior to the unity of a grain of sand. If one insists on speaking of divine "personality" this must be conceived as differently from human personality "as the heavens are high above the earth." And then the term really loses its ordinary meaning, as Spinoza insisted in another connection. What alarms some people is probably the assumption that to say that God is not "personal" is to say that He is less than that; but that, of course, is an absurd misinterpretation of a view which insists on the incomparable superiority of the infinite to the finite. With regard to the second point, the anxiety to be reassured about human immortality or the perpetuation of human personality, on this point, too, there has been much misunderstanding. Pantheism, it is true, does not exactly encourage anything like a belief in personal resurrection. But it does leave room for the kind of immortality which can be accepted or desired by people who think and are not vain.

Goethe in his poem "One and All" expressed the thought that to lose oneself in the Infinite is *the* way to find oneself. Many lesser men have felt that to identify oneself with some great cause is the worthiest kind of immortality. And, on the other hand, some of those who have achieved most have readily attributed the credit for their achievements to a greater power working through them.

As Spinoza was the great philosopher of pantheism so Goethe was its great poet. Strains more or less pantheistic may, of course, be found in all the great nature poets from some of the Psalmists to Wordsworth, just as a more or less pantheistic mood is to be found in many of the religious mystics. But Goethe's pantheism was partly at least the fruit of a close study of Spinoza's philosophy. It was both "Truth and Poetry" with him. The great systems of philosophy are all akin to great poetic creations. Plato already described philosophy as the highest kind of poetry. This is perhaps especially true of pantheistic philosophy. And what the student of pantheistic philosophy needs above all is "a heart that understands." In this respect the poetry of Wordsworth and, even more so, that of Goethe may be found most helpful and illuminating, at least as an introduction to the proper study of pantheism as a rational philosophy.

See METAPHYSICS, MONISM, SPINOZA, and the articles on the other subjects and persons named.

PANTHEON, a building for the worship of all the gods revered in a certain locality; hence a building where many famous men are buried, or a structure built to commemorate a number of national heroes. The most famous example of this usage is that of the pantheon at Regensburg, sometimes known as the Valhalla, erected by Ludwig I. of Bavaria, in memory of German heroes.

More specifically, pantheon is the name of two famous buildings, one in Rome and one in Paris. The Roman pantheon was

begun by Agrippa in 27 B.C., probably as a rectangular building of ordinary temple type. It was completely rebuilt by Hadrian, in its present circular form (110–125), the columns of the present front porch being probably those of the earlier building. Under Septimus Severus repairs and alterations were made; it is likely that at this time the rectangular coffers were cut on the inside face of the dome. The Roman pantheon is remarkable, not only for its size, the dome being 144 ft. in diameter, and for its elaborate brick construction, but also for its perfect preservation and the fact that for almost 2,000 years it has served continuously as a place of worship, having been dedicated in A.D. 609 as the church of S. Maria Rotunda. The gilt bronze tiles that once covered the dome were stripped off and carried to Constantinople at an early date, and in the 17th century the bronze trusses and girders which carried the portico roof were melted and used to make Bernini's baldachino in S. Peter's at Rome. The present stucco panels and pilasters that circle the interior above the order cornice and below the spring of the dome are of late Renaissance date, and the bronze rosettes and mouldings that once decorated the coffers have disappeared. Otherwise, the interior of the building exists in its exquisite original form.

The pantheon at Paris was begun in 1764 by Soufflot as the church of S. Genevieve. This was secularized under the Revolution and then received its present name—*panthéon*. It served as a church, also, from 1828–30 and from 1851–70. The panthéon at Paris bears little resemblance to the Roman example. It is a cruciform building with a high triple dome over the crossing and the four arms vaulted with lower saucer domes on pendentives.

PANTHER, another name for the leopard (*q.v.*), also used in America as the name of the puma (*q.v.*). The panther was formerly supposed to be a distinct animal from the *pardus*, pard, the leopard. In modern times a distinction had been unscientifically drawn between a larger type of leopard to which the name panther was given, and a smaller and more graceful specimen.

PANTIN, a suburb 6 kilometres north-east of Notre Dame de Paris in the department of Seine, on the Canal d'Ourcq. Pop. (1926) 39,080. It manufactures boilers, wagons, machinery, pianos, oil, glass, chemicals, chocolates, polish, perfumery and tobacco. There are also dye-works, foundries and distilleries.

PANTOGRAPH: *see* MATHEMATICAL INSTRUMENTS; LINKAGES.

PANTOMIME, the representation of emotions, action and various situations entirely by body movement, gesture and steps. It occurs in all primitive stages of civilization, expressing itself in war-dances, animal mimicry and sacrificial rites, and in Indian and Egyptian civilization it had already developed artistic forms. The Greeks sometimes employed choruses to accompany their pantomimes. The Romans, especially, cultivated pantomime, and in the time of the empire they even had a special school for its development. They distinguished the various characters in the pantomime by means of masks. They also employed scenic effects, resulting in dramatic action presented in the manner of the theatre. In Roman usage the term was applied both to the actor of this kind of play and to the play itself; less logically, we also use the term to signify the method of the actor when confined to gesticulation. Historically speaking, so far as the Western drama is concerned there is no intrinsic difference between the Roman *pantomimus* and the modern "ballet of action," except that the latter is accompanied by instrumental music only, and that the personages appearing in it are not usually masked. The English "dumb-show," though fulfilling a special purpose of its own, was likewise in the true sense of the word pantomimic. The modern pantomime, as the word is still used, more especially in connection with the English stage, signifies a dramatic entertainment in which the action is carried on with the help of spectacle, music and dancing, and in which the performance of that action or of its adjuncts is conducted by certain conventional characters, originally derived from Italian "masked comedy."

Later Development.—The religious mystery plays of the middle ages again show traces of the old pantomime—as a later development came the *commedia dell' arte* (*q.v.*) introducing the popular figures of Harlequin (*q.v.*), the clown, Truffaldino, etc.—in which song and dance alternated with improvised jests. Plays of this nature written round the traditional *Hanswurst* enjoyed the greatest popularity in Germany and especially in Vienna, until well into the 19th century.

In Germany, where the term pantomime was not used, a rude form of dramatic buffoonery, corresponding to the coarser sides of the modern English species so-called, long flourished, and threw back for centuries the progress of the regular drama. The banishment of *Hanswurst* from the German stage was formally proclaimed by the famous actress Caroline Neuber at Leipzig in a play composed for the purpose in 1737. After being at last suppressed, it found a commendable substitute in the modern *Zauberposse*, the more genial Vienna counterpart of the Paris *féerie* and the modern English extravaganza.

About 1723, this type of entertainment gained a firm footing in England, where the harlequinade, *Dr. Faustus*, was given at Drury Lane, and was followed by many similar plays. Besides, this pantomime form, consisting solely of a series of dances with musical accompaniment, continued to hold its own. These were known as "ballets" or ballet (*q.v.*) and reached their highest development under Jean Georges Noverre (*q.v.*) who, in the 18th century, introduced the same reforms into the art of dancing which C. W. Gluck had introduced into music. He composed elaborate dance-dramas, in which wide use was made of emotional situations. He attempted to restore pantomime proper to the stage as an independent species, by treating mythological subjects seriously in artificial ballets. This attempt, which of course could not prove permanently successful, met in England also with great applause. Noverre's pantomime or ballet *Cupid and Psyche* is commended as of very extraordinary merit in the choice and execution of the subject. It seems to have been without words. The writer of the tract states that "very lately the serious pantomime has made a new advance in this country, and has gained establishment in an English theatre"; but he leaves it an open question whether the grand ballet of *Medea and Jason* (apparently produced a few years earlier, for a burlesque on the subject came out in 1781) was the first complete performance of the kind produced in England. He also notes *The Death of Captain Cook*, adapted from the Parisian stage, as possessing considerable dramatic merit, and exhibiting "a pleasing picture of savage customs and manners."

Recent Revival.—In the 19th century the pantomime very nearly disappeared from the stage owing to the decline in the art of the ballet. It is gratifying to observe that the "new dance" which is being developed mainly in Germany, under the leadership of Rudolf von Laban and Mary Wigman, has revived the art of the pantomime. The new dance-drama (*neue Tanzbühne*) founded and directed by Hanns Niedecken-Gebhard has as its main object the cultivation of pantomime in opera. Under the choreographic direction of Kurt Joss and Jens Keith, it has produced the fantasy *Die Brautfahrt* and the *Tanztragödie* and applied Mozart's music for Noverre's *Les Petits Riens* to a new form of ballet production. At the Berlin opera house the ballet master, Max Terpis, has produced a series of pantomimes on a more important scale. The work at Hanover of the ballet master, Mme. Yvonne Georgi, deserves special notice; in collaboration with Harald Kreutzberg, she has produced remarkable dances which consciously combine stage-craft and the medium of expression provided by the art of the modern theatre. The ballets by Diaghileff, with their combination of the old art of the ballet and the new expressionist dance, are also striking representations of the real pantomime dance.

London, 1800), especially vol. ii., iv. and v.; *Apology for the Life of Colley Cibber*, ed. R. W. Lowe (2 vol. London, 1889); P. Fitzgerald, *Life of Garrick* (2 vol. London, 1868); R. J. Broadbent, *A History of Pantomime* (1901); O. Bie, *Der Tanz* (1905); H. Niedecken, *Jean Georges Noverre, Sein Leben und seine;* A. Levinson, *J. G. Noverre, Lettres sur la danse* (1927). (H. Kr.)

PANTOPODA, an alternative name for the Pycnogonida (*q.v.*), an aberrant group of arthropods, perhaps related to the Arachnida (*q.v.*).

PANTUN, a quatrain in Malay literature, generally a riddle or puzzle-verse where the third and fourth lines pose a problem or carry a surprise. The first and third and the second and fourth lines rhyme, but there is often a species of alliteration accompanied by internal rhymes. The *pantun* is used almost as a proverb.

In imitation of the Malay quatrain, Victor Hugo, in *Les Orientales* (1829), used the *pantoum* and set a fashion which was followed by Théodore de Banville and Leconte de Lisle. In English the best example of *pantoum* is Austin Dobson's *In Town*

See R. J. Wilkinson and R O. Winstedt *Pantun Melayu* (1914); O. T. Dussek, *Teka-Teki* (1918).

PAN-TURANIANISM. In the Persian epic *Turan* means the steppes and deserts of Central Asia, in contrast to the cultivated country of *Iran* or Persia. The people of Turan were the nomads who had constantly overrun Persia from the north-east, and who belonged linguistically to the peoples speaking the so-called agglutinative languages The word Turanian was coined by modern European philologists to cover this agglutinative group

Turanian researches were first taken up seriously by the Magyars of Hungary, and this for two reasons. The first reason was that the Magyar language belongs to the Ugro-Finnic branch of the agglutinative group The second motive was political. During the half-century before the World War, the Hungarian statesmen were on the look-out for allies against the Pan-Slav movement, and seized on the fact that Turkish also was a Turanian language (though of a different branch from Hungarian), in order to commend to the Turks the idea of a Magyar-Turkish entente against the Slavs, a supposed linguistic kinship being assumed to imply a common racial origin The Turks however translated Pan-Turanianism into Pan-Turkism, that is, into the narrower idea of a brotherhood between all peoples speaking Turkish dialects, with an insistence upon the aboriginal Turkish element in their own Osmanli language and culture. But the Ottoman Turks felt vividly their solidarity with the whole Muslim world. Thus the leaders of the Committee of Union and Progress always tried to run Pan-Islamism and Pan-Turkism in double harness. It is only since the rise of a new Turkish national movement in 1919 that the Turks have consciously and completely abandoned the Islamic basis of the Turkish state, and have constructed a Turkish republic on exclusively national foundations. Meanwhile, Mustafa Kemal Pasha and his party have thrown over the other side of the original movement, which insisted not merely upon Turkifying the Ottoman state, but on re-creating the links between the Ottoman Turks and other Turkish peoples

It is worthy of note, that the 15,000,000 or 16,000,000 Turks of the Union of Socialist Soviet Republics have been given a far-reaching political autonomy within the framework of the Union, which they never enjoyed under the Tsardom. Of the six republics constituting the Union two, namely the Turkmen and the Uzbeg Republic, are Turkish. Again, one of the three members of the Trans-Caucasian Republic (which itself is a member of the Union) is the Turkish Republic of Azerbaijan. Finally, within the Russian Socialist Federal Soviet Republic, which is the leading member of the Soviet Union, there are a number of autonomous Turkish units, such as the Tatar Republic, the Bashkir Republic. the Kirghiz Republic, the Karakalpak autonomous district, and several other less important territories like the Yakutsk Republic in the far north-east of Siberia.

PANYASIS (more correctly, Panyassis), of Halicarnassus, Greek epic poet, uncle or cousin of Herodotus, flourished about 470 B.C. He was put to death by the tyrant Lygdamis (*c.* 454). His chief poems were the *Heracleias* in 14 books, describing the adventures of Heracles in various parts of the world, and the *Ionica* in elegiacs, giving an account of the founding and settlement of the Ionic colonies in Asia Minor. Although not much esteemed in his own time, some later critics assigned him the next place to Homer (*see* Quintilian, *Inst orat* x. i. 54).

Fragments in G., Kinkel, *Epic poet. fragmenta* (1877), ed separately by J P. Tzschirner (1842); F P Funcke, *De Panyasidis vita* (1837); R Krausse, *De Panyasside* (1891).

PAOLI, CESARE (1840–1902), Italian historian and palaeographer, son of senator Baldassare Paoli, was born and educated in Florence In 1874 he was appointed first professor of palaeography and diplomatics at the Istituto di Studii Superiori in Florence, where he continued to work at the interpretation of mss. In 1887 he became editor of the *Archivio storico italiano*

See C. Lupi, "Cesare Paoli," in the *Archivio storico italiano,* vol. xxix. (1902), with a complete list of his works.

PAOLI, PASQUALE (1725–1807), Corsican general and patriot, was born at Stretta in the parish of Rostino He was the son of Giacinto Paoli, who had led the Corsican rebels against Genoese tyranny. Pasquale followed his father into exile, studied at Naples under the reformer Genovese, and entered the Neapolitan army, serving with distinction as a cavalry officer; on his return to Corsica in 1755, he was chosen commander-in-chief of the rebellion against Genoese rule. After a series of brilliant actions he drove the Genoese from the whole island except a few coast towns From 1757 to 1768 he was the head of the Corsican Government; he completely reorganized the administration, introduced many useful reforms and founded a university at Corte In 1764 Genoa concluded a treaty with France, whereby 3,000 French soldiers were sent to assist the Genoese to hold the fortresses, but only for defensive purposes. Paoli continued the struggle, wrested the island of Capraia from the Genoese and captured the towns where there were no French troops, as the Corsican revolutionaries did not consider themselves at war with France But in May 1768 Genoa, despairing of ever being able to subjugate the island, sold it to France, and the French forces in the island were at once greatly increased Paoli now fought against the French, whom he defeated in many hard-fought battles But with the further increase of the French forces the Corsican resistance gradually broke down, until in May 1769 Paoli had to abandon Corte, the capital, and to take refuge in England During his sojourn in London he enjoyed wide popularity, and was the friend of many celebrities, including Dr. Johnson On the outbreak of the French Revolution the Government allowed the Corsican exiles to return, and after visiting Paris, Paoli landed at Bastia in Jan 1791, with the rank of lieutenant-general and governor of Corsica He resumed his work of reform and development, enjoying wide popularity, and when the republic replaced the monarchy in France he was confirmed in his appointment But he had enemies in Corsica itself, who accused him of reactionary sentiments and of responsibility for the defeat of the French expedition to Sardinia He was deprived of his command by the Convention, and a commission was sent to the island to hold an enquiry on his conduct. The commissioners set up a government of their own, side by side with that of Paoli, who was supported by the majority of the islanders. Anarchy ensued, and in July 1793, Paoli was outlawed A civil war broke out between Paoli and his followers, assisted by British forces, and the Republicans, assisted by the French The latter were finally defeated and the French forced to surrender; a *consulta* at Corte decided to place the island under British protection and drew up a constitution, and although Paoli was not too favourable to the British protectorate, he ended by accepting it The British Government, instead of appointing Paoli viceroy, as had been expected, appointed Gen Sir Gilbert Elliot, who relied upon another Corsican, Pozzo di Borgo, rather than on Paoli, and eventually got Paoli out of Corsica by having him summoned to London, where he went in 1795 This created a good deal of ill feeling, and rebellions broke out all over the island;

the movement received support from the French, and the British were driven out. Paoli again had a very cordial reception in London and was awarded a pension from the British Government. He died in London on Feb. 5, 1807.

PAOLO VERONESE (1528–1588), the name given to Paolo Caliari or Cagliari, Italian painter of the Veronese and Venetian schools, who was born in Verona in 1528. His father, Gabriele Caliari, was one of a family of stone-carvers come to Verona from Bissone on the Lake of Lugano. Paolo was at first trained as a stone-carver, but soon took to painting. He worked under Antonio Badile, a painter of small ability who cannot have helped him much. Vasari states that Paolo then became the pupil of Giovanni Caroto, a distinguished architect and archaeologist as well as a painter, but there seems to be no stylistic connection between them. Other Veronese artists such as Domenico Brusasorci and the Farinati probably influenced his development. "The Holy Family and St. John," in the Cannon collection at Fiesole, is an example of his early style. It is essentially Veronese, simple, solid, sincere; the inimitable brilliance of the flesh tones and the space arrangement presage the later and more accomplished work of his Venetian period. In the spring of 1552 Cardinal Ercole Gonzaga commissioned Paolo and three other Veronese painters, Battista del Moro, Paolo Farinato, and Domenico Brusasorci to paint a series of altarpieces for the cathedral at Mantua. Paolo's altarpiece, "The Temptation of St. Anthony," has recently been identified with a picture in the museum at Caen. At this early period he also worked in several country places with his fellow townsman, Battista Zelotti, on large decorations of churches and palaces. Some of this work is still to be seen in the church of Castelfranco. The frescoes of ladies standing behind a balustrade in the Villa Giacomelli at Maser, though much restored, are good examples of this decorative type of work. In 1555 we find Paolo settled in Venice, but it is now thought that he worked in Venice even before that date, and that he executed the paintings for the Sala del Consiglio dei Dieci with "Jupiter Thrusting Thunderbolts" (Louvre) about the year 1554. Among his earliest work in Venice are the paintings in the sacristy and the church of S. Sebastian, where an uncle of his was prior of the monastery. In 1556 he was asked to paint three tondi with allegorical subjects for the library of St. Mark's. Six other painters were employed on similar tasks, but Paolo's work was generally recognized as the best, and he was tendered a golden chain as an honorary distinction. It is doubtful whether Paolo ever visited Rome. Ridolfi states that he went there in the company of Girolamo Grimani, the Venetian ambassador, whose journey took place about 1560. On June 6, 1562, he received the commission for "The Marriage at Cana" for the refectory of S. Giorgio in Venice. This gigantic and stupendous picture, containing some hundred figures and heads, several of them portraits, was completed in 1563. It was one of the treasures taken to France by the armies of the Revolution, and it was placed in the Salon Carré in the Louvre, where it remains; its great size and the difficulty of moving it served as an excuse for retaining it, when, in 1815, other pictures had to be returned. In 1566 Paolo went to Verona, where he had a commission to paint in his own parish church, and there married the daughter of his former master, Badile. In 1573 he painted another great banquet scene—"The Feast of Levi"—for the refectory of S. Giovani e Paolo in Venice—but he had to appear before the tribunal of the Inquisition to explain that the dwarfs and fools and other figures introduced for decorative effect meant no disparagement to religion. In 1575 he painted "The Martyrdom of St. Giustina" at Padua. Meanwhile, fires had destroyed several rooms in the doge's palace and Paolo was called in to make good the damage. In the Sala del Collegio he painted the "Commemoration of the Battle of Lepanto." For the rich ceiling designed by Ant. del Ponte he painted a "Glorification of Venice," and for the ceiling of the Sala del Gran Consiglio he painted the "Triumph of Venice."

The qualities that strike one in Paolo's works are their splendour and spaciousness. He was eminent as a decorator of large architectural spaces, and supreme in representing numerous figures in a luminous and diffused atmosphere, while in richness of contemporary costumes he surpassed all other Venetians. The colour effects are orchestral in richness and variety; and his silvery tone, obtained by the juxtaposition of warm and cold hues, is essentially Veronese, and differentiates his best works from the golden lustre of Titian. Paolo Veronese died in Venice on April 19, 1588. He was buried in the church of S. Sebastiano and his bust, by Camillo Bozzetti, was placed over his grave by his brother and his sons. In his workshops in Venice he employed many assistants, among whom were his relatives, notably his brother Benedetto (1538–1598), his nephew Alvise Benfatto (1544–1609), and his two sons Gabriele (1568–1631), and Carlo, known as Carletto (1570–1596). Certain pictures executed after Paolo's death, those for instance in the doge's palace, are signed Heredes Paoli.

It is impossible to enumerate all the great works of this prolific master. Among his most celebrated works are: "The Family of Darius at the Feet of Alexander," in which the principal figures are portraits of the Pisani family—in the National Gallery, London. Here the master displays his great gift of portraiture, and his gift of combining in groups the members of some patrician family as taking part in some historical event. The Dresden gallery has some fine examples: "The Madonna of the Cuccina Family," the "Adoration of the Magi" and "The Marriage at Cana." In the Louvre is the "Feast in the House of Simon the Pharisee," painted for the Servites in Venice (1570–78); the Venetian academy has some of the finest works of the master: "The Marriage of St. Catherine," painted for the church of St. Caterina, and "Ceres and Venice," a ceiling painting from the doge's palace, besides the "Feast in the House of Levi."

(I. A. R.)

PAOTOU. The present terminus of the Chinese Government railway (Peking-Suiyuan railway) west of Peking. It stands near the Hoangho, at some distance before the river bends southward between the Ordos plateau and Shansi. It is an important trading and distributing centre for Mongolian products.

PAPACY, the name most commonly applied to the office and position of the bishop or pope of Rome, in respect both of the ecclesiastical and temporal authority claimed by him, *i.e.,* as successor of St. Peter and Vicar of Christ, over the Catholic Church, and as sovereign of the former papal states. The word is formed from Lat. *papa,* pope, on the analogy of "abbacy." The present article is a general history in outline of the papacy itself. Special periods or aspects are dealt with in fuller detail elsewhere, *e.g.,* in the biographical notices of the various popes, or in such articles as CHURCH HISTORY; ROMAN CATHOLIC CHURCH; INVESTITURES; CANON LAW; ECCLESIASTICAL JURISDICTION; ULTRAMONTANISM, etc.

I. FROM THE ORIGINS TO 1087

Primitive Roman Church.—The Christian community at Rome, founded, apparently, in the time of the emperor Claudius (41–54), at once assumed great importance, as is clearly attested by the Epistle to the Romans (58). It received later the visit of Paul while a prisoner, and, according to a tradition which is now but little disputed, that of the apostle Peter. Peter died there, in 64, without doubt, among the Christians whom Nero had put to death as guilty of the burning of Rome. Paul's career was also terminated at Rome by martyrdom. Other places had been honoured by the presence and preaching of these great leaders of new-born Christianity; but it is at Rome that they had borne witness to the gospel by the shedding of their blood;

there they were buried, and their tombs were known and honoured. These facts rendered the Roman Church in the highest degree sacred. About the time that Peter and Paul died in Rome the primitive centre of Christianity—that is to say, Jerusalem—was disappearing amidst the disaster of the war of the Roman empire with the Jews. Moreover, the Church of Jerusalem, narrowed by Jewish Christian particularism, was hardly qualified to remain the metropolis of Christianity, which was gradually gaining ground in the Graeco-Roman world. The true centre of this world was the capital of the empire; the transference was consequently accepted as natural at an early date. The idea that the Roman Church is at the head of the other Churches, and has towards them certain duties consequent on this position, is expressed in various ways, with more or less clearness, in writings such as those of Clemens Romanus, Ignatius of Antioch and Hermas. In the 2nd century all Christendom flocked to Rome; there was a constant stream of people—bishops from distant parts, apologists or heresiarchs. All that was done or taught in Rome was immediately echoed through all the other Churches; Irenaeus and Tertullian constantly lay stress upon the tradition of the Roman Church, which in those very early days was almost without rivals, save in Asia, where there were a number of flourishing churches, also apostolic in origin, forming a compact group and conscious of their dignity. The great reception given to Polycarp on his visit to Rome in A.D. 155 and the attitude of St. Irenaeus show that on the whole the traditions of Rome and of Asia harmonized quite well. They came into conflict, however (*c.* A.D. 190), on the question of the celebration of the festival of Easter. The bishop of Rome, Victor, desired his colleagues in the various parts of the Empire to form themselves into councils to inquire into this matter. The invitation was accepted by all; and, the consultation resulting in favour of the Roman usage, Victor thought fit to exclude the recalcitrant Churches of Asia from the Catholic communion. His conduct in this dispute, though its severity may have been open to criticism[1] indicates a very definite conception on his part of his authority over the universal Church. In the 3rd century the same position was maintained, and the heads of the Roman Church continued to speak with the greatest authority. We find cases of their intervention in the ecclesiastical affairs of Alexandria, of the East, of Africa, Gaul and Spain. Though the manner in which they wielded their authority sometimes meets with criticism (Irenaeus, Cyprian, Firmilianus), the principle of it is never questioned. However, as time went on, certain Churches became powerful centres of Christianity, and even when they did not come into conflict with her, their very existence tended to diminish the prestige of the Roman Church.

Centrifugal Forces in the Catholic Church.—After the period of the persecutions had passed by, the great ecclesiastical capitals Carthage, Alexandria, Antioch and Constantinople, as secondary centres of organization and administration, drew to themselves and kept in their hands a share in ecclesiastical affairs. It was only under quite exceptional circumstances that any need was felt for oecumenical decisions. Further, the direction of affairs, both ordinary and extraordinary, tended to pass from the bishops to the state, which was now christianized. The Eastern Church had soon *de facto* as its head the Eastern emperors. Henceforth it receded more and more from the influence of the Roman Church, and this centrifugal movement was greatly helped by the fact that the Roman Church, having ceased to know the Greek language, found herself practically excluded from the world of Greek Christianity.

In the West also centrifugal forces made themselves felt. After Cyprian the African episcopate, in proportion as it perfected its organization, seemed to feel less and less the need for close relations with the apostolic see. In the 4th century the Donatist party was in open schism; the orthodox party had the upper hand in the time of Aurelius and Augustine; the regular meeting of the councils further increased the corporate cohesion of the African episcopal body. From them sprang a code of ecclesiastical laws and a whole judicial organization. With this organization, under the popes Zosimus, Boniface and Celestine the Roman Church came into conflict on somewhat trivial grounds, and was, on the whole, being worsted in the struggle, when the Vandal invasion of Africa took place, and for nearly a century to come the Catholic communities were subjected to very hard treatment.

During the 4th century it is to be noticed that, generally speaking, the Roman Church played a comparatively insignificant part in the West. From the time of popes Damasus and Siricius various affairs were referred to Rome from Africa, Spain or Gaul. The popes were asked to give decisions, and in answer to those demands drew up their first decretals. However, side by side with the Roman see was that of Milan, which was also the capital of the Western empire. From time to time it seemed as if Milan would become to Rome what Constantinople was to Alexandria. However, any danger that menaced the prestige of Rome disappeared when the emperor Honorius removed the imperial residence to Ravenna, and still more so when the Western emperors were replaced in the north of Italy by barbarian sovereigns, who were Arians.

In Spain, Gaul, Brittany and the provinces of the Danube, similar political changes took place. When orthodox Christianity had gained the upper hand beyond the Alps and the Pyrenees, the episcopate of those countries grouped itself, as it had done in the East, around the sovereigns. In Spain was produced a fairly strong religious centralization around the Visigothic king and the metropolitan of Toledo. In Gaul there was no chief metropolitan; but the king's court became, even sooner than that of Spain, the centre of episcopal affairs. The Britons and Irish, whose remoteness made them free from restriction, developed still more decided individuality. In short, the workings of all the Western episcopates, from Africa to the ocean, the Rhine and the Danube, lay outside the ordinary influence of the Roman see. All of them, even down to the metropolitan sees of Milan and Aquileia, practised a certain degree of autonomy, and in the 6th century this developed into what is called the Schism of the Three Chapters. With the exception of this schism, these episcopates were by no means in opposition to the Holy See. They always kept up relations of some kind, especially by means of pilgrimages, and it was admitted that in any disputes which might arise with the Eastern Church the pope had the right to speak as representative of the whole of the Western Church.

Rome and Constantinople.—This was the situation when St. Gregory was elected pope in 590. We may add that in peninsular Italy, which was most clearly under his ecclesiastical jurisdiction, the Lombards had spread havoc and ruin; so that nearly 90 bishoprics had been suppressed, either temporarily or definitively. The pope could act directly only on the bishoprics of the coast districts or the islands. Beyond this limited circle he had to act by means of diplomatic channels, through the governments of the Lombards, Franks and Visigoths. On the Byzantine side his hands were less tied; but here he had to reckon with the theory of the five patriarchates which had been a force since Justinian. According to Byzantine ideas, the Church was governed—under the supreme authority, of course, of the emperor—by the five patriarchs of Rome, Constantinople, Alexandria, Antioch and Jerusalem. Rome had for a long time opposed this division, but, since some kind of division was necessary, had put forward the idea of the three sees of St. Peter—Rome, Alexandria and Antioch—those of Constantinople and Jerusalem being set aside, as resulting from later usurpations. But the last named were just the most important; in fact the only ones which counted at all, since the monophysite secession had reduced the number of the orthodox in Syria and Egypt practically to nothing. This dissidence Islam was to complete, and by actually suppressing the patriarchate of Jerusalem to reduce Byzantine Christendom to the two patriarchates of Rome and Constantinople.

There was no comparison between the two from the point of view of the East. The new Rome, where the emperor reigned, prevailed over the old, which was practically abandoned to the

[1] Victor's conduct in this matter was not approved by a number of bishops (including Irenaeus), who protested against it (ἀντιπαρακελεύονται) in the interests of peace and Christian love (Eusebius, *Hist. eccl.* v. 24).—[ED.]

barbarians. She was still by courtesy given the precedence, but that was all; the council in Trullo (692) even claimed to impose reforms on her. When Rome, abandoned by the distant emperors, was placed under the protection of the Franks (754), relations between her and the Greek Church became gradually more rare, the chief occasions being the question of the images in the 8th century, the quarrel between Photius and Ignatius in the 9th, the affairs of the four marriages of the emperor Leo VI. and of the patriarch Theophylact in the 10th. On these different occasions the pope, ignored in ordinary times, was made use of by the Byzantine government to ratify measures which it had found necessary to adopt in opposition to the Greek episcopate.

These relations were obviously very different from those which had been observed originally, and it would be an injustice to the Roman Church to take them as typical of her relations with other Christian bodies. She had done all she could to defend her former position. Towards the end of the 4th century, when southern Illyricum (Macedonia, Greece, Crete) was passing under the authority of the Eastern emperor, she tried to keep it within her ecclesiastical obedience by creating the vicariate of Thessalonica. Pope Zosimus (417) made trial of a similar organization in the hope of attaching the churches of the Gauls more closely to himself. He also vainly struggled against the autonomy of Africa.

Gregory the Great, 590–604.—It was Gregory I. who, though with no premeditated intention, was the first to break this circle of autonomous or dissident Churches which was restricting the influences of the apostolic see. As the result of the missions sent to England by him and his successors there arose a church which, in spite of certain Irish elements, was and remained Roman in origin, and, above all, spirit and tendency. In it the traditions of old culture and religious learning imported from Rome, where they had almost ceased to bear any fruit, found a new soil, in which they flourished. Theodore, Wilfrid, Benedict Biscop, Bede, Boniface, Ecgbert, Alcuin, revived the fire of learning, which was almost extinct, and by their aid enlightenment was carried to the Continent, to decadent Gaul and barbarian Germany. The Churches of England and Germany, founded, far from all traditions of autonomy, by Roman legates, tendered their obedience voluntarily. In Gaul there was no hostility to the Holy See, but on the contrary a profound veneration for the great Christian sanctuary of the West.

The surprising thing is that, although Rome was then included within the empire of the Franks, so that the popes were afforded special opportunities for activity, they showed for the most part no eagerness to strengthen their authority over the clergy beyond the Alps. Appeals and other matters of detail were referred to them more often than under the Merovingians. They gave answers to such questions as were submitted to them; the machinery moved when set in motion from outside; but the popes did not attempt to interfere on their own initiative. The Frankish Church was directed, in fact, by the government of Charlemagne and Louis the Pious. When this failed, as happened during the wars and partitions which followed the death of Louis, the fate of this Church, with no effective head and under no regular direction, was very uncertain. It was then that a clerk who saw that there was but an uncertain prospect of help from the pope of his time, conceived the shrewd idea of appealing to the popes of the past, so as to exhort the contemporary generation through the mouth of former popes, from Clement to Gregory. This design was realized in the celebrated forgery known as the "False Decretals" (*see* DECRETALS).

Nicholas I., 858–867.—Hardly were they in circulation throughout the Frankish empire when it happened that a pope, Nicholas I., was elected who was animated by the same spirit as that which had inspired them. There was no lack of opportunities for intervening in the affairs not only of the Western but of the Eastern Church, and he seized upon them with great decision. He staunchly supported the patriarch Ignatius against his rival, Photius, at Constantinople; he upheld the rights of Teutberga, who had been repudiated by her husband, Lothair II. of Lorraine, against that prince and his brother, the emperor Louis II.; and he combated Hincmar, the powerful metropolitan of Rheims. It was in the course of this last dispute that the False Decretals found their way to Rome. Nicholas received them with some reserve; he refrained from giving them his sanction, and only borrowed from them what they had already borrowed from authentic texts, but in general he took up the same attitude as the forger had ascribed to his remote predecessors. The language of his successors, Adrian II. and John VIII., still shows some trace of the energy and pride of Nicholas. But the circumstances were becoming difficult. Europe was being split up under the influence of feudalism; Christendom was assailed by the barbarians, Norsemen, Saracens and Huns; at Rome the papacy was passing into the power of the local aristocracy, with whom after Otto I. it was disputed from time to time by the sovereigns of Germany. It was still being held in strict subjection by the latter when, towards the end of the 11th century, Hildebrand (Gregory VII.) undertook its enfranchisement.

In Eastern Christendom the papacy was at this period an almost forgotten institution, whose pretensions were always met by the combined opposition of the imperial authority, which was still preponderant in the Byzantine Church, and the authority of the patriarchate of Constantinople, around which centred all that survived of Christianity in those regions. To complete the situation, a formal rupture had occurred in 1054 between the patriarch Michael Cerularius and Pope Leo IX.

Position of the Papacy in Theory and Practice.—In the West, Rome and her sanctuaries had always been held in the highest veneration, and the pilgrimage to Rome was still the most important in the West. The pope, as officiating in these holiest of all sanctuaries, as guardian of the tombs of St. Peter and St. Paul and the inheritor of their rank, their rights, and their traditions, was the greatest ecclesiastical figure and the highest religious authority in the West. The greatest princes bowed before him; it was he who consecrated the emperor. In virtue of the spurious donation of Constantine, forged at Rome in the time of Charlemagne, which was at first circulated in obscurity, but ended by gaining universal credit, it was believed that the first Christian emperor, in withdrawing to Constantinople, had bestowed on the pope all the provinces of the Western empire, and that in consequence all sovereignty in the West, even that of the emperor, was derived from pontifical concessions. From all points of view, both religious and political, the pope was thus the greatest man of the West, the ideal head of all Christendom.

When it was necessary to account for this position, theologians quoted the text of the Gospels, where St. Peter is represented as the rock on which the Church is built, the pastor of the sheep and lambs of the Lord, the doorkeeper of the kingdom of heaven. The statements made in the New Testament about St. Peter were applied without hesitation to all the popes, considered as his successors, the inheritors of his see (*Petri sedes*) and of all his prerogatives. This idea, moreover, that the bishops of Rome were the successors of St. Peter was expressed very early—as far back as the 2nd century. Whatever may be said as to its historical value, it symbolizes very well the great authority of the Roman Church in the early days of Christianity; an authority which was then administered by the bishops of Rome, and came to be more and more identified with them. The councils were also quoted, and especially that of Nicaea, which does not itself mention the question, but certain texts of which contained the famous gloss: *Ecclesia Romana semper habuit primatum.* But this proof was rather insufficient, as indeed it was felt to be. The Gospel and unbroken tradition offered a better argument.

In his capacity as head of the church, "and president of the Christian *agape*," as St. Ignatius of Antioch would have said, the pope was considered to be the supreme president and moderator of the oecumenical assemblies. When the episcopate met in council the bishop of Rome had to be at its head. No decisions of a general nature, whether dogmatic or disciplinary, could be made without his consent. The appeal from all patriarchal or conciliary judgments was to him; and on those occasions when he had to depose bishops of the highest standing, notably those of Alexandria and Constantinople, his judgments

were carried into effect. During the religious struggles between the East and West he was on a few occasions condemned (by the Eastern council of Sardica, by Dioscorus, and by Photius); but the sentences were not carried out, and were even, as in the case of Dioscorus, considered and punished as sacrilegious attacks. In the West the principle, "prima sedes a nemine iudicatur," was always recognized and applied.

In ordinary practice this theoretically wide authority had only a limited application. The apostolic see hardly ever interfered in the government of the local Churches. Save in its own metropolitan province, it took no part in the nomination of bishops; the provincial or regional councils were held without its authorization; their judgments and regulations were carried out without any suggestion that they should be ratified by Rome. It is only after the False Decretals that we meet with the idea that a bishop cannot be deposed and his place filled without the consent of the pope. And it should be noticed that this idea was put forward, not by the pope with the object of increasing his power, but by the opinion of the Church with a view to defending the bishops against unjust sentences, and especially those inspired by the secular authority.

It was admitted, however, throughout the whole Church that the Holy See had an appellate jurisdiction, and recourse was had to it on occasion. At the council of Sardica (343) an attempt had been made to regulate the procedure in these appeals, by recognizing as the right of the pope the reversing of judgments, and the appointment of fresh judges. In practice, appeals to the pope, when they involved the annulling of a judgment, were judged by the pope in person.

But the intervention of the Holy See in the ecclesiastical affairs of the West, which resulted from these appeals, was only of a limited, sporadic and occasional nature. Nothing could have been more removed from a centralized administration than the condition in which matters stood with regard to this point. The pope was the head of the Church, but he exercised his authority only intermittently. When he did exercise it, it was far more frequently at the request of bishops or princes, or of the faithful, than of his own initiative.

Beginning of Temporal Power.—The Roman church had from a very early date possessed considerable wealth. Long before Constantine we find her employing it in aid of the most distant churches, as far afield as Cappadocia and Arabia. Her real property, confiscated under Diocletian, was restored by Constantine, and since then had been continually increased by gifts and bequests. In the 4th and 5th centuries the Roman Church possessed property in all parts of the empire; but gradually, whether because the confiscations of the barbarian emperors had curtailed its extent, or because the popes had made efforts to concentrate it nearer to themselves, the property of the Holy See came to be confined almost entirely to Italy. In the time of St. Gregory there subsisted only what lay in Byzantine Italy, the Lombards having confiscated the property of the Church as well as the imperial domains. During the quarrels between the papacy and the Byzantine Empire her domains in lower Italy and Sicily also disappeared as time went on, and the territorial possessions of the Roman Church were concentrated in the neighbourhood of Rome.

It was then, towards the middle of the 8th century, that the pope, who already exercised a great influence over the government of the city and province of Rome, defending her peacefully and with difficulty against the advancing Lombard conquests, saw that he was forced, short of the protection of the Greek Empire, to put himself under the protection of the Frankish princes. Thus there arose a kind of sovereignty, disputed, it is true, by Constantinople, but which succeeded in maintaining itself. Rome, together with such of the Byzantine territories as still subsisted in her neighbourhood, was considered as a domain sacred to the apostle Peter, and entrusted to the administration of his successor, the pope. To it were added the exarchate of Ravenna and a few other districts of central Italy, which had been recently conquered by the Lombards and retaken by Pippin and Charlemagne. Such was the foundation of the papal state.

The higher places in the government were occupied by the clergy, who for matters of detail made use of the civil and military officials who had carried on the administration under the Byzantine rule. But these lay officials could not long be content with a subordinate position, and hence arose incessant friction, which called for constant intervention on the part of the Frankish sovereigns. In 824 a kind of protectorate was organized, and serious guarantees were conceded to the lay aristocracy.

Shortly afterwards, in the partition of the Carolingian empire, Italy passed under the rule of a prince of its own, Louis II., who, with the title of emperor, made his authority felt in political matters. Shortly after his death (875) fresh upheavals reduced to nothing the power of the Carolingian princes; the clergy of Rome found itself without a protector, exposed to the animosity of the lay aristocracy. The authority of the pontificate was seriously impaired by these circumstances. One of the great families of Rome, that of the *vestiarius* Theophylact, took possession of the temporal authority, and succeeded in influencing the papal elections. After Theophylact the power passed to his daughter Marozia, a woman of the most debased character; then to her son Alberic, a serious-minded prince; and then to Alberic's son Octavius, who from "prince of the Romans" became pope (John XII.) when yet a mere boy. After Marozia and Alberic and the rest another branch of the same family, the Crescentii, exercised the temporal powers of the Holy See; and after them the same régime was continued by the counts of Tusculum, who were sprung from the same stock, which sometimes provided the Church with the most unlikely and least honourable pontiffs.

Election of the Popes.—The pope, like all the bishops, was chosen by means of election, in which both the clergy and the laity took part. The latter were represented in the most essential functions of the election by the aristocracy: at first by the senate, and later by the *exercitus romanus,* or rather of its staff, composed of Byzantine officers. It was the latter which gave rise to the feudal aristocracy which we see appearing under the Carolingians. The new pope was chosen by the principal members of the clergy and nobles, and then set before the assembled people, who gave their decision by acclamation; and this acclamation was accepted as the vote of the assembly of the faithful. The pope-elect was then put in possession of the episcopal house, and after waiting till the next Sunday his consecration was proceeded with. This ceremony was at first celebrated in the Lateran, but from Byzantine times onwards it took place at St. Peter's. It was also under the Byzantine régime that the condition was imposed that the pope should not be consecrated until the emperor had ratified his election. This had not been required under the old Latin emperors nor under the Gothic kings, and it disappeared of its own accord with the Byzantine régime. It was revived, however, by the emperor Louis the Pious, much to the disgust of the Romans, who resisted on several occasions. The Roman "princes" or "senators" in the 10th century went still further: it was they who actually nominated the pope. The same was the case with the Saxon emperors (Otto I., II. and III.), and in the 11th century of the lords of Tusculum, the latter nominating themselves and choosing members of their own family for the pontificate. When the emperor Henry III. (1046) put an end to this oppression it was only to substitute another. The popes of Tusculum did, at least, belong to the country, while the German kings chose bishops from the other side of the Alps.

The Hildebrandine Reform.—The entry of Hildebrand into the counsels of the papacy marks the beginning of a great change in this institution. He cannot, however, claim the honour of having opened the way which he impelled his predecessors to follow even before following it himself. All good Christians were calling for reforms; bishops, princes and monks were in agreement on this point when they spoke or acted according to their convictions. Many of them had tried to effect something; but these isolated efforts were often countermined by incompatible aims, and had produced no serious results. It is in the supreme head of the Church that the movement ought to have found its origin and inspiration. There was no dispute as to his possessing the authority in spiritual matters necessary to impose reform and

overbear the resistance which might arise; no one was better qualified than he to treat with the holders of the temporal power and obtain the support which was necessary from them. The Fathers of the Church had repeated times without number that the priesthood stands above even the supreme secular authority; the bible was full of stories most aptly illustrating this theory; nobody questioned that, within the Church, the pope was the vicar of Christ, and that, as such, his powers were unlimited; as proof positive could be cited—by councils and decretals—whether authentic or spurious; at any rate all authorized by long usage and taken as received authorities. It only remained to take possession of this incontestable power and use it with firmness and consistency. The example of Nicholas I., two centuries before, had shown the position which a pope could occupy in Christendom; but for a long time past the man had come short of the institution, the workman of his tool. Under Leo IX. (1048–1054) the pope suddenly came forward as the active and indefatigable champion of reform; simony and incontinence of the clergy were attacked by the one most qualified to purify the Church of them. Henceforth the way was open, and it became clear that, given good popes, the reform movement might be carried into effect. The choice of the pope was then subject to the pleasure of the sovereign of Germany, against whom the Roman feudal lords, devoted as they were to the old abuses, were in constant revolt. In the midst of the frequent changes of pope which went on during these years, and the political vicissitudes of Italy, Hildebrand took such measures as enabled him to checkmate the opposition of the Roman barons by turning against them, now the armed force of the Normans, now the influence of the German king[1]. Side by side with the general movement towards reform, he had set before himself the object of freeing the papacy, not only from its temporal oppressors but also from its protectors. He was successful at the council of 1059, the pontifical election was placed out of reach of the schemes of the local feudal lords and restored to the heads of the clergy; certain reservations were made with regard to those rights which the Holy See was considered to have conceded personally to Henry of Germany (the young king Henry IV., son of the emperor Henry III.), but nothing more. At the election of Alexander II. (1061–1073)—a rival who for a long time had been supported by the German king—and even at the election of Hildebrand, this rule had its effect. Henceforth the elections remained entirely free from those secular influences which had hitherto been so oppressive. In 1073 Hildebrand was raised to the pontifical throne by the acclamation of the people of Rome, under the name of Gregory VII.

Gregory VII., 1073–1085.—The work of reform was now in a good way; the freedom of the pontifical elections had been assured, which gave some promise that the struggle against abuses would be conducted successfully. All that now remained was to go on following wisely and firmly the way that had already been opened. But this attitude was not likely to appeal to the exuberant energy of the new pope. Now that Gregory's hands were no longer tied, he could act freely. The choice of the pope had been almost entirely removed from the sphere of secular influence, and especially from that of the German king. Gregory claimed that the same condition should apply to bishops, and these were the grounds of the dispute about investitures—a dispute which could find no solution, for it was impossible for the Teutonic sovereigns to renounce all interest in a matter of such importance in the workings of their state. Since the time of Clovis the German sovereigns had never ceased to intervene in such matters. But this question soon fell into the background. Gregory's contention was that the secular sovereigns should be entirely in the power of the head of the Church, and that he should be able to advance them or dispossess them at will, according to the estimate which he formed of their conduct. A terrible struggle arose between these obviously exorbitant demands and the resistance which they provoked. Its details cannot be described in this place (*see* INVESTITURES); we need only say that this ill-fated quarrel was not calculated to advance the reform movement, but rather to impede it, and, further, that it ended in failure. Gregory died far away from Rome, upon which he had brought incalculable evils; and not only Rome, but the papacy itself had to pay the penalty for the want of moderation of the pope. Great indeed was the difference between the state in which he received it and that in which he left it. We must not, however, let this mislead us. This struggle between spiritual and secular powers, owing to the tremendous sensation which it created throughout Christendom, showed the nations that at the head of the Church there was a great force for justice, always able to combat iniquity and oppression, and sometimes to defeat them, however powerful the evil and the tyrants might seem. The scene at Canossa, which had at the moment a merely relative importance, remained in the memories of men as a symbol which was hateful or comforting, according to the point of view from which it was considered.

(L. D.)

II. PERIOD FROM 1087 TO 1305

Gregory VII. had clearly revealed to the world the broad lines of the religious and political programme of the mediaeval papacy, and had begun to put it into execution. To reform the Church in every grade and purge the priesthood in order to shield it from feudal influences and from the domination of lay sovereignties; to convert the Church thus regenerated, spiritualized and detached from the world, into an organism which would be submissive to the absolute authority of the papal see, and to concentrate at Rome all its energies and jurisdictions; to establish the supremacy of the Roman see over all the Christian Churches, and win over to the Roman Church the Churches of the Byzantine Empire, Africa and Asia; to establish the temporal domain of St. Peter, not only by taking possession of Rome and Italy, but also by placing all the crowns of Europe under the supreme sovereignty of the popes, or even in direct vassalage to them; and, finally, to maintain unity of faith in Christendom and defend it against the attacks of unbelievers, Mussulmans, heretics and pagans—these were the main features of his scheme. The task, however, was so gigantic that after 150 years of strenuous effort, at the period which may be considered as the apogee of its power, that is, in the first half of the 13th century, the papacy had attained only incomplete results. At several points the work remained unfinished, for decadence followed close upon the moment of extreme greatness.

1. FROM URBAN II. TO CALIXTUS II. (1087–1124)

Gregory VII.'s successors accomplished the most pressing work by liberating the Church from feudal subjection, either by force or by diplomacy. This was, indeed, the indispensable condition of its internal and external progress. The great figure of this period is unquestionably the French Cluniac Urban II. (1088–99), who led the Hildebrandine reformation with more vehemence than Gregory himself and was the originator of the crusades. Never throughout the middle ages was pope more energetic, impetuous or uncompromising. His inflexible will informed the movement directed against the enemy within, against the simoniacal prelate and the princely usurper of the rights of the Church, and prescribed the movement against the enemy without, against the infidel who held the Holy Sepulchre. Urban set his hand to reforms from which his predecessor Gregory had recoiled. He simultaneously excommunicated several sovereigns and mercilessly persecuted the archbishops and bishops who were hostile to reform. He took no pains to temper the zeal of his legates, but incited them to the struggle, and, not content with prohibiting lay investiture and simony, expressly forbade prelates and even

[1]On the 5th of April 1058, six days after the death of Pope Stephen X., John, bishop of Velletri, the nominee of the Roman nobles, was enthroned as Pope Benedict X. Hildebrand set up Gerard, bishop of Florence, as a rival candidate, won over a part of the Romans to his cause, and secured the support of the empress regent Agnes at the Diet of Augsburg in June. Gerard was elected pope at Siena (as Nicholas II., *q.v.*) by those cardinals who had fled from Rome on the elevation of Benedict X. A synod was held at Sutri, at which the powerful Godfrey, duke of Lorraine and Spoleto, and margrave of Tuscany, and the chancellor Wibert were present. Measures were here concerted against Pope Benedict, who was driven out of Rome in Jan. 1059, Nicholas II. being regularly enthroned on the 24th of the same month. A synod assembled at the Lateran in April passed the famous new regulations for the elections to the papacy. (*See* CONCLAVE and LATERAN COUNCILS.)—[ED.]

priests to pay homage to the civil power. Distrusting the secular clergy, who were wholly sunk in the world, he looked to the regular clergy for support, and thus led the papacy into that course which it continued to pursue after his death. Henceforth the monk was to be the docile instrument of the wishes of Rome, to be opposed to the official priesthood according to Rome's needs. Urban was the first to proclaim with emphasis the necessity of a close association of the Curia with the religious orders, and this he made the essential basis of the theocratic government.

As the originator of the first crusade, Urban is entitled to the honour of the idea and its execution. There is no doubt that he wished to satisfy the complaints that emanated from the Christians dwelling in Jerusalem and from the pilgrims to the Holy Sepulchre, but it is no less certain that he was disturbed by the fears aroused throughout the Latin world by the recrudescence of Mussulman invasions, and particularly by the victory won by the Almoravides over the Christian army at Zalaca (1086). The progress of these African Mussulmans into Spain and their incessant piracies in Italy were perhaps the occasional cause that determined Urban II. to work upon the imagination of the infidels by an expedition into Syria. The papacy of that time believed in the political unity of Islam, in a solidarity—which did not exist—among the Mussulmans of Asia Minor, Syria, Egypt and the Barbary coasts; and if it waited until the year 1095 to carry out this project, it was because the conflict with the Germanic empire prevented the earlier realization of its dream. The essential reason of Urban II.'s action, and consequently the true cause of the crusade, was the ambition of the pope to unite with Rome and the Roman Church the Churches of Jerusalem, Antioch, Alexandria and even Constantinople, which the Greek schism had rendered independent. Urban II. addressed himself with wonted decision to the execution of this enormous enterprise. With him, as with all his successors, the idea of a collective expedition of Europe for the recovery of the holy places was always associated with the sanguine hope of extinguishing the schism at Constantinople, its very centre, by the substitution of a Latin for a Byzantine domination. Of these two objects, he was only to realize the former; but the crusade may well be said to have been his own work. He created it and preached it; he organized it, dominated it, and constantly supervised it. He was ever ready to act, either personally or through his delegates, and never ceased to be the effective leader of all the feudal soldiers he enrolled under the banner of the Holy See

The vast conflict aroused by the Hildebrandine reformation, and particularly the investiture quarrel, continued under the three successors of Urban II.; but with them it assumed a different character, and a tendency arose to terminate it by other means. The violence and disorders provoked by the struggle brought about a reaction, which was organized by certain prelates who advocated a policy of conciliation, such as the Frenchman Ivo, bishop of Chartres (*c.* 1040–1116). These conciliatory prelates were sincere supporters of the reformation, and combated simony, the marriage or concubinage of priests, and the immorality of sovereigns with the same conviction as the most ardent followers of Gregory VII. and Urban II ; but they held that the intimate union of Church and State was indispensable to the social order, and that the rights of kings should be respected as well as the rights of priests. The text they preached was harmony between the priesthood and the state. Dividing what the irreconcilables of the Hildebrandine party considered as an indissoluble whole, they made a sharp distinction between the property of the Church and the Church itself, between the political and territorial power of the bishops and their religious authority, and between the feudal investiture which confers lands and jurisdiction and the spiritual investiture which confers ecclesiastical rights. This doctrine gradually rallied all moderate minds, and finally inspired the directors of Christendom in Rome itself.

Paschal II., 1099–1118.—History has not fully recognized the Italian monk Paschal II., who was the equal of Urban in private virtues, personal disinterestedness, and religious conviction, but was surpassed by him in ardour and rigidity of conduct. Altered circumstances and tendencies of opinion called for a policy of conciliation. In France, Paschal granted absolution to Philip I.—who had many times been anathematized by his predecessors—and reconciled him solemnly with the Church, on the sole condition that he should swear to renounce his adulterous marriage. The pope could be under no delusion as to the value of this oath, which indeed was not kept; he merely regularized formally a state of affairs which the intractable Urban II. himself had never been able to prevent. As for the French question of the investitures, it was settled apparently without any treaty being expressly drawn up between the parties. The kings of France contemporary with Paschal II. ceased to practise spiritual investiture, or even to receive feudal homage from the bishops. They did not, however, renounce all intervention or all profit in the nominations to prelacies, but their intervention was no longer exhibited under the forms which the Hildebrandine party held to be illegal. In England, Paschal II. put an end to the long quarrel between the royal government and Anselm of Canterbury by accepting the Concordat of London (1107). The crown in England also abandoned investiture by the pastoral staff and ring, but, more fortunate than in France, retained the right of receiving feudal homage from the episcopate. As for Germany, the Emperor Henry V. wrung from the pope, by a display of force at Rome, concessions which provoked the indignant clamours of the most ardent reformers in France and Italy. It must not, however, be forgotten that, in the negotiations at Sutri, Paschal had pride and independence enough to propose to the emperor the only solution of the conflict that was entirely logical and essentially Christian, namely, the renunciation by the Church of its temporal power and the renunciation by the lay lords of all intervention in elections and investitures—in other words, the absolute separation of the priesthood and the state. The idea was contrary to the whole evolution of mediaeval Catholicism, and the German bishops were the first to repudiate it. At all events, it is certain that Paschal II. prepared the way for the Concordat of Worms.

On the other hand, with more acuteness than his predecessors, he realized that the papacy could not sustain the struggle against Germany unless it could rely upon the support of another Christian kingdom of the West; and he concluded with Philip I. of France and Louis the Fat, at the Council of Troyes (1107), an alliance which was for more than a century the salvation of the court of Rome. It is from this time that we find the popes in moments of crisis transporting themselves to Capetian territory, installing their governments and convening their councils there, and from that place of refuge fulminating with impunity against the internal and external foe. Without sacrificing the essential principles of the reformation, Paschal II. practised a policy of peace and reaction in every way contrary to that of the two preceding popes, and it was through him that the struggle was once more placed upon the religious basis.

Calixtus II. (1119–24).—Guy, archbishop of Vienne, who had been so keen to disavow the policy of Paschal II., was obliged to continue it when he assumed the tiara under the name of Calixtus II. By the Concordat of Worms, which he signed with the Emperor Henry V. in 1122, the investiture was divided between the ecclesiastical and the lay powers, the emperor investing with the sceptre, the pope with the pastoral staff and ring. The work did honour to the perseverance and ability of Calixtus, but it was merely the application of the ideas of Paschal II. and Ivo of Chartres. The understanding, however, between the two contracting parties was very far from being clear and complete, as each party still sought to attain its own aim by spreading in the Christian world divergent interpretations of the concordat and widely differing plans for reducing it to its final form. The two great agitations directed by the papacy at the end of the 11th century and the beginning of the 12th—the reformation and the crusade—were of capital importance for the foundation of the immense religious monarchy that had its centre in Rome; and it is from here that the papal monarchy actually dates.

The entry of the Christians into Jerusalem produced an extraordinary effect upon the faithful of the West. In it they saw the most manifest sign of the divine protection and of the supernatural power of the pope, the supreme director of the expedition

At its inception the Latin kingdom of the Holy Land was within a little of becoming an ecclesiastical principality, ruled by a patriarch under the authority of the pope. Daimbert, the first patriarch of Jerusalem, was convinced that the Roman Church alone could be sovereign of the new state, and attempted to compel Godfrey of Bouillon to hand over to him by a solemn agreement the town and citadel of Jerusalem, and also Jaffa. The clergy, indeed, received a large share; but the government of the Latin principality remained lay and military, the only form of government possible for a colony surrounded by perils and camped in a hostile country. Not only was the result of the crusade extremely favourable to the extension of the Roman power, but throughout the middle ages the papacy never ceased to derive almost incalculable political and financial advantages from the agitation produced by the preachers and the crusading expeditions

As for the reformation, which under Urban II. and his immediate successors was aimed not only at the episcopate but also at the capitulary bodies and monastic clergy, it, too, could but tend to a considerable extension of the authority of the successors of St. Peter, for it struck an irremediable blow at the ancient Christian hierarchy. The first manifest result of the change was the weakening of the metropolitans. The visible symptom of this decadence of the archiepiscopal power was the growing frequency during the Hildebrandine conflict of episcopal confirmations and consecrations made by the popes themselves or their legates. From an active instrument of the religious society, the archiepiscopate degenerated into a purely formal power; while the episcopate itself, which the sincere reformers wished to liberate and purge in order to strengthen it, emerged from the crisis sensibly weakened as well as ameliorated. The episcopate, while it gained in intelligence and morality, lost a part of its independence. It was raised above feudalism only to be abased before the two directing forces of the reformation, the papacy and the religious orders. To place itself in a better posture for combating the simoniacal and concubinary prelates, the court of Rome had had to multiply exemptions and accelerate the movement which impelled the monks to make themselves independent of the bishops. Even in the cities, the seats of the episcopal power, the reformation encouraged the attempts at revolt or autonomy which tended everywhere to diminish that power. The cathedral chapters took advantage of this situation to oppose their jurisdiction to that of the bishops, and to encroach on their prerogatives. When war was declared on the schismatic prelates, the reforming popes supported the canons, and, unconsciously or not, helped them to form themselves into privileged bodies living their own lives and affecting to recognize the court of Rome as their only superior authority.

Under Urban II.'s papacy the formulary of the papal bulls began to crystallize, and the letters amassed in the papal offices were differentiated clearly into great and little bulls, according to their style, arrangement and signs of validation Under Paschal II. the type of the leaden seal affixed to the bulls (representing the heads of the apostles Peter and Paul) was fixed, and the use of Roman minuscule finally substituted for that of the Lombard script.

2. HONORIUS II. TO CELESTINE III. (1124–1198)

After the reformation and the crusade the papal monarchy existed, and the next step was to consolidate and extend it. This task fell to the popes of the 12th century. Two of them in particular—the two who had the longest reigns—viz. Innocent II. and Alexander III., achieved the widest extension of the power entrusted to them, and in many respects their pontificates may be regarded as a preparation for and adumbration of the pontificate of Innocent III. This period, however, is characterized not only by the thoroughgoing development of the authority of the Holy See, but also by the severe struggle the popes had to sustain against the hostile forces that were opposed to their conquests or to the mere exercise of what they regarded as their right.

The Papacy and the German Emperors.—In the secular contest, Germany and its imperialist leaders were invariably the principal obstacle. Until the accession of Adrian IV., however, there had been considerable periods of tranquillity, years even of unbroken peace and alliance with the Germanic power. Under Honorius II. (1124–30), the empire, represented by Lothair III. of Supplinburg, yielded to the papacy, and Lothair, who was elected by the clergy and protected by the legates, begged the pope to confirm his election. Before his coronation he had renounced the right, so jealously guarded by Henry V., of assisting in the election of bishops and abbots, and he even undertook to refrain from exacting homage from the prelates and to content himself with fealty. This undertaking, however, did not prevent him from bringing all his influence to bear upon the ecclesiastical nominations. When the schism of 1130 broke out he endeavoured to procure the cancellation of the clauses of the Concordat of Worms and to recover lay investiture by way of compensation for the support he had given to Innocent II., one of the competing popes. This scheme, however, was frustrated by the firmness of Innocent and St. Bernard, and Lothair had to resign himself to the zealous conservation of the privileges granted to the Empire by the terms of the concordat. The ardour he had displayed in securing the recognition of Innocent and defending him against his enemies, particularly the anti-pope Anacletus and the kingdom of the Two Sicilies, involved him in a course which was not precisely favourable to the imperial rights. Innocent II. (1130–43) was the virtual master of this monarch, whose championship of the papacy brought not the smallest advantage, not even that of being crowned emperor with the habitual ceremonial at the place consecrated by tradition. It may even be maintained that his elevation was due solely to his personal claims This was a victory for Rome, and it was repeated in the case of the first Hohenstaufen, Conrad III., who owed his elevation (1138) mainly to the princes of the Church and the legate of Innocent II., by whom he was crowned. He also had to submit to the consequences of his origin on the occasion of a double election not foreseen by the Concordat of Worms, when he was forced to admit the necessity of appeal to Rome and to acknowledge the supremacy of the papal decision The situation changed in 1152, under Eugenius III. (1145–53) when Frederick Barbarossa was elected German king He notified his election to the pope, but did not seek the pope's approval None the less, Eugenius III felicitated the new sovereign on his election, and even signed the treaty of Constance with him (1153) The pope had need of Frederick to defend him against the revolted Romans and to help him to recover his temporal power, which had been gravely compromised Anastasius IV (1153–54) pursued the same policy, and summoned the German to Rome (1154) Frederick, however, was determined to keep the seat of the empire for himself, to dispute Italy with the pope, and to oppose the divine right of kings to the divine right of priests When he had taken Lombardy (1158) and had had the principles of the imperial supremacy proclaimed by his jurists at the diet of Roncaglia, the court of Rome realized that war was inevitable, and two energetic popes, Adrian IV. (1154–59) and Alexander III. (1159–81), resolutely sustained the struggle, the latter for nearly twenty years Victims of the communal claims at Rome, they constituted themselves the champions of similar claims in northern Italy, and their alliance with the Lombard communes ultimately led to success. In his duel with Barbarossa, Alexander III., one of the greatest of mediaeval popes, displayed extraordinary courage, address and perseverance. Yet we must not exaggerate the importance of the act by which Barbarossa, kneeling before his conqueror, recognized the spiritual supremacy of the Holy See, and swore fidelity and respect to it. In its final form, the truce of Venice was not only not unfavourable secularly to the Empire, but even granted it extensive advantages

Other Conflicts.—This great triumph was not the only success gained by Alexander III. over lay sovereigns. The conflict of the priesthood with the kingdoms and nations that were tending to aggrandize themselves by transcending the religious limits of the mediaeval theocracy took place in another theatre. The affair of Thomas Becket (*q.v.*) involved the papacy in a quarrel with the powerful monarchy of the Angevins, whose representative, Henry II., was master of England and of half of France. Alexander's diplomatic skill and moral authority, reinforced by the Capetian alliance and the revulsion of feeling

caused by the murder of Becket, enabled him to force the despotic Henry to yield, and even to do penance at the tomb of the martyr.

Unfortunately for the papacy, the successors of Alexander III. lacked vigour, and their pontificates were too brief to allow them to pursue a strong policy against the Germanic imperialism. Never were the leaders of the Church in such jeopardy as during the reign of Barbarossa's son, Henry VI. This vigorous despot, whose ambitions were not all chimerical, had succeeded where his predecessors, including Frederick, had failed. His marriage with the heiress of the old Norman kings had made him master of Sicily and the duchy of Apulia and Calabria, and he succeeded in conquering and retaining almost all the remainder of the peninsula.

The Norman kingdom, which had conquered Sicily and southern Italy at the end of the 11th century, was almost as grave a source of anxiety to the popes of this period. Not only was its very existence an obstacle to the spread of their temporal power in the peninsula, but it frequently acted in concert with the pope's enemies and thwarted the papal policy. The attempts of Honorius II. (1128) and Innocent II. (1139) to wrest Apulia and Calabria from King Roger II., and Adrian IV.'s war with William I. (1156), were one and all unsuccessful; and the papacy had to content itself with the vassalage and tribute of the Normans, and allowed them to organize the ecclesiastical government of their domains in their own fashion, to limit the right of appeal to Rome, and to curtail the power of the Roman legates. At this period, moreover, the "Norman question" was intimately connected with the "Eastern question." The Norman adventurers in possession of Palermo and Naples perpetually tended to look for their aggrandizement to the Byzantine empire. In the interests of their temporal dominion, the 12th-century popes could not suffer an Italian power to dominate on the other side of the Adriatic and instal itself at Constantinople. This contingency explains the vacillating and illogical character of the papal diplomacy with regard to the Byzantine problem, and, *inter alia,* the opposition of Eugenius III. in 1150 to Roger II.'s projected crusade, directed towards the conquest of the Greek state.

As regards its temporal aims on Italy, the most inconvenient and tenacious, if not the most dangerous, adversary of the 12th-century papacy was the Roman commune. Since the middle of the 12th century the party of municipal autonomy and, indeed, the whole of the European middle classes, who wished to shake off the feudal yoke and secure independence, had been ranged against the successor of St. Peter. The first symptoms of resistance were exhibited under Innocent II. (1142), who was unable to stem the growing revolution or prevent the establishment of a Roman senate sitting in the Capitol. The strength of classical reminiscence and the instinct of liberty were reinforced by the support given to communal aspirations by the popular agitator and dangerous tribune, Arnold of Brescia (*q.v.*), whose theories arrived at an opportune moment to encourage the revolted commons. He denied the power of clerks to possess fiefs, and allowed them only religious authority and tithes. The successors of Innocent II. were even less successful in maintaining their supremacy in Rome. Lucius II., when called upon to renounce all his regalian rights, fell mortally wounded in an attempt to drive the autonomists by force from the Capitol (1145). Under Eugenius III. the Romans sacked and destroyed the houses of the clerks and cardinals, besieged St. Peter's and the Lateran, and massacred the pilgrims. The pope was forced to fly with the Sacred College, to escape the necessity of recognizing the commune, and thus left the field free to Arnold of Brescia (1145). On his return to Rome, Eugenius had to treat with his rebel subjects and to acknowledge the senate they had elected, and he was unable to procure the expulsion of the agitator. The more energetic Adrian IV. refused to truckle to the municipality, placed it under an interdict (1155), and allied himself with Frederick Barbarossa to quell an insurrection which respected the rights of emperors no more than the rights of popes. From the moment that Arnold of Brescia, absorbed in his chimerical project of reviving the ancient Roman republic, disregarded the imperial power and neglected to shelter himself behind the German in his conflict with the priesthood, his failure was certain and his fate foredoomed. He was hanged and burned, probably in pursuance of the secret agreement between the pope and the emperor; and Adrian IV. was reconciled with the Romans (1156). The commune, however, subsisted, and was on several occasions strong enough to eject the masters who were distasteful to it. Unfortunately for Alexander III. the Roman question was complicated during his pontificate with the desperate struggle with the empire. The populace of the Tiber welcomed and expelled him with equal enthusiasm, and when his body was brought back from exile, the mob went before the *cortège* and threw mud and stones upon the funeral litter. All obeyed the pontiff of Rome—save Rome itself. Lucius III., who was pope for four years (1181–1185), remained in Rome four months, while Urban III. and Gregory VIII. never entered the city. At length the two parties grew weary of this state of revolution, and a régime of conciliation, the fruit of mutual concessions, was established under Clement III. By the act of 1188, the fundamental charter of the Roman commune, the people recognized the supremacy of the pope over the senate and the town, while the pope on his part sanctioned the legal existence of the commune and of its government and assemblies.

Development of Centralized Organization.—Although among other obstacles, the popes of the 12th century had experienced some difficulty in subduing the inhabitants of the city, which was the seat and centre of the Christian world, their monarchy did not cease to gain in authority, solidity and prestige, and the work of centralization, which was gradually making them masters of the whole ecclesiastical organism, was accomplished steadily and without serious interruption. If Rome expelled them, they always found a sure refuge in France, where Alexander III. carried on his government for several years; and the whole of Europe acknowledged their immense power. Under Honorius II. the custom prevailed of substituting legates *a latere,* simple priests or deacons of the Curia, for the regionary delegates, who had grown too independent; and that excellent instrument of rule, the Roman legate, carried the papal will into the remotest courts of Europe. The episcopate and the great monastic prelacies continued to lose their independence, as was shown by Honorius II. deputing a cardinal to Monte Cassino to elect an abbot of his choosing. The progress of the Roman power was especially manifested under Innocent II., who had triumphed over the schism, and was supported by the empire and by Bernard of Clairvaux, the first moral authority of his time.

At the second Lateran Council (1139), Innocent II. declared to the bishops that he was the absolute master of Christendom. "Ye know," he said, "that Rome is the capital of the world, that ye hold your dignities of the Roman pontiff as a vassal holds his fiefs of his sovereign, and that ye cannot retain them without his assent." Under Eugenius III., the papal absolutism grew weaker, and the cardinals are once said to have addressed to the pope this astounding protest: "Thou must know that it is by us thou hast been raised to the supreme dignity. We are the hinges (*cardines*) upon which the universal Church rests and moves. It is through us that from a private person thou hast become the father of all Christians. It is, then, no longer to thyself but rather to us that thou belongest henceforth. Thou must not sacrifice to private and recent friendships the traditional affections of the papacy. Perforce thou must consult before everything the general interest of Christendom, and must consider it an obligation of thine office to respect the opinions of the highest dignitaries of the court of Rome." Under Alexander III., however, the papacy became more powerful than ever. The recently created royalties sought from the papacy the conservation of their titles and the benediction of their crowns, and placed themselves voluntarily in its vassalage. The practice of the nomination of bishops by the Curia and of papal recommendation to prebends and benefices of every kind grew daily more general, and the number of appeals to Rome and exemptions granted to abbeys and even to simple churches increased continually. The third Lateran Council (1179) was a triumph for the leader of the Church. At that council wise and urgent measures were taken against the abuses that discredited the priesthood, but the principle of appeals and exemptions and the ques-

tion of the increasing abuse of the power wielded by the Roman legates remained untouched. The treatise on canon law known as the *Decretum Gratiani,* which was compiled towards the middle of the 12th century, propagated doctrines in favour of the power of the Holy See, established the superiority of the popes over the councils, and gave legal force to their decretals.

It was by its constant reliance on monachism that the papacy of the 12th century had attained this result, and the popes of that period were especially fortunate in having for their champion the monk St. Bernard, whose admirable qualities enabled him to dominate public opinion. St. Bernard completed the reformation, combated heresy, and by his immense moral ascendancy gained victories by which Rome benefited. As instances of his more direct services, he put an end to the schism of 1130 and attached Italy and the world to the side of Innocent II.

Resistance to Papal Power.—At the moment when the papacy thus attained omnipotence, symptoms of discontent and opposition arose. The bishops resisted centralization. Archbishop Hildebert of Tours protested to Honorius II. against the appeals to Rome, while others complained of the exactions of the legates, or, like John of Salisbury, animadverted upon the excessive powers of the bureaucracy at the Lateran. In the councils strange speeches were heard from the mouths of laymen, who were beginning to carry to extreme lengths the spirit of independence with regard to Rome. When a question arose at Toulouse in 1160 as to the best means of settling the papal schism, this audacious statement was made before the kings of France and England: "That the best course was to side with neither of the two popes; that the apostolic see had been ever a burden to the princes; that advantage must be taken of the schism to throw off the yoke; and that, while awaiting the death of one of the competitors, the authority of the bishops was sufficient in France and England alike for the government of the churches." The ecclesiastics themselves, however, were the first to denounce the abuses at Rome. In common with all enlightened opinion, St. Bernard complained bitterly of the excessive multiplication of exemptions, of the exaggerated extension of appeals to Rome, of the luxury of the Roman court, of the venality of the cardinals, and of the injury done to the traditional hierarchy by the very extent of the papal power, which was calculated to turn the strongest head. In St. Bernard's treatise *De consideratione,* addressed to Pope Eugenius III., the papacy receives as many reprimands and attacks as it does marks of affection and friendly counsel. "I do not find," he said, "that St. Peter ever appeared in public loaded with gold and jewels, clad in silk, mounted on a white mule, surrounded by soldiers and followed by a brilliant retinue. In the glitter that environs thee, rather wouldst thou be taken for the successor of Constantine than for the successor of Peter."

Rome, however, had greater dangers to cope with than the indignant reproofs of her friends the monks, and the opposition of the bishops, who were displeased at the spectacle of their authority waning day by day. It was at this period that the Catholic edifice of the middle ages began to be shaken by the boldness of philosophical speculation as applied to theological studies and also by the growth of heresy. Hitherto more tolerant of heresy than the local authorities, the papacy now felt compelled to take defensive measures against it, and especially against Albigensianism, which had made great strides in the south of France since the middle of the 12th century. Innocent II., Eugenius III. and Alexander III. excommunicated the sectaries of Languedoc and their abettors, Alexander even sending armed missions to hunt them down and punish them. But the preaching of the papal legates, even when supported by military demonstrations, had no effect; and the Albigensian question, together with other questions vital for the future of the papacy, remained unsettled and more formidable than ever when Innocent III. was elected.

3. INNOCENT III. TO ALEXANDER IV. (1198-1261)

Under the pontificates of Innocent III. (1198–1216) and his five immediate successors the Roman monarchy seemed to have reached the pinnacle of its moral prestige, religious authority and temporal power, and this development was due in great measure to Innocent III. himself. Innocent was an eminent jurist and canonist, and never ceased to use his immense power in the service of the law. Indeed, a great part of his life was passed in hearing pleadings and pronouncing judgments, and few sovereigns have ever worked so industriously or shown such solicitude for the impartial exercise of their judicial functions. It is difficult to comprehend Innocent's extraordinary activity. Over and above the weight of political affairs, he bore resolutely for 18 years the overwhelming burden of the presidency of a tribunal before which the whole of Europe came to plead. To him, also, in his capacity of theologian, the whole of Europe submitted every obscure, delicate or controverted question, whether legal problem or case of conscience. This, undoubtedly, was the part of his task that Innocent preferred, and it was to this, as well as to his much overrated moral and theological treatises, that he owed his enormous contemporary prestige. As a statesman, he certainly committed grave faults—through excess of diplomatic subtlety, lack of forethought, and sometimes even through ingenuousness; but it must with justice be admitted that, in spite of his reputation for pugnacity and obstinacy, he never failed, either by temperament or on principle, to exhaust every peaceful expedient in settling questions. He was averse from violence, and never resorted to bellicose acts or to the employment of force save in the last extremity. If his policy miscarried in several quarters it was eminently successful in others; and if we consider the sum of his efforts to achieve the programme of the mediaeval papacy, it cannot be denied that the extent of his rule and the profound influence he exerted on his times entitle him to be regarded as the most perfect type of mediaeval pope and one of the most powerful figures in history.

A superficial glance at Innocent's correspondence is sufficient to convince us that he was pre-eminently concerned for the reformation and moral welfare of the Church, and was animated by the best intentions for the re-establishment in the ecclesiastical body of order, peace and respect for the hierarchy. This was one of the principal objects of his activity, and this important side of his work received decisive sanction by the promulgation of the decrees of the fourth Lateran Council (1215). At this council almost all the questions at issue related to reform, and many give evidence of great breadth of mind, as well as of a very acute sense of contemporary necessities. Innocent's letters, however, not only reveal that superior wisdom which can take into account practical needs and relax severity of principle at the right moment, as well as that spirit of tolerance and equity which is opposed to the excess of zeal and intellectual narrowness of subordinates, but they also prove that, in the internal government of the Church, he was bent on gathering into his hands all the motive threads, and that he stretched the absolutist tradition to its furthest limits, intervening in the most trifling acts in the lives of the clergy, and regarding it as an obligation of his office to act and think for all. The heretic peril, which increased during his pontificate, forced him to take decisive measures against the Albigenses in the south of France, but before proscribing them he spent ten years (1198–1208) in endeavouring to convert the misbelievers, and history should not forget the pacific character of these early efforts. It was because they did not succeed that necessity and the violence of human passions subsequently forced him into a course of action which he had not chosen and which led him further than he wished to go. When he was compelled to decree the Albigensian crusade he endeavoured more than once to discontinue the work, which had become perverted, and to curb the crusading ardour of Simon de Montfort. Failing in his attempt to maintain the religious character of the crusade, he wished to prevent it from ending secularly in its extreme consequence and logical outcome.

Papal Imperialism under Innocent III.—It was particularly in the definitive constitution of the temporal and political power of the papacy, in the extension of what may be called Roman imperialism, that chance favoured his efforts and enabled him to pursue his conquests farthest. This imperialism was undoubtedly of a special nature; it rested on moral authority and

political and financial power rather than on material and military strength. But it is no less certain that Innocent attempted to subject the kings of Europe by making them his tributaries and vassals. He wished to acquire the mastery of souls by unifying the faith and centralizing the priesthood, but he also aspired to possess temporal supremacy, if not as direct owner, at least as suzerain, over all the national crowns, and thus to realize the idea with which he was penetrated and which he himself expressed clearly. He wished to be at once pope and emperor, leader of religion and universal sovereign. And, in fact, he exercised or claimed suzerain rights, together with the political and pecuniary advantages accruing, over the greater number of the lay sovereigns of his time. He was more or less effectively the supreme temporal chief of the kingdom of Sicily and Naples, Sardinia, the states of the Iberian peninsula (Castile, Leon, Navarre and Portugal), Aragon (which, under Peter II., was the type of vassal and tributary kingdom of the Roman power), the Scandinavian states, the kingdom of Hungary, the Slav states of Bohemia, Poland, Servia, Bosnia and Bulgaria, and the Christian states founded in Syria by the crusaders of the 12th century. The success of Roman imperialism was particularly remarkable in England, where Innocent was confronted by one of the principal potentates of the West, by the heir of the power that had been founded by two statesmen of the first rank, William the Conqueror and Henry II. In Richard I. and John he had exceptionally authoritative adversaries; but after one of the fiercest wars ever waged by the civil power against the Church, Innocent at length gained over John the most complete victory that has ever been won by a religious potentate over a temporal sovereign, and constrained him to make complete submission. In 1213 the pope became not only the nominal suzerain but, *de facto* and *de jure,* the veritable sovereign of England, and during the last years of John and the first years of Henry III. he governed England effectively by his legates.

The papacy, however, encountered serious obstacles, at first at the very centre of the papal empire, at Rome, where the pope had to contend with the party of communal autonomy for ten years before being able to secure the mastery at Rome. His immense authority narrowly escaped destruction but a stone's-throw from the Lateran palace; but the victory finally rested with him, since the Roman people could not dispense with the Roman Church, to which it owed its existence. Reared in the nurture of the pope, the populace of the Tiber renounced its stormy liberty in 1209, and accepted the peace and order that a beneficent master gave; but when Innocent attempted to extend to the whole of Italy the régime of paternal subjection that had been so successful at Rome, the difficulties of the enterprise surpassed the powers even of a leader of religion. As guardian of Henry VI.'s son Frederick, Innocent was for some time able to conduct the government of the kingdom of the Two Sicilies, but he was entirely unable, either by diplomacy or force of arms, to make Italian unity redound to the exclusive benefit of the Holy See. Nor was his failure due to lack of activity or energy, but rather to the insuperable obstacles in his path—the physical configuration of Italy, and, above all, the invincible repugnance of the Italian municipalities.

As far as the Empire was concerned, chance at first favoured Innocent. For ten years a Germany weakened and divided by the rivalry of Philip of Swabia and Otto of Brunswick left his hands free to act in Italy, and his pontificate marks a period of comparative quiet in the ardent conflict between pope and emperor which continued throughout the middle ages. Not until 1210, when Otto of Brunswick turned against the pope to whom he owed his crown, was Innocent compelled to open hostilities; and the struggle ended in a victory for the Curia. Frederick II., the new emperor created by Innocent, began by handing over his country to Rome and sacrificing the rights of the empire to the union of the two great authorities of the Christian world. In his dealings with Frederick, Innocent experienced grievous vicissitudes and disappointments, but finally became master of the situation. One nation only—the France of Philip Augustus—was able to remain outside the Roman vassalage.

Finally, Innocent III. was more fortunate than his predecessors, and, if he did not succeed in carrying out his projected crusade and recovering the Holy Places, he at least benefited by the Franco-Venetian expedition of 1202. Europe refused to take any direct action against the Muslim, but Latin feudalism, assembled at Venice, diverted the crusade by an act of formal disobedience, marched on Constantinople, seized the Greek empire and founded a Latin empire in its place; and Innocent had to accept the *fait accompli.* Though condemning it on principle, he turned it to the interests of the Roman Church as well as of the universal Church. With joy and pride he welcomed the Byzantine East into the circle of vassal peoples and kingdoms of Rome bound politically to the see of St. Peter, and with the same emotions beheld the patriarchate of Constantinople at last recognize Roman supremacy. But from this enormous increase of territory and influence arose a whole series of new and difficult problems. The court of Rome had to substitute for the old Greek hierarchy a hierarchy of Latin bishops; to force the remaining Greek clergy to practise the beliefs and rites of the Roman religion and bow to the supremacy of the pope; to maintain in the Greco-Latin Eastern Church the necessary order, morality and subordination; to defend it against the greed and violence of the nobles and barons who had founded the Latin Empire; and to compel the leaders of the new empire to submit to the apostolic power and execute its commands. In his endeavours to carry out the whole of this programme, Innocent III. met with insuperable obstacles and many disappointments. On the one hand, the Greeks were unwilling to abandon their religion and national cult, and scarcely recognized the ecclesiastical supremacy of the papacy. On the other hand, the upstart Latin emperors, far from proving submissive and humble tools, assumed with the purple the habits and pretensions of the sovereigns they had dispossessed. Nevertheless, Innocent left his successors a much vaster and more stable political dominion than that which he had received from his predecessors, since it comprised both East and West; and his five immediate successors were able to preserve this ascendancy. They even extended the limits of Roman imperialism by converting the pagans of the Baltic to Christianity, and further reinforced the work of ecclesiastical centralization by enlisting in their service a force which had recently come into existence and was rapidly becoming popular—the mendicant orders, and notably the Dominicans and Franciscans. The Roman power was also increased by the formation of the universities—privileged corporations of masters and students, which escaped the local power of the bishop and his chancellor only to place themselves under the direction and supervision of the Holy See. Mistress of the entire Christian organism, Rome thus gained control of international education, and the mendicant monks who formed her devoted militia lost no time in monopolizing the professorial chairs. Although the ecclesiastical monarchy continued to gain strength, the successors of Innocent III. made less use than he of their immense power. Under Gregory IX. (1227–1241) and Innocent IV. (1243–1254) the conflict between the priesthood and the Empire was revived by the enigmatic Frederick II., the polyglot and lettered emperor, the friend of Saracens, the despot who, in youth styled "king of priests," in later years personified ideas that were directly opposed to the mediaeval theocracy; and the struggle lasted nearly 30 years. The Hohenstaufen succumbed to it, and the papacy itself received a terrible shock, which shook its vast empire to the foundations.

Nevertheless, the first half of the 13th century may be regarded as the grand epoch of mediaeval papal history. Supreme in Europe, the papacy gathered into a body of doctrine the decisions given in virtue of its enormous *de facto* power, and promulgated its collected decrees and *oracula* to form the immutable law of the Christian world. Innocent III., Honorius III. and Gregory IX. employed their jurists to collect the most important of their rulings, and Gregory's decrees became the definitive repository of the canon law. Besides making laws for the Christendom of the present and the future, these popes employed themselves in giving a more regular form to their principal administrative organ, the offices of the Curia. The development of the Roman chancery

is also a characteristic sign of the evolution that was taking place.

4. URBAN IV. TO BENEDICT XI. (1261-1305)

This period comprises 13 pontificates, all short (three or four years at the most, and some only a few months), with the exception of that of Boniface VIII., who was pope for nine years. This accidental fact constitutes a prime difference in favour of the preceding period, in which there were only five pontiffs during the first 60 years of the 13th century.

Influence of France.—Although there was no theoretical restriction to the temporal supremacy and religious power of the papacy, certain historical facts of great importance contributed to the fatal diminution of their extent. The first of these was the preponderance of the French monarchy and nation in Europe. Founded by the conquests of Philip Augustus and Louis VIII. and legitimated and extended by the policy and moral influence of the crowned saint, Louis IX., the French monarchy enjoyed undisputed supremacy at the end of the 13th century and the beginning of the 14th; and this hegemony of France was manifested, not only by the extension of the direct power exercised by the French kings over all the neighbouring nationalities, but also by the establishment of Capetian dynasties in the kingdom of the Two Sicilies and in Hungary. From this time the sovereign of Rome, like other sovereigns, had to submit to French influence. But, whereas the pope was sometimes compelled to become the instrument of the policy of the kings of France or the adventurers of their race, he was often able to utilize this new and pervading force for the realization of his own designs, although he endeavoured from time to time, but without enduring success, to shake off the overwhelming yoke of the French.

It was the Frenchman Urban IV. (1261–1264) who called Charles of Anjou into Italy to combat the last heirs of Frederick II. and thus paved the way for the establishment of the Angevin dynasty on the throne of Naples. Under Clement IV. (1265–1268), an agreement was concluded by which Sicily was handed over to the brother of St. Louis, and the victories of Benevento (1266) and Tagliacozzo (1267) assured the triumph of the Guelph party and enabled the Angevins to plant themselves definitely on Neapolitan soil. Conradin's tragic and inevitable end closed the last act of the secular struggle between the Holy See and the empire. Haunted by the recollection of that formidable conflict and lulled in the security of the Great Interregnum, which was to render Germany long powerless, the papacy thought merely of the support that France could give, and paid no heed to the dangers threatened by the extension of Charles of Anjou's monarchy in central and northern Italy. The Visconti Gregory X. (1271–1276) made an attempt to bring about a reaction against the tendency which had influenced his two immediate predecessors. He placed himself outside the theatre of French influence, and occupied himself solely with the task of giving to the papal monarchy that character of universality and political superiority which had made the greatness of an Alexander III. or an Innocent III. He opposed the aggrandizing projects of the Angevins, intervened in Germany with a view to terminating the Great Interregnum, and sought a necessary counterpoise to Capetian predominance in an alliance with Rudolph of Habsburg, who had become an emperor without imperilling the papacy. The Orsini Nicholas III. pursued the same policy with regard to the independence and greatness of the Roman See, but died too soon for the cause he upheld, and, at his death in 1280, the inevitable current revived with overpowering force. His successor, Martin IV. (1281–1285), a prelate of Champagne, brother of several councillors of the king of France, prebendary at Rouen and Tours, and one of the most zealous in favour of the canonization of Louis IX., ascended the papal throne under the auspices of Charles of Anjou, and undertook the government of the Church with the sole intention of furthering in every way the interests of the country of his birth. A Frenchman before everything, he abased the papal power to such an extent as to excite the indignation of his contemporaries, often slavishly subordinating it to the exigencies of the domestic and foreign policy of the Angevins at Naples and the reigning house at Paris. But he was prevented from carrying out this policy by an unforeseen blow, the Sicilian Vespers (March 1282), an event important both in itself and in its results. By rejecting the Capetian sovereign that Rome wished to thrust upon it to deliver it from the dynasty of Aragon, the little island of Sicily arrested the progress of French imperialism, ruined the vast projects of Charles of Anjou, and liberated the papacy in its own despite from a subjection that perverted and shook its power. Honorius IV. (1285–1287) and Nicholas IV. (1288–1292) were able to act with greater dignity and independence than their predecessors. Though remaining leagued with the Angevins in southern Italy, they dared to look to Germany and Rudolph of Habsburg to help them in their efforts to add to the papal dominion a part of northern Italy and, in particular, Tuscany. But they still continued to desire the restoration of the Angevin dynasty in Sicily and to assist the designs of France on Aragon by preaching a crusade against the masters of Barcelona and Palermo. The hopes of the Curia were frustrated by the resistance of the Aragonese and Sicilians, and Charles of Valois, to whom the Curia eventually destined the crown of Aragon, had to resign it for that of Constantinople, which he also failed to secure.

Subjection to France.—Boniface VIII. (1294–1303) also at the beginning of his pontificate had yielded to the current, and, like his predecessors, adapted his external policy to the pretensions and interests of the great Capetian house, which, like all his predecessors, he at first countenanced. In spite of his instincts for dominion and the ardour of his temperament, he made no attempt to shake off the French yoke, and did not decide on hostilities with France until Philip the Fair and his legists attempted to change the character of the kingship, emphasized its lay tendencies, and exerted themselves to gratify the desire for political and financial independence which was shared by the French nation and many other European peoples. The war which ensued between the pope and the king of France ended in the complete defeat of the papacy, which was reduced to impotence (1303), and though the storm ceased during the nine months' pontificate of Benedict XI., the see of St. Peter recovered neither its normal equilibrium nor its traditional character. The accession of the first Avignon pope, Clement V., marks the final subjection of the papal power to the Capetian government, the inevitable result of the European situation created in the preceding century.

In other respects the papacy of this period found itself in a very inferior situation to that which it had occupied under Innocent III. and the popes of the first half of the 13th century. The fall of the Latin empire and the retaking of Constantinople by the Palaeologi freed a great part of the Eastern world from the political and religious direction of Rome, and this fact necessarily engaged the diplomacy of Urban IV. and his successors in an entirely different direction. To them the Eastern problem presented a less complex aspect. There could no longer be any serious question of a collective expedition of Europe for the recovery of the Holy Places. The ingenuous faith of a Louis IX. was alone capable of giving rise to two crusades organized privately and without the influence or even the approval of the pope. But the European state of mind no longer lent itself to such enterprises.

The main preoccupation of all these popes was how best to repair the injury done to orthodox Europe and to Rome by the destruction of the Latin empire. Several of them thought of restoring the lost empire by force, and thus giving a pendant to the fourth crusade; but the Curia finally realized the enormous difficulties of such a project, and convinced themselves that the only practical solution of the difficulty was to come to an understanding with the Palaeologi and realize pacifically the long-dreamed union of the Greek and Latin Churches. The negotiations begun by Urban IV. and continued more or less actively by his successors were at last concluded in 1274 by Gregory X. The Council of Lyons proclaimed the union, which was destined to be effective for a few years at least and to be prolonged precariously in the midst of unfavourable circumstances. The Greek mind was opposed to the union; the acquiescence of the Byzantine emperors was but an ephemeral expedient of their foreign policy; and the peace between the Latins and Greeks settled on Byzantine soil could not endure for long. The principal obstacle, however,

was the incompatibility of the popes' Byzantine and Italian policies. The popes were in favour of Charles of Anjou and his dynasty, but Charles was hostile to the union of the two Churches, since it was his intention to seize the Byzantine empire and substitute himself for the Palaeologi. Almost all the successors of Urban IV. were compelled to exert their diplomacy against the aggrandizing aims of the man they had themselves installed in southern Italy, and to protect the Greek emperor, with whom they were negotiating the religious question. On several occasions between the years 1271 and 1273 the Angevins of Naples, who had great influence in Achaea and Albania and were solidly supported by their allies in the Balkan peninsula, nearly carried out their project; and in 1274 the opposition of Charles of Anjou came near to compromising the operations of the council of Lyons and ruining the work of Gregory X. The papacy, however, held its ground, and Nicholas III., the worthy continuer of Gregory, succeeded in preserving the union and triumphing over the Angevin power. The Angevins took their revenge under Martin IV., who was a stanch supporter of the French. Three weeks after his coronation Martin excommunicated the Greek emperor and all his subjects, and allied himself with Charles of Anjou and the Venetians to compass his downfall. In this case, too, the Sicilian Vespers was the rock on which the hopes and pretensions of the sovereign of Naples suffered shipwreck. After Martin's death the last popes of the 13th century, and notably Boniface VIII., in vain thought to find in another Capetian, Charles of Valois, the man who was to re-establish the Latin dominion at Byzantium. But the East was lost; the union of 1274 was quickly dissolved; and the reconciliation of the two Churches again entered into the category of chimeras.

Decay.—During this period the papal institution, considered in the development of its inner life, already showed signs of decadence. The diminution of religious faith and sacerdotal prestige shook it to its very foundations. The growth of the lay spirit continued to manifest itself among the burgesses of the towns as well as among the feudal princes and sovereigns. The social factors of communism and nationalism, against which Innocent III. and his successors had struggled, became more powerful and more hostile to theocratic domination. That a sovereign like St. Louis should be able to associate himself officially with the feudalism of his realm to repress abuses of church jurisdiction; that a contemporary of Philip the Fair, the lawyer Pierre Dubois, should dare to suggest the secularization of ecclesiastical property and the conversion of the clergy into a class of functionaries paid out of the royal treasury; and that Philip the Fair, the adversary of Boniface VIII., should be able to rely in his conflict with the leader of the Church on the popular consent obtained at a meeting of the three estates of France—all point to a singular demoralization of the sentiments and principles on which were based the whole power of the pontiff of Rome and the entire organization of mediaeval Catholicism. Both by its attitude and by its governmental acts, the papacy of the later 13th century itself contributed to increase the discredit and disaffection from which it suffered. Under Urban IV. and his successors the great moral and religious sovereignty of former times became a purely bureaucratic monarchy, in which the main preoccupation of the governors appeared to be the financial exploitation of Christendom. The continued efforts of the popes to drain Christian gold to Rome were limited only by the fiscal pretensions of the lay sovereigns, and it was this financial rivalry that gave rise to the inevitable conflict between Boniface VIII. and Philip the Fair.

By thus devoting itself to material interests, the papacy contemporary with the last Capetians lost its moral greatness and fell in the opinion of the peoples; and it did itself no less injury by the abnormal extension of the bounds of its absolutism. By its exaggerated methods of centralization the papal monarchy had absorbed within itself all the living forces of the religious world and suppressed all the liberties in which the Church of old had lived. The subjection of the secular clergy was complete, while the episcopate retained no shadow of its independence. The decree of Clement IV. (1266), empowering the papacy to dispose of all vacant bishoprics at the court of Rome, merely sanctioned a usage that had long been established. But the control exercised by the Roman Curia over the episcopate had been realized by many other means. It was seldom that an episcopal election took place without a division in the chapter, in which resided the electoral right. In such an event, the competitors appealed to the Holy See and abdicated their right, either voluntarily or under coercion, *in manibus papae*, while the pope took possession of the vacant see. Nominations directly made by the court of Rome, especially in the case of dioceses long vacant, became increasingly numerous. The principle of election by canons was repeatedly violated, and threatened to disappear; and at the end of the 13th century the spectacle was common of prelates, whether nominated or confirmed by the pope, entitling themselves "bishops by the grace of the Holy See."

The regular clergy, who were almost wholly sheltered from the power of the diocesan bishops, found themselves, even more than the secular priesthood, in a state of complete dependence on the Curia. The papacy of this period continually intervened in the internal affairs of the monasteries. Not only did the monks continue to seek from the papacy the confirmation of their privileges and property, but they also referred almost all their disputes to the arbitration of the pope. Their elections gave rise to innumerable lawsuits, which all terminated at the court of Rome, and in most cases it was the pope himself who designated the monks to fill vacant posts in the abbeys. Thus the pope became the great ecclesiastical elector as well as the universal judge and supreme legislator. On this extreme concentration of the Christian power was employed throughout Europe an army of official agents or officious adherents of the Holy See, who were animated by an irrepressible zeal for the aggrandizement of the papacy. These officials originally consisted of an obedient and devoted militia of mendicant friars, both Franciscans and Dominicans, who took their orders from Rome alone, and whose efforts the papacy stimulated by lavishing exemptions, privileges and full sacerdotal powers.

The sovereign direction of this enormous monarchy belonged to the pope alone, who was assisted in important affairs by the advice and collaboration of the College of Cardinals, who had become the sole electors to the papacy. Towards the close of the 13th century the necessity arose for an express ruling on the question of the exercise of this electoral right. In 1274 Gregory X., completing the measures taken by Alexander III. in the 12th century, promulgated the celebrated constitution by which the cardinal-electors were shut up in conclave and, in the event of their not having designated the new pope within three days, were constrained to perform their duty by a progressive reduction of their food-allowance (*see* CONCLAVE). But at the head of this vast body there existed a constant tendency which was opposed to the absorption of all the power by a single and unbridled will. In the last years of this period fresh signs appeared of a reaction that emanated from the Sacred College itself. The cardinal-electors endeavoured to derive from their electoral power a right of control over the acts of the pope elect. In 1294, and again in 1303, they laid themselves under an obligation, previously to the election, to subscribe to the political engagements which each promised rigorously to observe in the event of his becoming pope. In general, these engagements bore upon the limitation of the number of cardinals, the prohibition to nominate new ones without previous notification to the Sacred College, the sharing between the cardinals and the pope of certain revenues specified by a bull of Nicholas IV., and the obligatory consultation of the consistories for the principal acts of the temporal and spiritual government. It is conceivable that a pope of Boniface VIII.'s temperament would not submit kindly to any restriction of the discretionary power with which he was invested by tradition, and he endeavoured to make the cardinals dependent on him and even to dispense with their services as far as possible, only assembling them in consistory in cases of extreme necessity. This tendency of the Sacred College to convert the Roman Church into a constitutional monarchy, in which it should itself play the part of parliament, was a sufficiently grave symptom of the progress of the new spirit. But throughout the ecclesiastical society traditional bonds were

loosened and anarchy was rife, and this at the very moment when the enemies of the priesthood and its leaders redoubled their attack. In fine, the decadence of the papal institution manifested itself in an irremediable manner when it had accomplished no more than the half of its task. The growth of national kingdoms, the anti-clerical tendencies of the emancipated middle classes, the competition of lay imperialisms, and all the other elements of resistance which had been encountered by the papacy in its progress and had at first tended to shackle it, now presented an insurmountable barrier The papacy was weakened by its contest with these adverse elements, and it was through its failure to triumph over them that its dream of European dominion, both temporal and spiritual, entered but very incompletely into the field of realities (A. Lu)

III. FROM 1305 TO 1590

The accession of the Gascon Clement V. (1305–1314) marks the beginning of a new era in the history of the papacy; for this pope, formerly archbishop of Bordeaux, remained in France, without once crossing the threshold of the Eternal City. Clement's motive for this resolution was his fear that the independence of the ecclesiastical government might be endangered among the frightful dissensions and party conflicts by which Italy was then convulsed; while at the same time he yielded to the pressure exercised on him by the French king, Philip the Fair. In March 1309 Clement V. transferred his residence to Avignon, a town which at that time belonged to the king of Naples, but was surrounded by the countship of Venaissin, which as early as 1228 had passed into the possession of the Roman See. Clement V. remained at Avignon till the day of his death, so that with him begins the so-called Babylonian Exile of the popes. Through this, and his excessive subservience to Philip the Fair, his reign proved the reverse of salutary to the Church The pope's subservience was above all conspicuous in his attitude towards the proceedings brought against the order of the Temple, which was dissolved by the Council of Vienne (*see* TEMPLARS)

Character of the Avignon Papacy.—His successor John XXII. (1316–1334), a native of Cahors, was elected as the result of very stormy negotiations, after a two years' vacancy of the see (1316). Like his predecessor he fixed his permanent residence at Avignon, where he had formerly been bishop. But while Clement V. had contented himself with the hospitality of the Dominican monastery at Avignon, John XXII installed himself with great state in the episcopal palace, hard by the cathedral. The essential features of this new epoch in the history of the papacy, beginning with the two popes mentioned, are intimately connected with this lasting separation from the traditional seat of the papacy, and from Italian soil in general: a separation which reduced the head of the Church to a fatal dependence on the French kings Themselves Frenchmen, and surrounded by a college of cardinals in which the French element predominated, the popes gave to their ecclesiastical administration a certain French character, till they stood in more and more danger of serving purely national interests, in cases where the obligations of their office demanded complete impartiality. And thus the prestige of the papacy was sensibly diminished by the view, to which the jealousy of the nations soon gave currency, that the supreme dignity of the Church was simply a convenient tool for French statecraft. The accusation might not always be supported by facts, but it tended to shake popular confidence in the head of the universal Church, and to inspire other countries with the feeling of a national opposition to an ecclesiastical régime now entirely Gallicized. The consequent loosening of the ties between the individual provinces of the Church and the Apostolic See, combined with the capricious policy of the Court at Avignon, which often regarded nothing but personal and family interests, accelerated the decay of the ecclesiastical organism, and justified the most dismal forebodings for the future. To crown all, the feud between Church and Empire broke out again with unprecedented violence The most prominent leaders of the opposition to the papacy, whether ecclesiastical or political, joined forces with the German king, Louis of Bavaria, and offered him their aid against John XXII The clerical opposition was led by the very popular and influential Minorites who were at that time engaged in a remarkably bitter controversy with the pope as to the practical interpretation of the idea of evangelical poverty. Their influence can be clearly traced in the appeal to a general council, issued by Louis in 1324 at Sachsenhausen near Frankfurt-on-the-Main. This document, which confused the political problem with the theological, was bound to envenom the quarrel between emperor and pope beyond all remedy. Side by side with the Minorites, the spokesmen of the specifically political opposition to the papacy were the Parisian professors, Marsilius of Padua and John of Jandun, the composers of the *Defender of the Peace* (*defensor pacis*). In conjunction with the Minorites and the Ghibellines of Italy, Marsilius succeeded in enticing Louis to the fateful expedition to Rome and the revolutionary actions of 1328 The conferring of the imperial crown by the Roman populace, the deposition of the pope by the same body, and the election of an anti-pope in the person of the Minorite Pietro da Corvara, translated into acts the doctrines of the *defensor pacis.* The struggle, which still further aggravated the dependence of the pope on France, was waged on both sides with the utmost bitterness, and the end was not in sight when John XXII died, full of years, on Dec 4, 1334

Even the following pope, Benedict XII. (1334–1342), a man of the strictest morality, failed, in spite of his mild and pacific disposition, to adjust the conflict with Louis of Bavaria and the eccentric Fraticelli King Philip VI. and the cardinals of the French party worked energetically against the projected peace with Louis, and Benedict was not endowed with sufficient strength of will to carry through his designs in the teeth of their opposition

His efforts in the direction of reform, moreover, deserve recognition In Avignon he began to erect himself a suitable residence, which, with considerable additions by later popes, developed into the celebrated papal castle of Avignon

Benedict XII. was also succeeded, in 1342, by a Frenchman from the south, Pierre Roger de Beaufort, who was born in the castle of Maumont, in the diocese of Limoges He assumed the title of Clement VI (1342–1352) In contrast with his peace-loving predecessor, and in accordance with his own more energetic character, he pursued with decision and success the traditions of John XXII in his dealings with Louis of Bavaria. With great dexterity he turned the feud between the houses of Luxemburg and Wittelsbach to the destruction of Louis; and the death-struggle between the two seemed about to break out, when Louis met his untimely end To all appearances the victory of the papacy was decisive· but it was a Pyrrhic victory, as events were quickly to prove In Rome there ensued, during the pontificate of Clement, the revolutions of the visionary Cola di Rienzi (*q v*) who restored the old republic, though not for long By his purchase of Avignon, and the creation of numerous French cardinals, the pope consolidated the close connection of the Roman Church with France: but the interests of that church suffered severely through the riches and patronage which Clement lavished on his relatives, and through the princely luxury of his court

It was fortunate for the Church that Clement VI was followed by a man of an entirely different temperament—Innocent VI (1352–1362). This strict and upright pope appears to have taken Benedict XII for his example. He undertook, though not with complete success, a reformation of ecclesiastical abuses; and it was he who assisted in restoring the Empire at last to some measure of stability But the culminating glory of his reign was the restoration of the almost ruined papal dominion in Italy, by means of the highly-gifted Cardinal Albornoz. The restoration of the Apostolic See to its original and proper seat was now possible; and the need for such a step was the more pressing, since residence in the castle at Avignon had become extremely precarious, owing to the ever-increasing confusion of French affairs

The Return to Rome.—The intention of Innocent was put into execution by his successor—the learned and pious Urban V. (1362–1370). Two events of the first magnitude make his reign one of the most memorable in the century. The first of these was the return to Rome This was an object which the emperor

Charles IV. had prosecuted with all his energies; which alone could revive the languishing reputation of the papacy, by withdrawing it from the turmoils of the Anglo-French war, and bring within the bounds of possibility the much-needed reformation in ecclesiastical affairs. In 1367 it became an accomplished fact. Turning a deaf ear to the remonstrances of the French king and the French cardinals, the pope quitted Avignon on April 13, 1367; and on Oct. 16 he entered Rome, now completely fallen to ruin. The ensuing year, after his return to the Eternal City, witnessed the second great landmark in the reign of Urban V.—the Roman expedition of Charles IV., and the renewal of amicable relations between the Empire and the Church. Unfortunately, the pope failed to deal satisfactorily with the highly complicated situation in Italy; and the result was that, on Sept. 27, 1370, he returned to Avignon, where he died on the following Dec. 19.

Gregory XI. (1370–1378), though equally distinguished for his erudition and pure morals, his piety, modesty and wisdom, was fated to pay dearly for the weakness of his predecessor in abandoning Rome so early. He lived to see the national spirit of Italy thoroughly aroused against a papacy turned French. The disastrous error of almost exclusively appointing Provençals, foreigners ignorant of both the country and the people, to the government of the Papal States, now found a terrible Nemesis: and there came a national upheaval, such as Italy had not yet witnessed. The feud between Italian and Frenchman broke out in a violent form; and it was in vain that St. Catherine of Siena proffered her mediation in the bloody strife betwixt the pope and the Florentine republic. The letters that she addressed to the pontiff, on this and other occasions, are documents, which are, perhaps, unique in their kind, and of great literary beauty. It was also St. Catherine who prevailed on Gregory XI. to return to Rome. On Sept. 13, 1376, he left Avignon; on Jan. 17, 1377, he made his entry into the city of St. Peter. Thus ended the exile in France; but it left an evil legacy in the schism under Gregory's successor. Gregory, the last pope whom France has given to the Church, died on March 27, 1378, after taking measures to ensure a speedy and unanimous election for his successor.

The Great Schism.—The conclave, which took place in Rome for the first time for 75 years, resulted in the election of Bartolomeo Prignano (April 8, 1378), who took the name of Pope Urban VI. (1378–1389). Canonically the election was perfectly valid; so that the only popes to be regarded as legitimate are the successors of Urban. (*See* Pastor, *Geschichte der Päpste*, i., 121.) It is true that his election was immediately impugned by the cardinals on frivolous grounds; but the responsibility for this rests, partially at least, with the pope himself, whose reckless and inconsiderate zeal for reform was bound to excite a revolution among the worldly cardinals still yearning for the fleshpots of Avignon. This revolution could already be foreseen with tolerable certainty, when Urban embroiled himself even with his political friends—the queen of Naples and her husband, Duke Otto of Brunswick. Similarly, he quarrelled with Count Onorato Gaetano of Fondi. The cardinals, excited to the highest pitch of irritation, now knew where they could look for support. Thirteen of them assembled at Anagni, and thence, on Aug. 9, issued a passionate manifesto, announcing the invalidity of Urban's election, on the ground that it had been forced upon the conclave by the Roman populace. As soon as the rebellious cardinals were further assured of the protection of the French king, Charles V., they elected, with the tacit consent of the three Italian cardinals, Robert of Geneva, as anti-pope (Fondi, Sept. 20). Robert assumed the style of Clement VII.; the Great Schism (1378–1417) had begun.

The chief responsibility for this rests with the worldly college of cardinals, who were longing to return to France, and thence drew their inspiration. This college was a creation of the Avignon period; which must therefore, in the last resort, be considered responsible for this appalling calamity. Severe censure, moreover, attaches to Charles V., of France. There may be room for dispute as to the extent to which the king's share in the schism was due to the instigation of the revolted cardinals; there can be not the slightest doubt that his attitude was the decisive factor in perpetuating and widening the breach. The anti-pope was recognized not only by Charles of France, but by the princes of the Empire dependent on him, by Scotland and Savoy, and finally by the Spanish dominions and Portugal. On the other hand, the emperor, Charles IV., and his son, Wenceslaus, the greater part of the Empire, England, Hungary, Poland, Denmark, Norway and Sweden, together with the majority of the Italian States—Naples excepted—remained loyal to the pope. Urban, in fact—who meanwhile had created a new college of cardinals with members of different nationalities—enjoyed one great advantage; his rival failed to hold his own in Italy, with which country the actual decision virtually lay. Unfortunately, in the time that followed, Urban was guilty of the grossest errors, pursuing his personal interests, and sacrificing, all too soon, that universal point of view which ought to have governed his policy. The struggle against his powerful neighbour on the frontier, Queen Joanna of Naples, rapidly became his one guiding motive; and thus he was led into a perfect labyrinth of blunders. He excommunicated the queen as a stiff-necked adherent of the French anti-pope, and in 1381 conferred Naples on the ambitious Charles of Durazzo, with whom he was soon inextricably embroiled; while, a little later, he fell out with his new college of cardinals. On Oct. 15, 1389, he died with few to lament him.

Boniface IX.—After the death of Urban VI., 14 cardinals of his obedience assembled, and after prolonged negotiations elected for this high office Cardinal Pietro Tomacelli (Nov. 2, 1389). The title which he took was that of Boniface IX. (1389–1404). The new pope—a man of high moral character, great sagacity, eloquence, and of a kindly disposition—at once instituted an entirely different policy from that pursued by his predecessor. This was especially the case in his treatment of Naples. In May 1390 Ladislaus, the son of Charles of Durazzo, who had been assassinated in the February of 1386, received the royal crown at the hands of a papal legate. To his cause Boniface IX. closely attached himself; and his support of the king against the Angevins cost him enormous sums, without which Ladislaus could not have secured his victory over the French claimant. By these means, the schism was averted from Italy, and Naples won for the Roman obedience. The situation in the papal State, which Boniface found in the greatest confusion, was at the outset far more difficult to deal with. But here also he attained in time a considerable measure of success, although the methods employed were scarcely above criticism. His greatest success, however, was gained in the Eternal City itself; for he contrived, after many vicissitudes, to induce the Romans to annul their republican constitution and acknowledge the papal supremacy, even in municipal matters.

To give this supremacy a firmer basis, Boniface fortified the Vatican and the Capitol, and restored the castle of St. Angelo—which had previously been used as a quarry—providing it with walls and battlements, and erecting a tower in the centre. This castle, indeed, yielded a safe shelter to the pope in Jan. 1400 when the Colonnas made their attempt to surprise Rome. However, the adventure failed; and by the aid of Ladislaus, the castles of the Colonnas in the vicinity of Rome were destroyed. In 1401 this powerful family made its submission, accepting the favourable terms which the pope had had the good sense to offer. Henceforward quiet prevailed, and Boniface ruled as a stern master in Rome.

Thus Boniface IX., as a secular prince, occupies an important position; but as pope his activity must be unfavourably judged. Even if Dietrich of Niem frequently painted him too black, there is no question that the means which Boniface employed to fill the papal treasury seriously impaired the prestige of the highest spiritual office and the reverence due to it. His nepotism, again, casts a dark shadow over his memory: but most regrettable of all was his indifference towards the ending of the schism

Crisis in Papal History.—On the death of Boniface (Oct 1, 1404), the Roman cardinals once more elected a Neapolitan, Cosimo dei Migliorati, who, at the age of 65, assumed the name of Innocent VII. (1404–1406). Innocent, who was animated by a great love for the sciences and all the arts of peace, enjoyed only a brief pontificate, but his reign is not without importance, if only

as an example of the generous patronage which the papacy—even in its darkest days—has lavished on literature and science. Significant also is the foothold gained at this time in the Curia itself by the humanists—Poggio, Bruni and others.

The crisis came to a head in the pontificate of Gregory XII. (1406–1415). This pope, so distinguished in many respects, owed his election mainly to the circumstance that he was considered a zealous champion of the restoration of unity within the Church: and he displayed, in fact, during the earlier portion of his reign, an exalted enthusiasm for this great task. Later his attitude changed; and the protracted negotiations for a conference with Benedict XIII. remained fruitless. The result of this change in the attitude of Gregory was the formation of a strong malcontent party in the college of cardinals; to counteract whose influence, the pope—faithless to the conditions attached to his election—resorted to the plan of creating new members.

At the same period, the relations of Benedict XIII. (antipope 1394) with France suffered a significant modification. It became more and more manifest that Benedict had no genuine desire to heal the schism in the Church, in spite of the ardent zeal for union which he had displayed immediately before and after his election. In May 1408 France withdrew from his obedience; and it was not long before French policy succeeded in effecting a reconciliation and understanding between the cardinals of Benedict XIII. and those who had seceded from Gregory XII. Precisely as if the Holy See were vacant, the cardinals began to act as the actual rulers of the Church, and issued formal invitations to a council to be opened at Pisa on the Feast of the Annunciation (March 25) 1409. Both popes attempted to foil the disaffected cardinals by convening councils of their own; but their efforts were doomed to failure.

On the other hand, the council of the cardinals—though, by the strict rules of canonical law, its convocation was absolutely illegal—attained the utmost importance. But these rules, and, in fact, the whole Catholic doctrine of the primacy were almost entirely obscured by the schism. Scholars like Langenstein, Gerson and Zabarella, evolved a new theory as to oecumenical councils, which from the point of view of Roman Catholic principles must be described as revolutionary. At the synod of the dissident cardinals assembled at Pisa, views of this type were in the ascendant; and, although protests were not lacking, the necessities of the time served as a pretext for ignoring all objections.

The Triple Schism.—That the council was merely a tool in the hands of the ambitious and adroit Baldassare Cossa, was a fact unsuspected by its members, who were animated by a fiery enthusiasm for the re-establishment of ecclesiastical unity; nor did they pause to reflect that an action against *both* popes could not possibly be lawful. Since whole universities and numerous scholars had pronounced in favour of the new theories, the Pisan synod dismissed all canonical scruples, and unhesitatingly laid claim to authority over both popes, one of whom was necessarily the legitimate pope. It was in vain that Carlo di Malatesta, a staunch adherent of Gregory, sought at the eleventh hour to negotiate a compromise between Gregory and the synod. It was in vain that this cultured prince, imbued with the principles of humanism, represented to the cardinals that this new path would lead quickly to the goal, but that this goal could not be unity but a triple schism. The council declared that it was canonically convened, oecumenical, and representative of the whole Catholic Church; then proceeded immediately to the trial and deposition of Benedict XIII. and Gregory XII. The synod grounded its procedure against the rival popes on a fact, ostensibly patent to all, but actually believed by none—that they were both supporters of the schism, and not merely this, but *heretics* in the truest and fullest sense of the word, since their attitude had impugned and subverted the article of faith concerning the one Holy, Catholic and Apostolic Church. On the ground of this extremely dubious declaration, designed to compensate for the absence of any authentic and firm foundation in ecclesiastical law, the Pisan assembly on June 5 announced the deposition of Gregory XII. and Benedict XIII., as manifest heretics and partisans of the schism. The next step was to elect a new pope; and on June 26, 1409, the choice fell on the venerable cardinal-archbishop of Milan, the Greek Petros Filargis, who assumed the title of Alexander V. (1409–1410).

Alexander V., the pope of the council, died on May 3, 1410. The cardinals at once elected his successor—Baldassare Cossa, who took the name of John XXIII. (1410–1415). Of all the consequences of the disastrous Pisan council, the election of this man was the most unfortunate. True, it cannot be demonstrated that all the fearful accusations afterwards levelled at John XXIII. were based on fact: but it is certain that this cunning politician was so far infected with the corruption of his age that he was not in the least degree fitted to fulfil the requirements of the supreme ecclesiastical dignity. From him the welfare of the Church had nothing to hope. All eyes were consequently turned to the energetic German king, Sigismund, who was inspired by the best motives, and who succeeded in surmounting the formidable obstacles which barred the way to an oecumenical council. It was mainly due to Sigismund's indefatigable and magnificent activity, that the Council of Constance met and was so numerously attended. It is remarkable how fortune seemed to assist his efforts. The capture of Rome by King Ladislaus of Naples had compelled John XXIII. to take refuge in Florence (June 1413), where that dangerous guest received a not very friendly welcome. Since John's most immediate need was now protection and assistance against his terrible opponent Ladislaus, he sent, towards the close of Aug. 1413, Cardinals Chalant and Francesco Zabarella, together with the celebrated Greek Manuel Chrysoloras, to King Sigismund, and commissioned them to determine the time and place of the forthcoming council. The agreement was soon concluded. On Dec. 9 John XXIII. signed the bull convening the council at Constance, and pledged his word to appear there in person. He might have hoped that his share in convening the synod would give him a certain right to regulate its proceedings, and that, by the aid of his numerous Italian prelates, he would be able to influence it more or less according to his views. But in this he was greatly deceived. So soon as he realized the true position of affairs he attempted to break up the council by his flight to Schaffhausen (March 20–21, 1415)—a project in which he would doubtless have succeeded but for the sagacity and energy of Sigismund.

In spite of everything, the excitement in Constance was unbounded. In the midst of the confusion, which reigned supreme in the council, the upper hand was gained by that party which held that the only method by which the schism could be ended and a reformation of ecclesiastical discipline ensured was a drastic limitation of the papal privileges. The limitation was to be effected by the general council: consequently, the pope must be brought under the jurisdiction of that council, and—in the opinion of many—remain under its jurisdiction for all time. Thus, in the 3rd, 4th and 5th general sessions it was enacted, with characteristic precipitation, that an oecumenical council could not be dissolved or set aside by the pope, without its consent: the corollary to which was, that the present council, notwithstanding the flight of John XXIII., continued to exist in the full possession of its powers, and that, in matters pertaining to belief and the eradication of schism, all men—even the pope—were bound to obey the general council, whose authority extended over all Christians, including the pope himself.

By these decrees—which created as the supreme authority within the Church a power which had not been appointed as such by Christ—the members of the Council of Constance sought to give their position a theoretical basis before proceeding to independent action against the pope. But these declarations as to the superiority of an oecumenical council never attained legal validity, in spite of their defence by Pierre d'Ailly and Gerson. Emanating from an assembly without a head, which could not possibly be an oecumenical council without the assent of one of the popes (of whom one was necessarily the legitimate pope)—enacted, in opposition to the cardinals, by a majority of persons for the most part unqualified, and in a fashion which was thus distinctly different from that of the old councils—they can only be regarded as a *coup de main*, a last resort in the universal

confusion. On May 29 the council deposed John XXIII.

The legitimate pope, Gregory XII., now consented to resign, but under strict reservation of the legality of his pontificate. By consenting to this, the synod indirectly acknowledged that its previous sessions had not possessed an oecumenical character, and also that Gregory's predecessors, up to Urban VI., had been legitimate popes. In presence of the council, reconstituted by Gregory, Malatesta announced the resignation of the latter; and the grateful assembly appointed Gregory *legatus a latere* to the marches of Ancona—a dignity which he was not destined to enjoy for long, as he died on Oct. 18, 1417. (*See* CONSTANCE, COUNCIL OF.)

Restoration of Unity.—From the abdication of Gregory XII. to the election of Martin V., the Apostolic See was vacant; and the council, newly convened and authorized by the legitimate pope before his resignation, conducted the government of the Church. After the condemnation and burning of John Huss (*q.v.*), the reformation of the Church, both in its head and members, claimed the main attention of the fathers of the council. Among the many difficulties which beset the question, not the least obvious was the length of time during which the Church must remain without a ruler, if—as Sigismund and the German nation demanded—the papal election were deferred till the completion of the internal reforms. The result was decided by the policy of the cardinals, who since May 1417 had openly devoted their whole energies to the acceleration of that election; and union was preserved by means of a compromise arranged by Bishop Henry of Winchester, the uncle of the English king. The terms of the agreement were that a synodal decree should give an absolute assurance that the work of reformation would be taken in hand immediately after the election; reforms, on which all the nations were already united, were to be published *before* the election; and the mode of the papal election itself was to be determined by deputies. When the last-named condition had been fulfilled on Oct. 28 the conclave began, on Nov. 8, 1417, in the *Kaufhaus* of Constance; and, no later than St. Martin's day, the cardinal-deacon, Oddo Colonna, was elected Pope Martin V. (1417–1431).

With the accession of Martin V. unity was at last restored to the Church, and contemporary Christendom gave way to transports of joy. Any secular power—a bitter opponent of the papacy admits—would have succumbed in the schism: but so wonderful was the organization of the spiritual empire, and so indestructible the conception of the papacy itself, that this (the deepest of all cleavages) served only to prove its indivisibility (Gregorovius, *Geschichte Roms.* vi.). Martin V. appeared to possess every quality which could enable him to represent the universal Church with strength and dignity. In order to maintain his independence, he energetically repudiated all proposals that he should establish his residence in France or Germany, and once more took up his abode in Rome. On Sept. 30, 1420, he made his entry into the almost completely ruinous town. To repair the ravages of neglect, and, more especially, to restore the decayed churches, Martin at once expended large sums; while, later, he engaged famous artists, like Gentile da Fabriano and Masaccio, and encouraged all forms of art by every means within his power. Numerous humanists were appointed to the chancery, and the Romans were loud in their praise of the papal régime.

Nor was the activity of Martin V. less successful in political than in ecclesiastical reform, which latter included the combating of the Fraticelli, the amendment of the clergy, the encouragement of piety by the regulation of feast-days, the recommendation of increased devotion to the sacrament of the altar, and the strengthening of the conception of the Church by the great jubilee of 1423. At the same time the crowning reward of his labours was the effacing of the last traces of the schism. He prosecuted successfully the conflict with the adherents of Benedict XIII., who, till the day of his death (May 23, 1423: *vide* the *Chronicle of Martin de Alpartil*, edited by Ehrle, 1906) clung to the remnants of his usurped authority (*see* BENEDICT XIII.). An attempt on the part of Alphonso V. of Aragon to renew the schism failed; and, in 1429, the Spaniard was compelled to give up his anti-pope, Clement VIII. Martin died on Feb. 20, 1431, and the inscription on his grave—still preserved in the Lateran church—styles him "the felicity of his age" (*temporum suorum felicitas*).

The Second Schism.—The Colonna pope was followed by the strict, moral and pious Gabriel Condulmaro, under the title of Eugenius IV. (1431–1447). His pontificate was not altogether happy. At the very first, his violent and premature measures against the Colonna family, which had received such unbounded favour from his predecessor, embroiled him in a sanguinary feud. Far worse, however, were the conflicts which Eugenius had to support against the Council of Basel—already dissolved on Dec. 18, 1431. At the beginning, indeed, a reconciliation between the pope and council was effected by Sigismund who, on May 31, 1433, was crowned emperor at Rome. But, as early as May 29, 1434, a revolution broke out in Rome, which on June 4 drove the pope in flight to Florence; where he was obliged to remain, while Giovanni Vitelleschi restored order in the papal State.

The migration of Eugenius IV. to Florence was of extreme importance; for this town was the real home of the new art, and the intellectual focus of all the humanistic movements in Italy. At Florence the pope came into closer contact with the humanists, and to this circumstance is due the gradual dominance which they attained in the Roman Curia.

The Italian troubles, which had entailed the exile of Eugenius IV., were still insignificant in comparison with those conjured up by the fanatics of the council in Basel. The decrees enacted by that body made deep inroads on the rights of the Holy See; and the conflict increased in violence. On July 31, 1437, the fathers of Basel summoned Eugenius IV. to appear before their tribunal. The pope retorted on Sept. 18 by transferring the scene of the council to Ferrara—afterwards to Florence. There, in July 1439, the union with the Greeks was effected: but it remained simply a paper agreement. On June 25, 1439, the synod—which had already pronounced sentence of heresy on Eugenius IV., by reason of his obstinate disobedience to the assembly of the Church—formally deposed him; and, on Nov. 5, a rival pontiff was elected in the person of the ambitious Amadeus of Savoy, who now took the title of Felix V. (*See* BASEL, COUNCIL OF, and FELIX V.) Thus the assembly of Christendom at Basel had resulted, not in the reformation of the Church, but in a new schism!

The crime of this new schism was soon to be expiated by its perpetrators. The disinclination of sovereigns and peoples to a division, of the disastrous consequences of which the West had only lately had plentiful experiences, was so pronounced that the violent proceeding of the Basel fathers alienated from them the sympathies of nearly all who, till then, had leaned to their side. While the prestige of the schismatics waned, Eugenius IV. gained new friends; and on Sept. 28, 1443, his reconciliation with Alphonso of Naples enabled him to return to Rome.

During the chaos of the schism, France and Germany had adopted a semi-schismatic attitude: the former by the Pragmatic Sanction of Bourges (June 7, 1438); the latter by a declaration of neutrality in March 1438. The efforts of Aeneas Silvius Piccolomini brought matters into a channel more favourable to the Holy See; and an understanding with Germany was reached. This consummation was soon followed by the death of Eugenius (Feb. 23, 1447). No apter estimate of his character can be found than the words of Aeneas Silvius himself: "He was a great-hearted man; but his chief error was that he was a stranger to moderation, and regulated his actions, not by his ability, but by his wishes." From the charge of nepotism he was entirely exempt; and, to the present day, the purity of his life has never been impugned even by the voice of faction. He was a father to the poor and sick, in the highest sense of the word; and he left behind him an enduring monument in his amendment and regeneration, first of the religious orders, then of the clergy. Again, the patronage which he showed to art and artists was of the greatest importance.

On the death of Eugenius IV. the situation was menacing enough, but, to the surprise and joy of all, Tomaso Parentucelli, cardinal of Bologna, was elected without disturbance, as Pope Nicholas V. (1447–1455). With him the Christian Renaissance ascended the papal throne. He was the son of a physician from

Sarzana, who was not too well endowed with the gifts of fortune; and the boy, with all his talents, could only prosecute his studies at great personal sacrifices. He was possessed of a deep-seated enthusiasm for science and art, of a sincerely pious and idealistic temperament, and of an ardent love for the Church. After his ordination, his great learning and stainless life led him to office after office in the Church, each higher and more influential than the last. Not only did he love the studies of the humanist, but he himself was a Christian humanist. Yet among all his far-reaching plans for the encouragement of art and science, Nicholas V. had always the well-being of the Church primarily in view; and the highest goal of his pontificate, which inaugurated the Maecenatian era of the popedom, was to ennoble that Church by the works of intellect and art. It is astonishing to contemplate how much he achieved, during his brief reign, in the cause of the Renaissance in both art and literature. True, his designs were even greater, but his term of government was too short to allow of their actual execution. A gigantic plan was drawn out, with the assistance of the celebrated Alberti, for the reconstruction of the Leonine city, the Vatican and St. Peter's. The rebuilding of the last-named was rendered advisable by the precarious condition of the structure, but stopped short in the early stages. In the Vatican, however, Fiesole completed the noble frescoes, from the lives of St. Stephen and St. Lawrence, which are still preserved to us. Nicholas, again, lent the protection and encouragement of his powerful arm to science as well as art.

The Jubilee of 1450.—The fostering care of the science-loving pope extended also to the field of ecclesiastical literature; and the greatest importance attaches to the energy he developed as a collector of manuscripts and books. His agents travelled as far as Prussia, and even into the East. All this activity served to enrich the Vatican library, the foundation of which is for Nicholas V. an abiding title to fame. In political and ecclesiastical affairs he similarly manifested great vigour; and his extraordinarily pacific disposition did more than anything else towards diminishing the difficulties with which he had to contend on his entry upon office. An agreement was very quickly concluded with King Alphonso of Naples. In the empire the affairs of the Church were ameliorated—though not so quickly—by the Concordat of Vienna (1448). The Council of Basel was compelled to dissolve, and the anti-pope, Felix V., to abdicate: and, though even after the termination of the synod men like Jacob of Jüterbogk were found to champion ecclesiastical parliamentarianism and the more advanced ideas of Basel, they were confronted, on the other hand, by an array of redoubtable controversialists, who entered the lists to defend, both in speech and writing, the privileges of the Apostolic See. Among these, Torquemada, Rodericus Sancius de Arevalo, Capistrano and Piero del Monte were especially active for the restoration of the papacy.

The long-hoped cessation of civil war within the Church had now come, and Nicholas considered that the event could not better be celebrated than by the proclamation of a universal jubilee—an announcement which evoked a thrill of joy in the whole of Christendom.

It was the wish of the pope that the jubilee should be followed by a revival of religious life in all Christian countries. To put this project into execution, the Church opened her "treasuries of grace," connected with the jubilee dispensation, for the peculiar benefit of those nations that had suffered most from the turmoils of the last few decades, or were prevented from visiting the Eternal City. Nicholas of Cusa was nominated legate for Germany, and began the work of reformation by travelling through every province in Germany dispensing blessings. It was under Nicholas V. that the last imperial coronation was solemnized at Rome. There is a touch of tragedy in the fact that, in the following year, the pope saw his temporal sovereignty—even his life—threatened by a conspiracy hatched among the adherents of the pseudo-humanism. The prime mover in the plot, Stefano Porcaro, was executed. Nicholas had scarcely recovered from the shock, when news came of the capture of Constantinople by the Turks; and his efforts to unite the Christian Powers against the Muslims failed. This darkened the evening of his life, and he died in the night of March 24–25, 1455. From the universal standpoint of history the significance of Nicholas's pontificate lies in the fact that he put himself at the head of the artistic and literary Renaissance. By this means he introduced a new epoch in the history of the papacy and of civilization: Rome, the centre of ecclesiastical life, was now to become the centre of literature and art.

Calixtus III., Pius II., Paul II.—The short reign of the Spaniard, Alphonso de Borgia, as Pope Calixtus III. (1455–1458), is almost completely filled by his heroic efforts to arm Christendom for the common defence against Islam. Unfortunately all the warnings and admonitions of the pope fell on deaf ears, though he himself parted with his mitre and plate in order to equip a fleet against the Turks. The Mohammedans, indeed, were severely punished at Belgrade (1456), and in the sea-fight of Metelino (1457); but the indolence of the European princes, who failed to push home the victory, rendered the success abortive. Bitterly disillusioned, Calixtus died on Aug. 14, 1458.

When Aeneas Sylvius Piccolomini was elected pope as Pius II. (1458–1464), the papal throne was ascended by a man whose name was famous as poet, historian, humanist and statesman, and whose far-seeing eye and exact knowledge of affairs seemed peculiarly to fit him for his position. On the other hand, the troubled and not impeccable past of the new pontiff was bound to excite some misgiving; while, at the same time, severe bodily suffering had brought old age on a man of but 53 years. In spite of his infirmity and the brief duration of his reign, Pius II. accomplished much for the restoration of the prestige and authority of the Holy See. His indefatigable activity on behalf of Western civilization, now threatened with extinction by the Ottomans, excites admiration and adds an undying lustre to his memory. If we except the Eastern question, Pius II. was principally exercised by the opposition to papal authority which was gaining ground in Germany and France. In the former country the movement was headed by the worldly archbishop-elector Diether (*q.v.*) of Mainz; in the latter by Louis XI., who played the autocrat in ecclesiastical matters. In full consciousness of his high-priestly dignity he set his face against these and all similar attempts; and his zeal and firmness in defending the authority and rights of the Holy See against the attacks of the conciliar and national parties within the Church deserve double recognition, in view of the eminently difficult circumstances of that period. Nor did he shrink from excursions in the direction of reform, now become an imperative necessity. His attempt to reunite Bohemia with the Church was destined to failure; but the one great aim of the pope during his whole reign was the organization of a gigantic crusade—a project which showed a correct appreciation of the danger with which the Church and the West in general were menaced by the Crescent. Recurring time after time, with all his intellect and energy, to the realization of his scheme, he finally adopted the high-hearted resolve of placing himself at the head of the crusade. Tortured by bodily, and still more by mental suffering, the old pope reached Ancona. There he was struck down by fever; and on Aug. 15, 1464, death had released him from all his afflictions—a tragic close which has thrown a halo round his memory.

The humanist Pius II. was succeeded by a splendour-loving Venetian, Pietro Barbo, the nephew of Eugenius IV., who is known as Pope Paul II. (1464–1471). With his accession the situation altered; for he no longer made the Turkish war the centre of his whole activity, as both his immediate predecessors had done. Nevertheless, he was far from indifferent to the Ottoman danger. Paul took energetic measures against the principle of the absolute supremacy of the State as maintained by the Venetians and by Louis XI. of France; while in Bohemia he ordered the deposition of George Poděbrad (Dec. 1466). The widely diffused view that this pope was an enemy of science and culture is unfounded. It may be traced back to Platina, who, resenting his arrest, avenged himself by a biographical caricature. What the pope actually sought to combat by his dissolution of the Roman academy was simply the non-Christian tendency of the Renaissance, standing as it did on a purely pagan basis—"the stench of heathendom," as Dante described it. In other respects

Paul II. encouraged men of learning and the art of printing, and built the magnificent palace of San Marco, in which he established a noble collection of artistic treasures.

THE "POLITICAL POPES"

Pope Sixtus IV.—The long pontificate of the Franciscan Francesco della Rovere, under the title of Pope Sixtus IV. (1471–1484), displays striking contrasts of light and shade; and with him begins the series of the so-called "political popes." It remains a lamentable fact that Sixtus IV. frequently subordinated the Father of Christendom to the Italian prince, that he passed all bounds in the preferment of his own family, and in many ways deviated into all too worldly courses. The decay of ecclesiastical discipline grew to alarming proportions under Sixtus During his reign crying abuses continued and grew in spite of certain reforms.

The nepotism in which the pope indulged is especially inexcusable. His feud with Lorenzo de' Medici culminated in the Pazzi conspiracy, the tragic sequel to which was the assassination of Giuliano de'Medici (April 26, 1478). That the pope himself was guiltless of any share in that atrocious deed is beyond dispute; but it is deeply to be regretted that his name plays a part in the history of this conspiracy. Sixtus was far from blind to the Turkish peril, but here also he was hampered by the indifference of the secular powers. Again, the close of his reign was marked by the wars against Ferrará and Naples, and subsequently against Venice and the Colonnas; and these drove the question of a crusade completely into the background. In the affairs of the Church he favoured the mendicant orders, and declared against the cruel and unjust proceedings of the Spanish Inquisition He did splendid service to art and science. The Vatican library was enriched and thrown open for public use, Platina—the historian of the popes—receiving the post of librarian The city of Rome was transfigured. At the papal order there arose the Ponte Sisto, the hospital of San Spirito, Santa Maria del popolo, Santa Maria della pace, and finally the Sistine chapel, for the decoration of which the most famous Tuscan and Umbrian artists were summoned to Rome. This fresco-cycle, with its numerous allusions to contemporary history, is still preserved, and forms the noblest monument of the Rovere pope

Innocent VIII.—This reign (1484–1492) is mainly occupied by his troubles with the faithless Ferdinand of Naples These sprang from his participation in the War of the Barons; but to this the pope was absolutely compelled Innocent's bull concerning witchcraft (Dec. 5, 1484) has brought upon him many attacks. But this bull contains no sort of dogmatic decision on the nature of sorcery. The very form of the bull, which merely sums up the various items of information that had reached the pope, is enough to prove that the decree was not intended to bind anyone to belief in such things Moreover the bull contained no essentially new regulations as to witchcraft It is absurd to make this document responsible for the introduction of the bloody persecution of witches; for, according to the *Sachsenspiegel*, the civil law already punished sorcery with death The action of Innocent VIII. was simply limited to defining the jurisdiction of the inquisitors with regard to magic

Alexander VI.—On the death of Innocent VIII. (July 25, 1492), simoniacal intrigues succeeded in procuring the election of Cardinal Rodrigo Borgia, a man of the most abandoned morals, who did not change his mode of life when he ascended the throne as Pope Alexander VI. (1492–1503). The beginning of his reign was not unpromising; but all too soon that nepotism began which attained its height under this Spanish pope, and dominated his whole pontificate A long series of scandals resulted The cardinals opposed to Alexander, headed by Giuliano della Rovere, found protection and support with Charles VIII. of France, who laid claim to Naples. In prosecution of this design the king appeared in Italy in the autumn of 1494, pursued his triumphant march through Lombardy and Tuscany, and, on Dec. 31, entered Rome. Charles had the word *reform* perpetually on his lips; but it could deceive none who were acquainted with the man. At first he threatened Alexander with deposition: but on Jan 15, 1495, an agreement was concluded between pope and king

While the French were marching on Naples there arose a hostile coalition which compelled them to beat a hasty retreat—the Holy League of March 1495. All their conquests were lost; and the pope now determined to chastise the Orsini family, whose treachery had thrown him into the hands of the French. The project miscarried, and on Jan. 25, 1497, the papal forces were defeated.

In June occurred the mysterious assassination of the duke of Gandia, which appeared for a while to mark the turning-point in Alexander's life. For some time he entertained serious thoughts of reformation; but the matter was first postponed and then forgotten. The last state now became worse than the first, as Alexander fell more and more under the spell of the infamous Cesare Borgia. One scandal followed hard on the other, and opposition naturally sprang up Unfortunately, Savonarola, the head of that opposition, transgressed all bounds in his well-meant zeal He refused to yield the pope that obedience to which he was doubly pledged as a priest and the member of an order Even after his excommunication (May 12, 1497) he continued to exercise the functions of his office, under the shelter of the secular arm. In the end he demanded a council for the deposition of the pope His fall soon followed, when he had lost all ground in Florence; and his execution on May 23, 1498, freed Alexander from a formidable enemy (*see* SAVONAROLA).

After the death of Charles VIII. Alexander entered into an agreement and alliance with his successor, Louis XII. The fruits of this compact were reaped by Cesare Borgia, who resigned his cardinal's hat, became duke of Valentinois, annihilated the minor nobles of the papal State, and made himself the true dictator of Rome. His soaring plans were destroyed by the death of Alexander VI, who met his end on Aug 18, 1503

The only bright pages in the dark chapter of Alexander's popedom are his efforts on behalf of the Turkish war (1499–1502), his activity for the diffusion of Christianity in America, and his judicial awards (May 3–4, 1493) on the question of the colonial empires of Spain and Portugal, by which he avoided a bloody war It is folly to speak of a donation of lands which did not belong to the pope, or to maintain that the freedom of the Americans was extinguished by the decision of Alexander VI The expression "donation" simply referred to what had already been won *under just title:* the decree contained a deed of gift, but it was an adjustment between the Powers concerned and the other European princes, not a parcelling out of the New World and its inhabitants. The monarchs on whom the *privilegium* was conferred received a right of priority with respect to the provinces first discovered by them Precisely as to-day inventions are guarded by patents, and literary and artistic creations by the law of copyright, so, at that period, the papal bull and the protection of the Roman Church were an effective means for ensuring that a country should reap where she had sown and should maintain the territory she had discovered and conquered by arduous efforts; while other claimants, with predatory designs, were warned back by the ecclesiastical censorship. In the Vatican the memory of Alexander VI is still perpetuated by the Appartamenta Borgia decorated by Pinturicchio with magnificent frescoes, and since restored by Leo XIII

Julius II.—The short reign of Pius III. (Sept. 22–Oct. 18, 1503) witnessed the end of Cesare Borgia's dominion. As early as Nov. 1 Cardinal Giuliano della Rovere was elected by the conclave as Julius II. (1503–1513). He was one of those personalities in which everything transcends the ordinary scale He was endowed with great force of will, indomitable courage, extraordinary acumen, heroic constancy and a discriminating instinct for everything beautiful A nature formed on great broad lines—a man of spontaneous impulses carrying away others as he himself was carried away, a genuine Latin in the whole of his being—he belongs to those imposing figures of the Italian Renaissance whose character is summarized in contemporary literature by the word *terribile*, which is best translated "extraordinary" or "magnificent."

As cardinal, Julius II had been the adversary of Alexander VI as pope he stood equally in diametrical opposition to his pred-

ecessor. The Borgia's foremost thought had been for his family; Julius devoted his effort to the Church and the papacy. His chief idea was to revive the world-dominion of the popedom, but first to secure the independence and prestige of the Holy See on the basis of a firmly established and independent territorial sovereignty. Thus two problems presented themselves: the restoration of the papal State, which had been reduced to chaos by the Borgias; and the liberation of the Holy See from the onerous dependence on France—in other words, the expulsion of the French "barbarians" from Italy. His solution of the first problem entitles Julius II. to rank with Innocent III. and Cardinal Albornoz as the third founder of the papal State. His active prosecution of the second task made the Rovere pope, in the eyes of Italian patriots, the hero of the century. At the beginning of the struggle Julius had to endure many a hard blow; but his courage never failed—or, at most, but for a moment—even after the French victory at Ravenna, on Easter Sunday 1512. In the end the Swiss saved the Holy See; and, when Julius died the power of France had been broken in Italy, although the power of Spain had taken its place.

The conflict with France led to a schism in the college of cardinals, which resulted in the *conciliabulum* of Pisa. Julius adroitly checkmated the cardinals by convening a general council, which was held in the Lateran. This assembly was also designed to deal with the question of reform, when the pope was summoned from this world (Feb. 20–21, 1513). Of his ecclesiastical achievements the bull against simony at papal elections deserves the most honourable mention. Again, by his restoration of the papal State, after the frightful era of the Borgias, Julius became the saviour of the papal power. But this does not exhaust his significance; he was, at the same time, the renewer of the papal Maecenate in the domain of art. It is to his lasting praise that he took into his service the three greatest artistic geniuses of the time—Bramante, Michelangelo and Raphael—and entrusted them with congenial tasks. Bramante drew out the plan for the new cathedral of St. Peter and the reconstruction of the Vatican. On April 18, 1506, the foundation-stone of the new St. Peter's was laid; 120 years later, on Nov. 18, 1626, Urban VIII. consecrated the new cathedral of the world, on which 20 popes had laboured, in conjunction with the first architects of the day, modifying in many points the grandiose original design of Bramante, and receiving the contributions of every Christian land (*see* VATICAN).

Leo X.—As so often occurs in the history of the papacy, Julius II. was followed by a man of an entirely different type—Leo X. (1513–1521). Though not yet 37 years of age, Giovanni de' Medici, distinguished for his generosity, mildness and courtesy, was elevated to the pontifical chair by the adroit manoeuvres of the younger cardinals. His policy—though officially he declared his intention of following in the steps of his predecessor—was at first extremely reserved. His ambition was to play the rôle of peacemaker, and his conciliatory policy achieved many successes. Thus, in the very first year of his reign, he removed the schism which had broken out under Julius II. As a statesman Leo X. often walked by very crooked paths; but the reproach that he allowed his policy to be swayed exclusively by his family interests is unjustified. It may be admitted that he clung to his native Florence and to his family with warm affection; but the really decisive factor which governed his attitude throughout was his anxiety for the temporal and spiritual independence of the Holy See. The conquest of Milan by the French led to a personal interview at Bologna, where the "concordat" with France was concluded. This document annulled the pragmatic sanction of Bourges, with its schismatic tendencies, but at the same time confirmed the preponderating influence of the king upon the Gallican Church—a concession which in spite of its many dubious aspects at least made the sovereign the natural defender of the Church and gave him the strongest motive for remaining Catholic. The war for the duchy of Urbino (1516–17) entailed disastrous consequences, as from it dates the complete disorganization of papal finance. It was, moreover, a contributing cause of the conspiracy of Cardinal Petrucci, the suppression of which was followed (July, 1517) by the creation of 31 new cardinals in one day. This—the greatest of recorded creations—turned the scale once and for all in favour of the papal authority and against the cardinals. The efforts of Leo to promote a crusade, which fall mainly in the years 1517 and 1518, deserve all recognition, but very various opinions have been held as to the attitude of the pope towards the imperial election consequent on the death of Maximilian I. The fundamental motive for his proceedings at that period was not nepotistic tendencies—which doubtless played their part, but only a secondary one—but his anxiety for the moral and temporal independence of the Holy See. For this reason Leo, from the very first, entertained no genuine desire for the selection either of Charles V. or Francis I. of France. By playing off one against the other he succeeded in holding both in suspense, and induced them to conclude agreements safeguarding the pope and the Medici. Of the two, the French king appeared the less dangerous, and the result was that Leo championed his cause with all his energies. Not till the eleventh hour, when the election of the Habsburg, to whom he was entirely opposed, was seen to be certain did he give way. He thus at least avoided an open rupture with the new emperor—a rupture which would have been all the more perilous on account of the religious revolution now imminent in Germany. There the great secession from Rome was brought about by Martin Luther; but, in spite of his striking personality, the upheaval which was destined to shatter the unity of the Western Church was not his undivided work. True, he was the most powerful agent in the destruction of the existing order; but, in reality, he merely put the match to a pile of inflammable materials which had been collecting for centuries. (*See* REFORMATION.) A main cause of the cleavage in Germany was the position of ecclesiastical affairs, which—though by no means hopeless—yet stood in urgent need of emendation, and, combined with this, the deeply resented financial system of the Curia. Thus Luther assumed the leadership of a national opposition, and appeared as the champion who was to undertake the much-needed reform of abuses which clamoured for redress. The occasion for the schism was given by the conflict with regard to indulgences, in the course of which Luther was not content to attack actual grievances, but assailed the Catholic doctrine itself. In June 1518 the canonical proceedings against Luther were begun in Rome; but, owing to political influences, only slow progress was made. It was not till June 15, 1520, that his new theology was condemned by the bull *Exsurge*, and Luther himself threatened with excommunication—a penalty which was only enforced owing to his refusal to submit, on Jan. 3, 1521.

The state of Germany, together with the unwise behaviour of Francis I., compelled Leo X. to side with Charles V. against the French king; and the united forces of the empire and papacy had achieved the most brilliant success in upper Italy, when Leo died unexpectedly, on Dec. 1, 1521. The character of the first Medicean pope shows a peculiar mixture of noble and ignoble qualities. With an insatiable love of pleasure he combined a certain external piety and a magnificent generosity in his charities. His financial administration was disastrous, and led simply to bankruptcy. On music, hunting, expensive feasts and theatrical performances money was squandered, while, with unexampled optimism, the pope was blind to the deadly earnestness of the times.

As the Maecenas of Science and Literature Leo has been over-praised. The genuine significance of Leo lies rather in the stimulus which he gave. From this point of view his deserts are undoubtedly great; and for that reason he possesses an indefeasible right to a certain share in the renown of the papacy as a civilizing agent of the highest rank.

As a patron of art Leo occupies a more exalted plane. In this domain the first place must be assigned to the splendid achievements of Raphael, whom the pope entrusted with new and comprehensive commissions—the *Stanza dell' incendio,* the Logge and the tapestry-cartoons, the originals of the last named being now in London. But, though illuminated by the rays of art, and loaded with the exuberant panegyrics of humanists and poets, the reign of the first Medicean pontiff, by its unbounded devotion to purely secular tendencies and its comparative neglect of the Church herself proved disastrous for the see of St. Peter.

REFORMATION AND COUNTER-REFORMATION

The healing successor to this scion of the Medici was Adrian VI. (1522–1523)—a man who saw his noblest task, not in an artistic Maecenate, nor in the prosecution of political designs, but in the reform of the Church in all its members. Careless of the glories of Renaissance art, a stranger to all worldly instincts, the earnest Netherlander inscribed on his banner the healing of the moral ulcers, the restoration of unity to the Church—especially in Germany—and the preservation of the West from the Turkish danger. How clearly he read the causes of religious decadence, how deeply he himself was convinced of the need of trenchant reform, is best shown by his instructions to Chieregati, his nuncio to Germany, in which he laid the axe to the root of the tree with unheard-of freedom. Unfortunately, it was all in vain. Luther and his adherents overwhelmed the noble pope with unmeasured abuse. The two great rivals, Francis I. and Charles V., were deaf to his admonitions to make common cause against the Turks. The intrigues of Cardinal Soderini led to a breach with France and drove Adrian into the arms of the imperial league. Soon afterwards, on Sept. 14, 1523, he died. Long misunderstood and slandered, Adrian VI., the last German pope, is now by all parties ranked among the most revered and most worthy of the popes. No one now denies that he was one of those exceptional men, who without self-seeking spend their lives in the service of a cause and fight bravely against the stream of corruption.

Clement VII.—Under Leo. X. Cardinal Giulio de'Medici, the cousin of that pope, had already exercised a decisive influence upon Catholic policy; and the tiara now fell to his lot. Clement VII. (1523–1534) was soon to discover the weight of the crown which he had gained. The international situation was the most difficult imaginable, and altogether beyond the powers of the timorous, vacillating and irresolute Medicean pope. His determination to stand aloof from the great duel between Francis I. and Charles V. failed him at the first trial. He had not enough courage and perspicacity to await in patience the result of the race between France and Germany for the duchy of Milan—a contest which was decided at Pavia (Feb. 24, 1525). The haughty victors found Clement on the side of their opponent, and he was forced into an alliance with the emperor (April 1, 1525). The overweening arrogance of the Spaniards soon drove the pope back into the ranks of their enemies. On May 22, 1526, Clement acceded to the League of Cognac, and joined the Italians in their struggle against the Spanish supremacy. This step he was destined bitterly to repent. The tempest descended on the pope and on Rome with a violence which cannot be paralleled, even in the days of Alaric and Genseric, or of the Norman, Robert Guiscard. On May 6, 1527, the Eternal City was stormed by the Imperial troops and subjected to appalling devastation in the famous sack. Clement was detained for seven months as a prisoner in the castle of St. Angelo. He then went into exile at Orvieto and Viterbo, and only on Oct. 6, 1528, returned to his desolate residence. After the fall of the French dominion in Italy he made his peace with the emperor at Barcelona (June 29, 1529); in return for which he received the assistance of Charles in re-establishing the rule of the Medici in Florence. During the Italian turmoil the schism in Germany had made such alarming progress that it now proved impossible to bridge the chasm. With regard to the question of a council the pope was so obsessed by doubts and fears that he was unable to advance a single step; nor, till the day of his death could he break off his pitiful vacillation between Charles V. and Francis I. While large portions of Germany were lost to the Church the revolt from Rome proceeded apace in Switzerland and the Scandinavian countries. To add to the disasters, the divorce of Henry VIII. led to the English schism. At the death of Clement (Sept. 25, 1534), the complete disruption of the Church seemed inevitable.

Paul III.—When all seemed lost salvation was near. Even under the two Medici popes the way which was to lead to better things had been silently paved within the Church. Under Leo X. himself there had been formed in Rome, in the Oratory of the Divine Love, a body of excellent men of strictly Catholic sentiments. It was by members of this Oratory—especially St. Gaetano di Tiene, Carafa (later Paul IV.), and the great bishop of Verona, Giberti—that the foundations of the Catholic reformation were laid. Under Clement VII. the establishment of new religious orders—Theatines, Somascians, Barnabites and Capuchins—had sown the seeds of a new life in the ancient Church. The harvest was reaped during the long pontificate of the Farnese pope, Paul III. (1534–1549). With his accession devotion to religion and the Church began to regain their old mastery. True, Paul III. was not a representative of the Catholic reformation, in the full sense of the words. In many points, especially his great nepotism—witness the promotion of the worthless Pier Luigi Farnese—he remained, even as pope, a true child of the Renaissance period in which he had risen to greatness. Nevertheless he possessed the necessary adaptability and acumen to enable him to do justice to the demands of the new age, which imperatively demanded that the interests of the Church should be the first consideration. Thus, in the course of his long reign he did valuable work in the cause of the Catholic reformation and prepared the way for the Catholic restoration. It was he who regenerated the college of cardinals by leavening it with men of ability, who took in hand the reform of the Curia, confirmed the Jesuit order, and finally brought the Council of Trent into existence (sessions I.–X. of the council, first period, 1545–1549). In order to check the progress of Protestantism in Italy Paul III. founded the Congregation of the Inquisition (1542). Political differences, and the transference of the council to Bologna in 1547, brought the pope into sharp collision with the emperor, who now attempted by means of the *Interim* to regulate the religious affairs of Germany according to his wishes—but in vain. The disobedience of his favourite Ottavio hastened the death of the old pope (Nov. 10, 1549).

Under the Farnese pope art enjoyed an Indian summer. The most important work for which he was responsible is the "Last Judgment" of Michelangelo in the Sistine chapel. In 1547 Michelangelo was further entrusted with the superintendence of the reconstruction of St. Peter's. He utilized his power by rejecting the innovations of Antonio da Sangallo, saved the plan of Bramante, and left behind him sufficient drawings to serve the completion of the famous cupola. Titian painted Paul's portrait, and Guglielmo della Porta cast the bronze statue which now adorns his grave in St. Peter's.

Julius III.—After a protracted conclave Giovanni Maria del Monte was elected as Pope Julius III. (1550–1555). He submitted to the emperor's demands and again convened the council (sessions XI.–XVI., second period), but was obliged to suspend it on April 22, 1552, in consequence of the war between Charles V. and Maurice of Saxony. From this time onwards the pope failed to exhibit requisite energy. In his beautiful villa before the Porta del Popolo he sought to banish political and ecclesiastical anxieties from his mind. Yet even now he was not wholly inactive. The religious affairs of England especially engaged his attention; and the nomination of Cardinal Pole as his legate to that country, on the death of Edward VI. (1553), was an extremely adroit step. That the measure was fruitless was not the fault of Julius III., who died on March 23, 1555.

The feeble régime of Julius had made it evident that a pope of another type was necessary if the papal see were to preserve the moral and political influence which it had regained under Paul III. On April 10, 1555, after a conclave which lasted five days, the reform party secured the election of the distinguished Marcellus II. Unfortunately, on May 1, an attack of apoplexy cut short the life of this pope, who seemed peculiarly adapted for the reformation of the Church.

Paul IV.—On May 23, 1555, Gian Pietro Carafa, the strictest of the strict, was elected under the title of Paul IV. (1555–1559). Though already 79 years of age, he was animated by the fiery zeal of youth, and he employed the most drastic methods for executing the necessary reforms and combating the advance of Protestantism. Always an opponent of the Spaniards, Paul IV., in the most violent and impolitic fashion, declared against the Habsburgs. The conflict with the Colonna was soon followed by the war with Spain, which, in spite of the French alliance, ended so disastrously, in 1557, that the pope hencefor-

ward devoted himself exclusively to ecclesiastical affairs. The sequel was the end of the nepotism and the relentless prosecution of reform within the Church. Protestantism was successfully eradicated in Italy; but the pope failed to prevent the secession of England. After his death the rigour of the Inquisition gave rise to an insurrection in Rome. The Venetian ambassador says of Paul IV. that, although all feared his strictness, all venerated his learning and wisdom.

The reaction against the iron administration of Paul IV. explains the fact that, after his decease, a more worldly-minded pope was again elected in the person of Cardinal Giovanni Angelo de' Medici—Pius IV. (1559–1565). In striking contrast to his predecessor he favoured the Habsburgs. A suit was instituted against the Carafa, and Cardinal Carafa was even executed. To his own relatives, however, Pius IV. accorded no great influence, the advancement of his distinguished nephew, Carlo Borromeo (*q.v.*) being singularly fortunate for the Church. The most important act of his reign was the reassembling of the Council of Trent (sessions XVII.–XXV., third period, 1562–63). It was an impressive moment, when, on Dec. 4, 1563, the great oecumenical synod of the Church came to a close. Till the last it was obliged to contend with the most formidable difficulties: yet it succeeded in effecting many notable reforms and in illuminating and crystallizing the distinctive doctrines of Catholicism. The breach with the Protestant Reformation was now final, and all Catholics felt themselves once more brought into intimate connection with the centre of unity at Rome. (*See* TRENT, COUNCIL OF.)

THE GREAT AGE OF CATHOLIC RESTORATION

Three successors of Pius IV. inaugurate the heroic age of the Catholic restoration. All three were of humble extraction, and sprang from the people in the full sense of the phrase. Pius V. (1566–1572), formerly Michele Ghisleri and a member of the Dominican order, observed even as pope the strictest rules of the brotherhood, and was already regarded as a saint by his contemporaries. For Rome, in especial, he completed the task of reform. The Curia, once so corrupt, was completely metamorphosed, and once more became a rallying point for men of stainless character, so that it produced a profound impression even on non-Catholics; while the original methods of St. Philip Neri had a profound influence on the reform of popular morals. In the rest of Italy also Pius V. put into execution the reformatory decrees of Trent. In 1566 he gave publicity to the Tridentine catechism; in 1568 he introduced the amended Roman breviary; everywhere he insisted on strict monastic discipline, and the compulsory residence of bishops within their sees. At the same period Carlo Borromeo made his diocese of Milan the model of a reformed bishopric. The pope supported Mary Stuart with money; his troops assisted Charles IX. of France against the Huguenots; and he lent his aid to Philip II. against the Calvinists of the Netherlands. But his greatest joy was that he succeeded where Pius II. had failed, despite all his efforts, by bringing to a head an enterprise against the Turks—then masters of the Mediterranean. He negotiated an alliance between the Venetians and Spaniards, contributed ships and soldiers, and secured the election of Don John of Austria to the supreme command. He was privileged to survive the victory of the Christians at Lepanto; but on May 1 in the following year he died, as piously as he had lived. The last pope to be canonized, his pontificate marks the zenith of the Catholic reformation.

The renewed vigour which this internal reformation had infused into the Church was now manifest in its external effects; and Pius V., the pope of reform, was followed by the popes of the Catholic restoration. These, without intermitting the work of reformation, endeavoured by every means to further the outward expansion of Catholicism. On the one hand missions were despatched to America, India, China and Japan: on the other, a strenuous attempt was made to reannex the conquests of Protestantism. In a word, the age of the Catholic restoration was beginning—a movement which has been misnamed the counter-Reformation. In this period, the newly created religious orders were the right arm of the papacy, especially the Jesuits and the Capuchins. In place of the earlier supineness, the battle was now joined all along the line. Everywhere, in Germany and France, in Switzerland and the Low Countries, in Poland and Hungary, efforts were made to check the current of Protestantism and to re-establish the orthodox faith. This activity extended to wider and wider areas, and enterprises were even set on foot to regain England, Sweden and Russia for the Church.

Gregory XIII.—This universal outburst of energy which lasted until the middle of the 17th century, found one of its most zealous promotors in Ugo Boncompagni—Pope Gregory XIII. (1572–1585.) (*See* Pastor, *Geschichte der Päpste,* ix., 1923.) Though not of an ascetic nature, he followed unswervingly in the path of his predecessors by consecrating his energies to the translation of the reformatory decrees into practice. At the same time he showed himself anxious to further the cause of ecclesiastical instruction and Catholic science. He created a special congregation to deal with episcopal affairs, and organized the congregation of the index, instituted by Pius V. On behalf of the diffusion of Catholicism throughout the world he spared no efforts; and wherever he was able he supported the great restoration. He was especially active in the erection and encouragement of educational institutions. In Rome he founded the splendid college of the Jesuits; and he patronized the *collegium germanicum* of St. Ignatius; while, at the same time, he found means for the endowment of English and Irish colleges. In fact, his generosity for the cause of education was so unbounded that he found himself in financial difficulties. Gregory did good service, moreover, by his reform of the calendar which bears his name, by his emended edition of the *Corpus iuris canonici* and by the creation of nunciatures.

Sixtus V.—Felice Peretti, cardinal of Montalto, a member of the Franciscan order, succeeded Gregory XIII. on the Apostolic throne as Sixtus V. (April 1585–Aug. 1590). His first task was the extirpation of the bandits and the restoration of order within the papal State. In the course of a year the drastic measures of this born ruler made this State the safest country in Europe. He introduced a strictly ordered administration, encouraged the sciences, and enlarged the Vatican library, housing it in a splendid building erected for the purpose in the Vatican itself. He was an active patron of agriculture and commerce: he even interested himself in the draining of the Pontine marshes. The financial system he almost completely reorganized. With a boldness worthy of Julius II., he devised the most gigantic schemes for the annihilation of the Turkish empire and the conquest of Egypt and Palestine. Elizabeth of England he wished to restore to the Roman obedience either by conversion or by force; but these projects were shattered by the destruction of the Spanish Armada. Down to his death the pope kept a vigilant eye on the troubles in France. Here his great object was to save France for the Catholic religion, and, as far as possible, to secure her position as a power of the first rank.

In Rome itself Sixtus displayed extraordinary activity. The Pincian, the Esquiline, and the south-easterly part of the Caelian hills received essentially their present form by the creation of the via Sistina, Felice, delle Quattro Fontane, di Sta Croce in Gerusalemme, etc.; by the buildings at Sta. Maria Maggiore, the Villa Montalto, the reconstruction of the Lateran, and the aqueduct of the Felice, which partially utilized the Alexandrina and cost upwards of 300,000 scudi. The erection of the obelisks of the Vatican, the Lateran, the Piazza del Popolo and the square behind the tribune of Sta. Maria Maggiore lent a lustre to Rome which no other city in the world could rival. The columns of Trajan and Antoninus were restored and bedecked with gilded statues of the Apostles; nor was this the only case in which the high-minded pope made the monuments of antiquity subservient to Christian ideas. His principal architect was Domenico Fontana, who, with Giovanni Giacoma della Porta, completed the uniquely beautiful cupola of St. Peter's which had already been designed by Michelangelo in a detailed model. In Santa Maria Maggiore the pope erected the noble Sistine chapel, in which he was laid to rest. Indeed, the monumental character of Rome dates from this era. (*See* Pastor, *Geschichte der Päpste, x.* [1926].)

The organizing activity of Sixtus V. was not, however, restricted to the Eternal City, but extended to the whole administration of the Church. The number of cardinals was fixed at 70—six bishops, 50 priests and 14 deacons. In 1588 followed the new regulations with respect to the Roman Congregations, which henceforth were to be 15 in number. Thus the pope laid the foundations of that wonderful and silent engine of universal government by which Rome still rules the Catholics of every land

When we reflect that all this was achieved in a single pontificate of but five years' duration, the energy of Sixtus V appears simply astounding He was, without doubt, by far the most important of the post-Tridentine popes. (L. v. P.)

IV. FROM 1590 TO THE 20th CENTURY

The characteristic features of this period are the splendid progress made by the Catholic Restoration, and the subsequent humiliation of the papacy during the period of absolutism. The influence of the papacy was at a low ebb during the age of enlightenment and the French Revolution. In the 19th century, however, it succeeded, in spite of many obstacles and notwithstanding the loss of the Papal States, in regaining its internal and external strength and authority, while its activities in favour of peace during the World War raised it to a position of great dignity and power.

Urban VII., Gregory XIV., Innocent IX.—The three popes who, in 1590 and 1591, succeeded the great Sixtus V. held office for very short periods. Urban VII. (Castagna) for 13 days, Gregory XIV (Sfondrati) for rather more than ten months, and Innocent IX (Facchinetti) for two months All three were zealous reformers Gregory, who took part in the struggle against Henry of Navarre, was a patron of the great musician Palestrina.

Clement VIII., 1592–1605.—Clement VIII, who was a member of the Florentine family of the Aldobrandini, was of a pious and peaceable disposition, and a hard worker. Following the example of Pius V, he made untiring efforts to increase the internal strength of the Church, to remedy abuses, to reform the religious Orders, and to select worthy candidates for the College of Cardinals and Italian bishoprics. In the interests of purity of doctrine he favoured the Inquisition, re-issued the Index, and had the Clementine Bible printed—although the latter measure was premature He also improved the liturgical books and completed the reform of the breviary The obstinate heretic and apostate Giordano Bruno was burnt in 1600 Clement also prepared the way for the solution which his successors found for the dogmatic dispute between the Dominicans and the Jesuits concerning the efficacy of grace. A great part was played in the revival of Catholicism in Germany by the Jesuit schools which he developed, particularly the Collegium Germanicum in Rome, and by the Capuchin monks. The Counter-Reformation also made great progress in Switzerland, the Spanish Netherlands, Poland and France

The pope was faced with special difficulties in England, where Queen Elizabeth increased the severity of the legislation against Catholic priests. The help of Spain having proved useless, Clement endeavoured to preserve what remained of Catholic England by the peaceful means of preaching and education Schools for the training of Englishmen abroad were founded in Spain and Flanders, and after the death of Cardinal Allen an arch-priest, who was not consecrated as a bishop, was appointed for England. Seminaries for the training of Scottish and Irish priests were also instituted on the continent, including the Scottish College which was founded in Rome in 1600.

The spread of Christianity made great progress in China, where the gifted Jesuit Matteo Ricci was received by the emperor, and also in Japan, the Philippines, Persia, Abyssinia, West Africa and America. Clement created a special authority for the supervision of missions. His work in averting the Turkish peril recalls the great days of the middle ages The agreement which he reached with Henry IV. of France after the latter's reception into the Catholic Church was one of the turning-points of European history. It prevented the victory of Protestantism in Western and Central Europe, and the Holy See became more independent of Spain and was therefore once more able to mediate between the Powers in the interests of peace as in the middle ages. It was as a result of its recovery of political independence that the papacy was able to act as mediator for the conclusion of peace between France and Spain in 1598. In the Papal States, which were now enlarged by the acquisition of Ferrara, and in which the nobility led an inactive and vicious life, Clement enforced order; it was at this time that Beatrice Cenci suffered the extreme penalty for the murder of her father. Clement was seconded in his work for the encouragement of learning by the great Cardinals Baronius and Bellarmine His name is also connected with that of Torquato Tasso, whose *Gerusalemme Liberata* reflects the renewed vitality of the Church The Jubilee Year of 1600, when over a million pilgrims visited Rome, clearly showed how much of its former vitality the Catholic Church had recovered.

THE 17TH CENTURY
